An ant is a wise creature for itself; but it is a shrewd thing, in an orchard, or garden. And certainly, men that are great lovers of themselves, waste the public. Divide with reason between self-love, and society: and be so true to thy self, as thou be not false to others; specially to thy king, and country. It is a poor centre of a man's actions, himself. It is right earth. For that only stands fast upon his own centre; whereas all things that have affinity with the heavens, move upon the centre of another, which they benefit. The referring of all to a man's self, is more tolerable in a sovereign prince; because themselves are not only themselves; but their good and evil, is at the peril of the public fortune. But it is a desperate evil in a servant to a prince, or a citizen in a republic. For whatsoever affairs pass such a man's hands, he crooketh them to his own ends: which must needs be often eccentric to the ends of his master, or state. Therefore let princes, or states, choose such servants as have not this mark; except they mean their service should be made but the accessory. That which maketh the effect more pernicious, is that all proportion is lost. It were disproportion enough, for the servant's good to be preferred before the master's; but yet it is a greater extreme, when a little good of the servant shall carry things against a great good of the master's. And yet that is the case of bad officers, treasurers, ambassadors, generals, and other false and corrupt servants; which set a bias upon their bowl, of their own petty ends, and envies, to the overthrow of their master's great and important affairs. And for the most part, the good such servants receive is after the model of their own fortune; but the hurt they sell for that good is after the model of their master's fortune. And certainly, it is the nature of extreme self-lovers; as they will set an house on fire, and it were but to roast their eggs: and yet these men, many times, hold credit with their masters, because their study is but to please them, and profit themselves: and for either

respect, they will abandon the good of their affairs.

Wisdom for a man's self, is in many branches thereof, a depraved thing. It is the wisdom of rats, that will be sure to leave a house, somewhat before it fall. It is the wisdom of the fox, that thrusts out the badger, who digged and made room for him. It is the wisdom of crocodiles, that shed tears, when they would devour. But that which is specially to be noted is that those which (as Cicero says of Pompey) are *sui amantes sine rivali*,^[1] are many times unfortunate. And whereas they have all their time sacrificed to themselves, they become in the end themselves sacrifices to the inconstancy of fortune; whose wings they thought, by their self-wisdom, to have pinioned.

^[1] lovers of themselves without a rival

25 Of Innovations

As the births of living creatures, at first, are ill shapen: so are all innovations, which are the births of time. Yet notwithstanding, as those that first bring honour into their family, are commonly more worthy, than most that succeed: so the first precedent (if it be good) is seldom attained by mutation. For ill, to man's nature, as it stands perverted, hath a natural motion, strongest in continuance: but good, as a forced motion, strongest at first. Surely every medicine is an innovation; and he that will not apply new remedies, must expect new evils: for time is the greatest innovator: and if time, of course, alter things to the worse, and wisdom and counsel shall not alter them to the better, what shall be the end? It is true, that what is settled by custom, though it be not good, yet at least it is fit. And those things, which have long gone together, are as it were confederate within themselves: whereas new things piece not so well; but though they help by their utility, yet they trouble by their inconformity. Besides, they are like strangers; more admired, and less favoured. All this is true, if time stood still; which contrariwise moveth so round, that a froward retention of custom is as turbulent a thing as an innovation: and they that reverence too much old times, are but a scorn to the new. It were good therefore, that men in their innovations, would follow the example of time itself; which indeed innovated greatly, but quietly, and by degrees, scarce to be perceived: for otherwise, whatsoever is new, is unlocked for; and ever it mends some, and pairs other: and he that is holpen, takes it for a fortune, and thanks the time; and he that is hurt, for a wrong, and imputeth it to the author. It is good also, not to try experiments in states, except the necessity be urgent, or the utility evident: and well to beware, that it be the reformation, that draweth on the change; and not the desire of change, that pretendeth the reformation. And lastly, that the novelty, though it be not rejected, yet be held for a suspect: and, as the

scripture saith; that we make a stand upon the ancient way, and then look about us, and discover what is the straight and right way, and so to walk in it.

26 Of Dispatch

Affected dispatch is one of the most dangerous things to business that can be. It is like that, which the physicians call predigestion, or hasty digestion; which is sure to fill the body full of crudities, and secret seeds of diseases. Therefore, measure not dispatch by the times of sitting, but by the advancement of the business. And as in races, it is not the large stride, or high lift, that makes the speed: so in business, the keeping close to the matter, and not taking of it too much at once, procureth dispatch. It is the care of some, only to come off speedily for the time; or to contrive some false periods of business, because they may seem men of dispatch. But it is one thing, to abbreviate by contracting, another by cutting off: and business so handled at several sittings or meetings, goeth commonly backward and forward, in an unsteady manner. I knew a wise man, that had it for a by-word, when he saw men hasten to a conclusion; Stay a little, that we may make an end the sooner.

On the other side, true dispatch is a rich thing. For time is the measure of business, as money is of wares: and business is bought at a dear hand, where there is small dispatch. The Spartans, and Spaniards, have been noted to be of small dispatch; *Mi venga la muerta de Spagna*; Let my death come from Spain; for then it will be sure to be long in coming.

Give good hearing to those that give the first information in business; and rather direct them in the beginning, than interrupt them in the continuance of their speeches: for he that is put out of his own order, will go forward and backward, and be more tedious while he waits upon his memory, than he could have been, if he had gone on in his own course. But sometimes it is seen, that the moderator is more troublesome than the actor.

Iterations are commonly loss of time: but there is no such gain of time, as to iterate often the state of the question: for it chaseth away many a frivolous speech, as it is coming forth. Long and curious speeches are as fit for dispatch, as a robe or mantle with a long train, is for race. Prefaces, and passages, and excusations, and other speeches of reference to the person, are great wastes of time; and though they seem to proceed of modesty, they are bravery. Yet beware of being too material, when there is any impediment or obstruction in men's wills; for pre-occupation of mind ever requireth preface of speech; like a fomentation to make the unguent enter.

Above all things, order, and distribution, and singling out of parts, is the life of dispatch; so as the distribution be not too subtle: for he that doth not divide will never enter well into business; and he that divideth too much will never come out of it clearly. To choose time is to save time; and an unseasonable motion is but beating the air. There be three parts of business: the preparation; the debate, or examination; and the perfection. Whereof, if you look for dispatch, let the middle only be the work of many, and the first and last the work of few. The proceeding upon somewhat conceived in writing, doth for the most part facilitate dispatch: for though it should be wholly rejected, yet that negative is more pregnant of direction than an indefinite; as ashes are more generative than dust.

27 Of Seeming Wise

It hath been an opinion, that the French are wiser than they seem; and the Spaniards seem wiser than they are. But howsoever it be between nations, certainly it is so between man and man. For as the apostle saith of godliness; Having a show of godliness, but denying the power thereof; so certainly, there are in points of wisdom, and sufficiency, that do nothing or little, very solemnly; *magno conatu nugas*.^[1] It is a ridiculous thing, and fit for a satire, to persons of judgement, to see what shifts these formalists have, and what prospectives, to make superficies to seem body, that hath depth and bulk. Some are so close and reserved, as they will not show their wares, but by a dark light: and seem always to keep back somewhat: and when they know within themselves, they speak of that they do not well know, would nevertheless seem to others, to know of that which they may not well speak. Some help themselves with countenance, and gesture, and are wise by signs; as Cicero saith of Piso, that when he answered him, he fetched one of his brows up to his forehead, and bent the other down to his chin: *respondes, ahero ad fronton sublato, altero ad mention depresso supercilio, cnudelitatem tibi non placere*.^[2] Some think to bear it, by speaking a great word, and being peremptory; and go on, and take by admittance that which they cannot make good. Some, whatsoever is beyond their recall, will seem to despise or make light of it, as impertinent, or curious; and so would have their ignorance seem judgement. Some are never without a difference, and commonly by amusing men with a subtlety, blanch the matter; of whom A. Gellius saith; *hominem delirum, qui verborum minutiis rerum frangit pondera*.^[3] Of which kind also, Plato in his Protagoras bringeth in Prodicus, in scorn, and maketh him make a speech, that consisteth of distinctions from the beginning to the end. Generally, such men in all deliberations find ease to be of the negative side, and affect a credit, to object and foretell difficulties: for when

propositions are denied, there is an end of them; but if they be allowed, it requireth a new work: which false point of wisdom is the bane of business. To conclude, there is no decaying merchant, or inward beggar, hath so many tricks, to uphold the credit of their wealth, as these empty persons have, to maintain the credit of their sufficiency. Seeming wise men may make shift to get opinion: but let no man choose them for employment; for certainly, you were better take for business a man somewhat absurd than over formal.

约翰·洛克（1632—1704），英国哲学家。培根的好友。

[1] [produce] trifles with great effort

[2] You reply—with one eyebrow lifted to your forehead and the other drawn down to your chin—that you are no lover of cruelty.

[3] A madman, who wrecks weighty realities on mere verbal subtleties.

28 Of Friendship

It had been hard for him that spake it, to have put more truth and untruth together in few words, than in that speech; Whosoever is delighted in solitude, is either a wild beast, or a god. For it is most true, that a natural and secret hatred, and aversion towards society, in any man, hath somewhat of the savage beast; but it is most untrue, that it should have any character at all of the divine nature; except it proceed, not out of a pleasure in solitude, but out of a love and desire to sequester a man's self, or a higher conversation: such as is found, to have been falsely and feignedly, in some of the heathen; as Epimenides the Candian, Numa the Roman, Empedocles the Sicilian, and Apollonius of Tyana; and truly and really, in divers of the ancient hermits, and holy fathers of the Church. But little do men perceive, what solitude is, and how far it extendeth. For a crowd is not company; and faces are but a gallery of pictures; and talk but a tinkling cymbal, where there is no love. The Latin adage meeteth with it a little; *magna civitas, magna solitudo*;^[1] because in a great town, friends are scattered; so that there is not that fellowship, for the most part, which is in less neighbourhoods. But we may go further, and affirm most truly; that it is a mean and miserable solitude, to want true friends; without which the world is but a wilderness: and even in this sense also of solitude, whosoever in the frame of his nature and affections is unfit for friendship, he taketh it of the beast, and not from humanity.

A principal fruit of friendship is the ease and discharge of the fullness and swellings of the heart, which passions of all kinds do cause and induce. We know diseases of stoppings, and suffocations, are the most dangerous in the body; and it is not much otherwise in the mind: you may take sarza to open the liver; steel to open the spleen; flower of sulphur for the lungs; castoreum for the brain; but no

receipt openeth the heart, but a true friend, to whom you may impart griefs, joys, fears, hopes, suspicions, counsels, and whatsoever lieth upon the heart, to oppress it, in a kind of civil shrift or confession.

It is a strange thing to observe how high a rate great kings and monarchs do set upon this fruit of friendship, whereof we spoke: so great, as they purchase it, many times, at the hazard of their own safety, and greatness. For princes, in regard of the distance of their fortune from that of their subjects and servants, cannot gather this fruit, except (to make themselves capable thereof) they raise some persons, to be as it were companions, and almost equals to themselves, which many times sorteth to inconvenience. The modern languages give unto such persons, the name of favourites, or privadoes; as if it were matter of grace, or conversation. But the Roman name attaineth the true use, and cause thereof; naming them *participes curarum*,^[2] for it is that which tieth the knot. And we see plainly that this hath been done, not by weak and passionate princes only, but by the wisest, and most politic that ever reigned; who have oftentimes joined to themselves some of their servants; whom both themselves have called friends, and allowed others likewise to call them in the same manner, using the word which is received between private men.

L. Sulla, when he commanded Rome, raised Pompey (after surnamed the Great) to that height, that Pompey vaunted himself for Sulla's overmatch. For when he had carried the consulship for a friend of his, against the pursuit of Sulla, and that Sulla did a little resent thereat, and began to speak great, Pompey turned upon him again, and in effect bade him be quiet; For that more men adored the sun rising, than the sun setting. With Julius Caesar, Decimus Brutus had obtained that interest, as he set him down in his testament, for heir in remainder, after his nephew. And this was the man, that had power with him to draw him forth to his death. For when Caesar would have

discharged the senate, in regard of some ill presages, and especially a dream of Calpurnia; this man lifted him gently by the arm, out of his chair, telling him, he hoped he would not dismiss the senate, till his wife had dreamt a better dream. And it seemeth, his favour was so great, as Antonius in a letter which is recited verbatim, in one of Cicero's *Philippics*, calleth him *venefica*, witch; as if he had enchanted Caesar. Augustus raised Agrippa (though of mean birth) to that height, as when he consulted with Maecenas about the marriage of his daughter Julia, Maecenas took the liberty to tell him, that he must either marry his daughter to Agrippa, or take away his life; there was no third way, he had made him so great. With Tiberius Caesar, Seianus had ascended to that height, as they two were termed and reckoned, as a pair of friends. Tiberius in a letter to him saith; *haecpro amicitia nostra non occultavi*:^[3] and the whole senate dedicated an altar to friendship, as to a goddess, in respect of the great deamess of friendship between them two. The like or more was between Septimius Severus, and Plautianus. For he forced his eldest son to marry the daughter of Plaudinus; and would often maintain Plautianus, in doing affronts to his son: and did write also in a letter to the senate, by these words; I love the man so well, as I wish he may over-live me. Now if these princes had been as a Trajan, or a Marcus Aurelius, a man might have thought, that this had proceeded of an abundant goodness of nature; but being men so wise, of such strength and severity of mind, and so extreme lovers of themselves, as all these were; it proveth most plainly, that they found their own felicity (though as great as ever happened to mortal men) but as an half piece, except they mought have a friend to make it entire: and yet, which is more, they were princes that had wives, sons, nephews; and yet all these could not supply the comfort of friendship.

It is not to be forgotten, what Commineus observeth of his first master Duke Charles the Hardy; namely, that he would communicate his secrets with none; and least of all, those secrets, which troubled

him most. Whereupon he goeth on, and saith, that towards his latter time that closeness did impair and a little perish his understanding. Surely Commineus mought have made the same judgement also, if it had pleased him, of his second master Lewis the Eleventh, whose closeness was indeed his tormentor. The parable of Pythagoras is dark, but true; *cor ne edito*; eat not the heart. Certainly, if a man would give it a hard phrase. Those that want friends to open themselves unto, are cannibals of their own hearts. But one thing is most admirable (wherewith I will conclude this first fruit of friendship), which is that this communicating of a man's self to his friend works two contrary effects; for it redoubleth joys, and cutteth griefs in halves. For there is no man, that imparteth his joys to his friend, but he joyeth the more; and no man, that imparteth his griefs to his friend, but he grieveth the less. So that it is, in truth of operation upon a man's mind, of like virtue, as the alchemists use to attribute to their stone, for man's body; that it worketh all contrary effects, but still to the good and benefit of nature. But yet, without praying in aid of alchemists, there is a manifest image of this, in the ordinary course of nature. For in bodies, union strengtheneth and cherisheth any natural action; and, on the other side, weakeneth and dulleth any violent impression: and even so is it of minds.

The second fruit of friendship is healthful and sovereign for the understanding as the first is for the affections. For friendship maketh indeed a fair day in the affections from storm and tempests: but it maketh daylight in the understanding, out of darkness and confusion of thoughts. Neither is this to be understood, only of faithful counsel, which a man receiveth from his friend; but before you come to that, certain it is, that whosoever hath his mind fraught with many thoughts, his wits and understanding do clarify and break up, in the communicating and discoursing with another: he tosseth his thoughts more easily; he marshalled them more orderly; he seeth how they look when they are turned into words; finally, he waxeth wiser than

himself; and that more by an hour's discourse, then by a day's meditation. It was well said by Themistocles to the king of Persia; that speech was like cloth of Arras, opened, and put abroad; whereby the imagery doth appear in figure; whereas in thoughts they lie but as in packs. Neither is this second fruit of friendship, in opening the understanding, restrained only to such friends as are able to give a man counsel: (they indeed are best) but even, without that, a man learneth of himself, and bringeth his own thoughts to light, and whetteth his wits as against a stone, which itself cuts not. In a word, a man were better relate himself to a statue, or picture, then to suffer his thoughts to pass in smother.

Add now, to make this second fruit of friendship complete, that other point, which lieth more open, and falleth within vulgar observation; which is faithful counsel from a friend. Heraclitus saith well, in one of his enigmas; dry light is ever the best. And certain it is, that the light that a man receiveth by counsel from another, is drier, and purer, than that which cometh from his own understanding, and judgement; which is ever infused and drenched in his affections and customs. So as, there is as much difference, between the counsel that a friend giveth and that a man giveth himself, as there is between the counsel of a friend and of a flatterer. For there is no such flatterer as is a man's self, and there is no such remedy against flattery of a man's self, as the liberty of a friend. Counsel is of two sorts; the one concerning manners, the other concerning business. For the first; the best preservative to keep the mind in health, is the faithful admonition of a friend. The calling of a man's self to a strict account, is a medicine, sometime, too piercing and corrosive. Reading good books of morality is a lime flat, and dead. Observing our faults in others is sometimes improper for our case. But the best receipt (best, I say, to work, and best to take) is the admonition of a friend. It is a strange thing to behold, what gross errors, and extreme absurdities, many (especially of the greater sort) do commit, for want of a friend, to tell

them of them; to the great damage, both of their fame, and fortune. For, as St James saith, they are as men, that look sometimes into a glass, and presently forget their own shape, and favour. As for business, a man may think, if he will, that two eyes see no more than one; or that a gamester seeth always more than a looker on; or that a man in anger is as wise as he, that hath said over the four and twenty letters; or that a musket may be shot off, as well upon the arm, as upon a rest; and such other fond and high imaginations, to think himself all in all. But when all is done, the help of good counsel is that which setteth business straight. And if any man think that he will take counsel, but it shall be by pieces; asking counsel in one business of one man, and in another business of another man; it is well (that is to say, better perhaps than if he asked none at all); but he runneth two dangers: one, that he shall not be faithfully counselled; for it is a rare thing, except it be from a perfect and entire friend, to have counsel given, but such as shall be bowed and crooked to some ends, which he hath that giveth it. The other, that he shall have counsel given, hurtful, and unsafe (though with good meaning), and mixed, partly of mischief, and partly of remedy: even as if you would call a physician, that is thought good, for the cure of the disease you complain of, but is unacquainted with your body; and therefore, may put you in way for a present cure, but overthroweth your health in some other kind; and so cure the disease, and kill the patient. But a friend that is wholly acquainted with a man's estate, will beware by furthering any present business, how he dasheth upon other inconvenience. And therefore, rest not upon scattered counsel; they will rather distract, and mislead, than settle, and direct.

After these two noble fruits of frendship (peace in the affections and support of the judgement) followeth the last fruit; which is like the pomegranate full of many kernels; I mean aid and bearing a part in all actions and occasions. Here, the best way to represent to life the manifold use of frendship is to cast and see, how many things there

are, which a man cannot do himself; and then it will appear, that it was a sparing speech of the ancients, to say that a friend is another himself: for that a friend is far more than himself. Men have their time, and die many times in desire of some things, which they principally take to heart; the bestowing of a child, the finishing of a work, or the like. If a man have a true friend, he may rest almost secure, that the care of those things will continue after him. So that a man hath as it were two lives in his desires. A man hath a body, and that body is confined to a place; but where friendship is, all offices of life are as it were granted to him, and his deputy. For he may exercise them by his friend. How many things are there, which a man cannot, with any face or comeliness, say or do himself? A man can scarce allege his own merits with modesty, much less extol them: a man cannot sometimes brook to supplicate or beg: and a number of the like. But all these things, are graceful in a friend's mouth, which are blushing in a man's own. So again, a man's person hath many proper relations, which he cannot put off. A man cannot speak to his son, but as a father, to his wife, but as a husband; to his enemy, but upon terms: whereas a friend may speak, as the case requires, and not as it sorteth with the person. But to enumerate these things were endless: I have given the rule, where a man cannot fitly play his own part: if he have not a friend, he may quit the stage.

伯萊公爵，弗朗西斯的姨夫。培根自法国归来曾向其求官未果，使得培根最终专攻法律。

[1] A great city is a great solitude.

[2] associates in their cares

[3] These things out of regard for our friendship I have not concealed.

29 Of Expense

Riches are for spending; and spending for honour and good actions. Therefore extraordinary expense must be limited by the worth of the occasion: for voluntary undoing may be as well for a man's country as for the kingdom of heaven. But ordinary expense ought to be limited by a man's estate; and governed with such regard, as it be within his compass; and not subject to deceit and abuse of servants; and ordered to the best show, that the bills may be less than the estimation abroad. Certainly, if a man will keep but of even hand, his ordinary expenses ought to be but to the half of his receipts; and if he think to wax rich, but to the third part. It is no baseness, for the greatest, to descend and look into their own estate. Some forbear it, not upon negligence alone, but doubting to bring themselves into melancholy, in respect they shall find it broken. But wounds cannot be cured without searching. He that cannot look into his own estate at all, had need both choose well, those whom he employeth, and change them often: for new are more timorous, and less subtle. He that can look into his estate but seldom, it behoveth him to turn all to certainties. A man had need, if he be plentiful in some kind of expense, to be as saving again, in some other. As if he be plentiful in diet, to be saving in apparel: if he be plentiful in the hall, to be saving in the stable: and the like. For he that is plentiful in expenses of all kinds, will hardly be preserved from decay. In clearing of a man's estate, he may as well hurt himself in being too sudden, as in letting it run on too long. For hasty selling is commonly as disadvantageable as interest. Besides, he that clears at once, will relapse; for finding himself out of straits, he will revert to his customs: but he that cleareth by degrees, induceth a habit of frugality, and gained as well upon his mind, as upon his estate. Certainly, who hath a state to repair, may not despise small things: and commonly, it is less dishonourable to abridge petty charges than to stoop to petty gettings.

A man ought warily to begin charges, which once begun will continue:
but in matters that return not, he may be more magnificent.

30 Of the True Greatness of Kingdoms & Estates

The speech of Themistocles the Athenian, which was haughty and arrogant, in taking so much to himself, had been a grave and wise observation and censure, applied at large to others. Desired at a feast to touch a lute, he said; He could not fiddle, but yet he could make a small town, a great city. These words (holpen a little with a metaphor) may express two differing abilities, in those that deal in business of estate. For if a true survey be taken, of counsellors and statesmen, there may be found (though rarely) those which can make a small state great and yet cannot fiddle: as on the other side, there will be found a great many, that can fiddle very cunningly, but yet are so far from being able to make a small state great as their gift lieth the other way; to bring a great and flourishing estate to ruin and decay. And certainly, those degenerate arts and shifts, whereby many counsellor and governors gain both favour with their masters, and estimation with the vulgar, deserve no better name than fiddling; being things rather pleasing for the time, and graceful to themselves only, than tending to the weal and advancement of the state which they serve. There are also (no doubt) counsellor and governors, which may be held sufficient (*negotiis pares*^[1]), able to manage affairs, and to keep them from precipices and manifest inconveniences; which nevertheless, are far from the ability to raise and amplify an estate, in power, means, and fortune. But be the workmen what they may be, let us speak of the work; that is, the true greatness of kingdoms and estates; and the means thereof. An argument, fit for great and mighty princes to have in their hand; to the end, that neither by over-measuring their forces, they lose themselves in vain enterprises; nor on the other side, by undervaluing them, they descend to fearful and pusillanimous counsels.

The greatness of an estate in bulk and territory doth fall under measure; and the greatness of finances and revenue doth fall under computation. The population may appear by musters: and the number and greatness of cities and towns, by cards and maps. But yet there is not anything amongst civil affairs more subject to error, than the right valuation, and true judgement, concerning the power and forces of an estate. The kingdom of Heaven is compared, not to any great kernel or nut, but to a grain of mustard-seed; which is one of the least grains, but hath in it a property and spirit, hastily to get up and spread. So are there states, great in territory, and yet not apt to enlarge, or command; and some, that have but a small dimension of stem, and yet apt to be the foundations of great monarchies.

Walled towns, stored arsenals and armouries, goodly races of horse, chariots of war, elephants, ordnance, artillery, and the like: all this is but a sheep in a lion's skin, except the breed and disposition of the people be stout and warlike. Nay, number (itself) in armies, importeth not much, where the people is of weak courage: for (as Virgil saith) It never troubles a wolf how many the sheep be. The army of the Persians in the plains of Arbela was such a vast sea of people, as it did somewhat astonish the commanders in Alexander's army; who came to him therefore, and wished him to set upon them by night; but he answered, he would not pilfer the victory. And the defeat was easy. When Tigranes the Armenian, being encamped upon a hill, with four hundred thousand men, discovered the army of the Romans being not above fourteen thousand marching towards him, he made himself merry with it, and said; Yonder men are too many for an ambassage and too few for a fight. But before the sun set, he found them enough to give him the chase, with infinite slaughter. Many are the examples, of the great odds between number and courage: so that a man may truly make a judgement, that the principal point of greatness in any state is to have a race of military men. Neither is money the sinews of war (as it is trivially said), where the sinews of

men's arms, in base and effeminate people, are failing. For Solon said well to Croesus (when in ostentation he showed him his gold), Sir, if any other come that hath better iron than you he will be master of all this gold. Therefore let any prince or state think soberly of his forces, except his militia of natives be of good and valiant soldiers. And let princes, on the other side, that have subjects of martial disposition, know their own strength; unless they be otherwise wanting unto themselves. As for mercenary forces (which is the help in this case), all examples show; that, whatsoever estate or prince doth rest upon them, he may spread his feathers for a time but he will mew them soon after.

The blessing of Judah and Issachar will never meet; that the same people or nation, should be both the lion's whelp and the ass between burthens: neither will it be, that a people over-laid with taxes should ever become valiant, and martial. It is true, that taxes levied by consent of the estate, do abate men's courage less; as it hath been seen notably, in the excises of the Low Countries; and in some degree, in the subsidies of England. For you must note, that we speak now of the heart, and not of the purse. So that, although the same tribute and tax laid by consent, or by imposing, be all one to the purse, yet it works diversely upon the courage. So that you may conclude; that no people over-charged with tribute is fit for empire.

Let states that aim at greatness, take heed how their nobility and gentlemen do multiply too fast. For that maketh the common subject grow to be a peasant, and base swain, driven out of heart, and in effect but the gentleman's labourer. Even as you may see in coppice woods; if you leave your staddles too thick, you shall never have clean underwood, but shrubs and bushes. So in countries, if the gentlemen be too many, the commons will be base; and you will bring it to that, that not the hundred poll will be fit for an helmet: especially as to the infantry, which is the nerve of an army: and so there will be great

population, and little strength. This, which I speak of, hath been nowhere better seen, then by comparing of England and France; whereof England, though far less in territory and population, hath been (nevertheless) an overmatch; in regard, the middle people of England make good soldiers, which the peasants of France do not. And herein, the device of King Henry the Seventh, (whereof I have spoken largely in the history of his life) was profound, and admirable; in making farms, and houses of husbandry, of a standard; that is, maintained with such a proportion of land unto them, as may breed a subject to live in convenient plenty, and no servile condition; and to keep the plough in the hands of the owners, and not mere hirelings. And thus indeed, you shall attain to Virgil's character, which he gives to ancient Italy:

terra potens armis atque ubere glebae.^[2]

Neither is that state (which for anything I know, is almost peculiar to England and hardly to be found anywhere else, except it be perhaps in Poland) to be passed over; I mean the state of free servants and attendants upon noblemen and gentlemen; which are no ways inferior unto the yeomanry for arms. And therefore, out of all question, the splendour, and magnificence, and great retinues, and hospitality of noblemen and gentlemen received into custom, doth much conduce unto martial greatness. Whereas, contrariwise, the close and reserved living of noblemen and gentlemen causeth a penury of military forces.

By all means, it is to be procured, that the trunk of Nebuchadnezzar's tree of monarchy be great enough to bear the branches, and the boughs; that is, that the natural subjects of the crown or state bear a sufficient proportion to the stronger subjects that they govern. Therefore all states, that are liberal of naturalisation towards strangers, are fit for empire. For to think that a handful of people can, with the greatest courage and policy in the world,

embrace too large extent of dominion, it may hold for a time, but it will fail suddenly. The Spartans were a nice people, in point of naturalisation; whereby, while they kept their compass, they stood firm; but when they did spread, and their boughs were becoming too great for their stem, they became a windfall upon the sudden. Never any state was, in this point, so open to receive strangers into their body, as were the Romans. Therefore it sorted with them accordingly; for they grew to the greatest monarchy. Their manner was, to grant naturalisation (which they called *ius civitatis*^[3]), and to grant it in the highest degree; that is, not only *ins conmercci*, *ius connubii*, *ius hereditatis*; but also, *ius suffragii*, and *ius honorum*. And this, not to singular persons alone, but likewise to whole families; yea to cities, and sometimes to nations. Add to this, their custom of plantation of colonies; whereby the Roman plant was removed into the soil of other nations. And putting both constitutions together, you will say, that it was not the Roman that spread upon the world; but it was the world that spread upon the Romans: and that was the sure way of greatness. I have marvelled sometimes at Spain, how they clasp and contain so large dominions, with so few natural Spaniards: but sure, the whole compass of Spain is a very great body of a tree; far above Rome and Sparta at the first. And besides, though they have not had that usage, to naturalise liberally; yet they have that, which is next to it; that is, to employ almost indifferently all nations in their militia of ordinary soldiers: yea, and sometimes in their highest commands. Nay, it seemeth at this instant, they are sensible of this want of natives; as by the Pragmatical Sanction, now published, appeareth.

It is certain, that sedentary and within-door arts, and delicate manufactures (that require rather the finger than the arm) have, in their nature, a contrariety to a military disposition. And generally, all warlike people are a little idle; and love danger better than travail: neither must they be too much broken of it, if they shall be preserved in vigour. Therefore, it was great advantage, in the ancient states of

Sparta, Athens, Rome and others, that they had the use of slaves which commonly did rid those manufactures. But that is abolished, in greatest part, by the Christian law. That which cometh nearest to it, is to leave those arts chiefly to strangers (which for that purpose are the more easily to be received), and to contain the principal bulk of the vulgar natives, within those three kinds; tillers of the ground; free servants; and handy-craftsmen of strong and manly arts, as smiths, masons, carpenters, etc.; not reckoning professed soldiers.

But above all, for empire and greatness, it importeth most; that a nation do profess arms, as their principal honour, study, and occupation. For the things, which we formerly have spoken of, are but habitations towards arms: and what is habilitation without intention and act. Romulus, after his death (as they report, or feign) sent a present to the Romans; that, above all, they should intend arms; and then, they should prove the greatest empire of the world. The fabric of the state of Sparta was wholly (though not wisely) framed, and composed, to that scope and end. The Persians and Macedonians had it for a flash. The Gauls, Germans, Goths, Saxons, Normans and others, had it for a time. The Turks have it, at this day, though in great declination. Of Christian Europe, they that have it, are, in effect, only the Spaniards. But it is so plain, that every man profiteth in that he most intendeth, that it needeth not to be stood upon. It is enough to point at it; that no nation, which doth not directly profess arms, may look to have greatness fall into their mouths. And, on the other side, it is a most certain oracle of time; that those states, that continue long in that profession (as the Romans and Turks principally have done) do wonders. And those that have professed arms but for an age, have notwithstanding commonly attained that greatness in that age, which maintained them long after, when their profession and exercise of arms hath grown to decay.

Incident to this point is; for a state, to have those laws or customs,

which may reach forth unto them just occasions (as may be pretended) of war. For there is that justice imprinted in the nature of men, that they enter not upon wars (whereof so many calamities do ensue) but upon some, at the least specious, grounds and quarrels. The Turk hath at hand, for cause of war, the propagation of his law or sect; a quarrel that he may always command. The Romans, though they esteemed the extending the limits of their empire to be great honour to their generals, when it was done, yet they never rested upon that alone, to begin a war. First therefore, let nations, that pretend to greatness, have this; that they be sensible of wrongs, either upon borderers, merchants, or politic ministers; and that they sit not too long upon a provocation. Secondly, let them be pressed and ready to give aids and succours, to their confederates: as it ever was with the Roman: in so much, as if the confederate had leagues defensive with divers other states, and upon invasion offered, did implore their aids severally, yet the Romans would ever be the foremost, and leave it to none other to have the honour. As for the wars which were anciently made on the behalf of a kind of party, or tacit conformity of estate, I do not see how they may be well justified: as when the Romans made a war for the liberty of Greece: or when the Lacedaemonians and Athenians made wars, to set up or pull down democracies, and oligarchies: or when wars were made by foreigners, under the pretence of justice, or protection, to deliver the subjects of others from tyranny, and oppression; and the like. Let it suffice, that no estate expect to be great that is not awake, upon any just occasion of arming.

No body can be healthful without exercise, neither natural body, nor politic: and certainly, to a kingdom or estate, a just and honourable war is the true exercise. A civil war, indeed, is like the heat of a fever, but a foreign war is like the heat of exercise, and serveth to keep the body in health: for in a slothful peace, both courages will effeminate, and manners corrupt. But howsoever it be for happiness, without all question, for greatness it maketh to be still,

for the most part, in arms: and the strength of a veteran army (though it be a chargeable business), always on foot, is that, which commonly giveth the law, or at least the reputation amongst all neighbour states; as may well be seen in Spain; which hath had, in one part or other, a veteran army, almost continually, now by the space of six-score years.

To be master of the sea is an abridgement of a monarchy. Cicero writing to Atticus, of Pompey his preparation against Caesar, saith; *consilium Pompeii plane Themistocleum est; putat enim, qui mari potitur, eumrerum potiri.* ^[4] And, without doubt, Pompey had tired out Caesar, if upon vain confidence, he had not left that way. We see the great effects of battles by sea. The battle of Actium decided the empire of the world. The battle of Lepanto arrested the greatness of the Turks. There be many examples, where sea-fights have been final to the war; but this is, when princes or states have set up their rest upon the battles. But thus much is certain; that he that commands the sea is at great liberty, and may take as much, and as little of the war, as he will. Whereas those that be strongest by land, are many times nevertheless in great straits. Surely, at this day, with us of Europe, the vantage of strength at sea (which is one of the principal dowries of this kingdom of Great Britain) is great: both because, most of the kingdoms of Europe are not merely inland, but girt with the sea, most part of their compass; and because, the wealth of both Indies seems in great part but an accessory to the command of the seas.

The wars of latter ages seem to be made in the dark, in respect of the glory and honour, which reflected upon men, from the wars in ancient time. There be now, for martial encouragement, some degrees and orders of chivalry; which nevertheless, are conferred promiscuously upon soldiers and no soldiers; and some remembrance perhaps upon the scutcheon; and some hospitals for maimed soldiers; and such like things. But in ancient times; the trophies erected upon the place of the victory; the funeral laudatives and monuments for

those that died in the wars; the crowns and garlands personal; the style of emperor, which the great kings of the world after borrowed; the triumphs of the generals upon their return; the great donatives and largesses upon the disbanding of the armies; were things able to inflame all men's courage. But above all, that of the triumph, amongst the Romans, was not pageants or gaudery, but one of the wisest and noblest institutions that ever was. For it contained three things; honour to the general; riches to the treasury out of the spoils; and donatives to the army. But that honour, perhaps, were not fit for monarchies; except it be in the person of the monarch himself, or his sons; as it came to pass, in the times of the Roman emperors, who did appropriate the actual triumphs to themselves, and their sons, for such wars as they did achieve in person: and left only, for wars achieved by subjects, some triumphal garments, and ensigns, to the general.

To conclude; no man can, by care taking (as the scripture saith) add a cubit to his stature, in this little model of man's body: but in the great frame of kingdoms, and commonwealths, it is in the power of princes, or estates, to add amplitude and greatness to their kingdoms. For by introducing such ordinances, constitutions, and customs, as we have now touched, they may sow greatness to their posterity, and succession. But these things are commonly not observed, but left to take their chance.

[1] (men who are) equal to conducting affairs

[2] a land mighty in arms and in fertility of soil

[3] The right of citizenship; *ius conuerti*, etc.: the right of trading, of marriage, of inheritance, of voting, of holding public office.

[4] Pompey follows a truly Themistoclean policy: he thinks that he who commands the sea, commands all.

31 Of Regiment of Health

There is a wisdom in this, beyond the rules of physic: a man's own observation, what he finds good of, and what he finds hurt of, is the best physic to preserve health. But it is a safer conclusion to say; this agreeth not well with me, therefore I will not continue it; than this; I find no offence of this, therefore I may use it. For strength of nature in youth passeth over many excesses, which are owing a man till his age. Discern of the coming on of years, and think not, to do the same things still; for age will not be defied. Beware of sudden change in any great point of diet, and if necessity enforce it, fit the rest to it. For it is a secret, both in nature, and state; that it is safer to change many things, than one. Examine thy customs, of diet, sleep, exercise, apparel, and the like; and try in anything thou shall judge hurtful, to discontinue it by little and little; but so, as if thou doest find any inconvenience by the change, thou come back to it again: for it is hard to distinguish, that which is generally held good, and wholesome, from that, which is good particularly, and fit for thine own body. To be free minded, and cheerfully disposed, at hours of meat, and of sleep, and of exercise, is one of the best precepts of long lasting. As for the passions and studies of the mind; avoid envy; anxious fears; anger fretting inwards; subtle and knotty inquisitions; joys, and exhilarations in excess; sadness not communicated. Entertain hopes; mirth rather than joy; variety of delights, rather than surfeit of them; wonder, and admiration, and therefore novelties; studies that fill the mind with splendid and illustrious objects, as histories, fables, and contemplations of nature. If you fly physic in health altogether, it will be too strange for your body, when you shall need it. If you make it too familiar, it will work no extraordinary effect, when sickness cometh. I commend rather some diet, for certain seasons, than frequent use of physic, except it be grown into a custom. For those diets alter the body more, and trouble it less. Despise no new accident

in your body, but ask opinion of it. In sickness, respect health principally; and in health, action. For those that put their bodies to endure in health, may in most sickness, which are not very sharp, be cured only with diet, and tendering. Celsus could never have spoken it as a physician, had he not been a wise man withal, when he giveth it, for one of the great precepts of health and lasting, that a man do vary, and interchange contraries; but with an inclination to the more benign extreme: use fasting, and full eating, but rather full eating; watching and sleep, but rather sleep; sitting, and exercise, but rather exercise; and the like. So shall nature be cherished, and yet taught masteries. Physicians are some of them so pleasing, and conformable to the humour of the patient, as they press not the true cure of the disease; and some other are so regular, in proceeding according to art, for the disease, as they respect not sufficiently the condition of the patient. Take one of a middle temper, or if it may not be found in one man, combine two of either sort: and forget not to call, as well the best acquainted with your body, as the best reputed of for his faculty.

32 Of Suspicion

Suspitions amongst thoughts, are like bats amongst birds, they ever fly by twilight Certainly, they are to be repressed, or, at the least, well guarded: for they cloud the mind; they lose friends; and they check with business, whereby business cannot go on currently, and constantly. They dispose kings to tyranny, husbands to jealousy, wise men to irresolution and melancholy. They are defects, not in the heart, but in the brain; for they take place in the stoutest natures: as in the example of Henry the Seventh of England: there was not a more suspicious man, nor a more stout. And in such a composition, they do small hurt. For commonly they are not admitted, but with examination, whether they be likely or no. But in fearful natures, they gain ground too fast. There is nothing makes a man suspect much, more than to know little: and therefore men should remedy suspicion, by procuring to know more, and not to keep their suspicions in smother. What would men have? Do they think, those they employ and deal with are saints? Do they not think, they will have their own ends, and be truer to themselves than to them? Therefore, there is no better way to moderate suspicions, than to account upon such suspicions as true, and yet to bridle them as false. For so far a man ought to make use of suspicions, as to provide, as if that should be true that he suspects, yet it may do him no hurt. Suspitions, that the mind of itself gathers, are but buzzes; but suspicions, that are artificially nourished, and put into men's heads, by the tales, and whisperings of others, have stings. Certainly, the best mean to clear the way in this same wood of suspicions, is frankly to communicate them with the party that he suspects: for thereby, he shall be sure to know more of the truth of them, than he did before; and withal, shall make that party more circumspect, not to give further cause of suspicion. But this would not be done to men of base natures: for they, if they find themselves once suspected, will never be true. The Italian

says: *sospetto licentia fede*:^[1] as if suspicion did give a passport to faith: but it ought rather to kindle it, to discharge itself.

^[1] Suspicion gives faith [i.e. fidelity] leave to depart [i.e. releases it from all obligation].

33 Of Discourse

Some in their discourse, desire rather commendation of wit, in being able to hold all arguments, than of judgment, in discerning what is true: as if it were a praise, to know what might be said, and not what should be thought. Some have certain common places, and themes, wherein they are good, and want variety: which kind of poverty is for the most part tedious, and when it is once perceived ridiculous. The honourablest part of talk is to give the occasion; and again to moderate and pass to somewhat else; for then a man leads the dance. It is good in discourse and speech of conversation, to vary, and intermingle speech of the present occasion with arguments; tales with reasons; asking of questions, with telling of opinions; and jest with earnest: for it is a dull thing to tire, and, as we say now, to jade, anything too far. As for jest, there be certain things, which ought to be privileged from it; namely religion, matters of state, great persons, any man's present business of importance, and any case that deserveth pity. Yet there be some, that think their wits have been asleep, except they dart out somewhat that is piquant, and to the quick: that is a vein which would be bridled;

parce, puer, stimulis, et fortius utere loris.^[1]

And generally, men ought to find the difference, between saltness and bitterness. Certainly, he that hath a satirical vein, as he maketh others afraid of his wit, so he had need be afraid of others' memory. He that questioneth much, shall learn much, and content much; but especially, if he apply his questions to the skill of the persons whom he asketh: for he shall give them occasion, to please themselves in speaking, and himself shall continually gather knowledge. But let his questions not be troublesome; for that is fit for a poser. And let him be sure, to leave other men their turns to speak. Nay, if there be any, that

would reign, and take up all the time, let him find means to take them off, and to bring others on; as musicians use to do, with those that dance too long galliards. If you dissemble sometimes your knowledge, of that you are thought to know; you shall be thought another time, to know that, you know not. Speech of a man's self ought to be seldom, and well chosen. I knew one, was wont to say, in scorn; He must needs be a wise man, he speaks so much of himself: and there is but one case, wherein a man may commend himself, with good grace; and that is in commending virtue in another; especially, if it be such a virtue, whereunto himself pretendeth. Speech of touch towards others should be sparingly used: for discourse ought to be as a field, without coming home to any man. I knew two noblemen, of the west part of England; whereof the one was given to scoff, but kept ever royal cheer in his house: the other would ask of those, that had been at the other's table; Tell truly, was there never a flout or dry blow given; to which the guest would answer. Such and such a thing passed: the lord would say; I thought he would mar a good dinner. Discretion of speech is more than eloquence; and to speak agreeably to him, with whom we deal. is more than to speak in good words, or in good order. A good continued speech, without a good speech of interlocution, shows slowness: and a good reply, or second speech, without a good settled speech, showeth shallowness and weakness. As we see in beasts, that those that are weakest in the course, are yet nimblest in the turn: as it is betwixt the greyhound and the hare. To use too many circumstances, ere one come to the matter, is wearisome; to use none at all, is blunt.

[1] Boy, spare the goad, and pull harder at the reins.

34 Of Plantations

Plantations are amongst ancient, primitive, and heroical works. When the world was young, it begat more children; but now it is old, it begets fewer: for I may justly account new plantations, to be the children of former kingdoms. I like a plantation in a pure soil; that is, where people are not displanted, to the end to plant in others. For else, it is rather an extirpation, then a plantation. Planting of countries, is like planting of woods; for you must make account, to lose almost twenty years' profit, and expect your recompense in the end. For the principal thing, that hath been the destruction of most plantations, hath been the base and hasty drawing of profit, in the first years. It is true, speedy profit is not to be neglected, as far as may stand with the good of the plantation, but no further. It is a shameful and unblessed thing, to take the scum of people, and wicked condemned men, to be the people with whom you plant: and not only so, but it spoileth the plantation; for they will ever live like rogues, and not fall to work, but be lazy, and do mischief, and spend victuals, and be quickly weary, and then certify over to their country, to the discredit of the plantation. The people wherewith you plant, ought to be gardeners, ploughmen, labourers, smiths, carpenters, joiners, fishermen, fowlers, with some few apothecaries, surgeons, cooks, and bakers. In a country of plantation, first look about, what kind of victual the country yields of itself, to hand: as chestnuts, walnuts, pineapples, olives, dates, plums, cherries, wild honey, and the like: and make use of them. Then consider, what victual or esculent things there are, which grow speedily, and within the year, as parsnips, carrots, turnips, onions, radish, artichokes of Jerusalem, maize and the like. For wheat, barley and oats, they ask too much labour: but with peas and beans, you may begin; both because they ask less labour, and because they serve for meat, as well as for bread. And of rice likewise cometh a great increase, and it is a kind of meat. Above all, there

ought to be brought store of biscuit, oat-meal, flower, meal, and the like, in the beginning, till bread may be had. For beasts, or birds, take chiefly such as are least subject to diseases, and multiply fastest: as swine, goats, cocks, hens, turkeys, geese, house-doves, and the like. The victual in plantations ought to be expended, almost as in a besieged town; that is, with certain allowance. And let the main part of the ground employed to gardens or corn, be to a common stock; and to be laid in, and stored up, and then delivered out in proportion; besides some spots of ground, that any particular person will manure, for his own private. Consider likewise, what commodities the soil, where the plantation is, doth naturally yield, that they may some way help to defray the charge of the plantation: so it be not, as was said, to the untimely prejudice of the main business; as it hath fared with tobacco in Virginia. Wood commonly aboundeth but too much; and therefore, timber is fit to be one. If there be iron ore, and streams whereupon to set the mills; iron is a brave commodity, where wood aboundeth. Making a bay salt, if the climate be proper for it, would be put in experience. Growing silk likewise, if any be, is a likely commodity. Pitch and tar, where store of firs and pines are, will not fail. So drugs, and sweet woods, where they are, cannot but yield great profit. Soap ashes likewise, and other things that may be thought of. But moil not too much under ground: for the hope of mines is very uncertain, and useth to make the planters lazy in other things. For government let it be in the hands of one, assisted with some counsel: and let them have commission to exercise martial laws, with some limitation. And above all, let men make that profit of being in the wilderness, as they have God always, and his service before their eyes. Let not the government of the plantation depend upon too many counsellors, and undertakers, in the country that planteth, but upon a temperate number, and let those be rather noblemen, and gentlemen, than merchants: for they look ever to the present gain. Let there be freedoms from custom, till the plantation be of strength: and not only freedom from custom, but freedom to carry their commodities, where

they may make their best of them, except there be some special cause of caution. Cram not in people, by sending too fast company after company; but rather hearken how they waste, and send supplies proportionably; but so, as the number may live well in the plantation, and not by surcharge be in penury. It hath been a great endangering to the health of some plantations, that they have built along the sea, and rivers, in marsh and unwholesome grounds.

Therefore, though you begin there, to avoid carriage, and other like discommodities, yet build still rather upwards, from the streams, than along. It concerneth likewise the health of the plantation, that they have good store of salt with them, that they may use it in their victuals, when it shall be necessary. If you plant, where savages are, do not only entertain them with trifles, and gingles; but use them justly, and graciously, with sufficient guard nevertheless: and do not win their favour, by helping them to invade their enemies, but for their defence it is not amiss: and send oft of them, over to the country that plants, that they may see a better condition then their own, and commend it when they return. When the plantation grows to strength, then it is time to plant with women, as well as with men; that the plantation may spread into generations, and not be ever pieced from without. It is the sinfulllest thing in the world, to forsake or destitute a plantation, once in forwardness: for besides the dishonour, it is the guiltiness of blood of many commiserable persons.

35 Of Riches

I cannot call riches better than the baggage of virtue. The Roman word is better, *impedimenta*. For as the baggage is to an army, so is riches to virtue. It cannot be spared, nor left behind, but it hindreth the march; yea, and the care of it, sometimes, loseth or disturbeth the victory: of great riches, there is no real use, except it be in the distribution; the rest is but conceit. So saith Solomon; Where much is, there are many to consume it; and what hath the owner, but the sight of it with his eyes? The personal fruition in any man, cannot reach to feel great riches: there is a custody of them; or a power of dole and donative of them; or a fame of them; but no solid use to the owner. Do you not see, what feigned prices are set upon little stones, and rarities? And what works of ostentation are undertaken, because there might seem to be some use of great riches? But then you will say, they may be of use, to buy men out of dangers or troubles. As Solomon saith; Riches are as a strong hold, in the imagination of the rich man. But this is excellently expressed, that it is in imagination, and not always in fact. For certainly great riches have sold more men, than they have bought out. Seek not proud riches, but such as thou mayest get justly, use soberly, distribute cheerfully, and leave contentedly. Yet have no abstract nor friarly contempt of them. But distinguish, as Cicero saith well of Rabirius Postumus; *in studio rei amplificandae apparebat non avaritiae praedam, in studio rei amplificandae apparebat non avaritiae praedam, sed instrumentum bonitati, quaeri.*^[1] Harken also to Solomon, and beware of hasty gathering of riches: *qui festinat ad divitias, non erit insons*^[2] The poets feign that when Plutus (which is riches) is sent from Jupiter, he limps, and goes slowly; but when he is sent from Pluto, he runs, and is swift of foot. Meaning, that riches gotten by good means, and just labour, pace slowly; but when they come by the death of others (as by the course of inheritance, testaments, and the like), they come tumbling upon a man. But it

mought be applied likewise to Pluto, taking him for the devil. For when riches come from the devil (as by fraud, and oppression, and unjust means), they come upon speed. The ways to enrich are many, and most of them foul. Parsimony is one of the best, and yet is not innocent: for it withholdeth men from works of liberality, and charity. The improvement of the ground, is me most natural obtaining of riches; for it is our great mother's blessing, the earth's; but it is slow. And yet, where men of great wealth do stoop to husbandry, it muldplieth riches exceedingly. I knew a nobleman in England, that had the greatest audits of any man in my time: a great grazier, a great sheep-master, a great timber man, a great collier, a great corn-master, a great lead-man, and so of iron, and a number of the like points of husbandry. So as the earth seemed a sea to him, in respect of the perpetual importation. It was truly observed by one, that himself came very hardly to a little riches, and very easily to great riches. For when a man's stock is come to that, that he can expect the prime of markets, and overcome those bargains, which for their greatness are few men's money, and be partner in the industries of younger men, he cannot but increase mainly. The gains of ordinary trades and vocations are honest; and furthered by two things, chiefly: by diligence; and by a good name, for good and fair dealing. But the gains of bargains are of a more doubtful nature; when men shall wait upon others' necessity, broke by servants and instruments to draw them on, put off others cunningly that would be better chapmen, and the like practices, which are crafty and naught. As for the chopping of bargains, when a man buys not to hold, but to sell over again, that commonly grindeth double, both upon the seller and upon the buyer. Sharings do greatly enrich, if the hands be well chosen, that are trusted. Usury is the certainest means of gain, though one of the worst; as that, whereby a man doth eat his bread; *in sudore vultus alieni*^[3]: and besides, doth plough upon Sundays. But yet, certain though it be, it hath flaws; for that the scriveners and brokers do value unsound men, to serve their own turn. The fortune, in being the first in an invention, or in a

privilege, doth cause sometimes a wonderful overgrowth in riches; as it was with the first sugar man, in the Canaries: therefore, if a man can play the true logician, to have as well judgement as invention, he may do great matters; especially if the times be fit. He that resteth upon gains certain, shall hardly grow to great riches: and he that puts all upon adventures, doth often times break, and come to poverty: it is good therefore, to guard adventures with certainties, that may uphold losses. Monopolies, and coemption of wares for resale, where they are not restrained, are great means to enrich; especially if the party have intelligence what things are like to come into request, and so store himself beforehand. Riches gotten by service, though it be of the best rise, yet when they are gotten by flattery, feeding humours, and other servile conditions, they may be placed amongst the worst. As for fishing for testaments and executorships (as Tacitus saith of Seneca; *testamenta et orbos, tanquam indagine capi*^[41]) it is yet worse; by how much men submit themselves to meaner persons than in service. Believe not much them, that seem to despise riches: for they despise them, that despair of them; and none worse, when they come to them. Be not penny-wise; riches have wings, and sometimes they fly away of themselves, sometimes they must be set flying to bring in more. Men leave their riches, either to their kindred; or to the public: and moderate portions prosper best in both. A great state left to an heir, is as a lure to all the birds of prey round about, to seize on him, if he be not the better established in years and judgement. Likewise glorious gifts and foundations are like sacrifices without salt; and but the painted sepulchres of alms, which soon will putrefy, and corrupt inwardly. Therefore, measure not thine advancements by quantity, but frame them by measure; and defer not charities till death: for certainly, if a man weigh it rightly, he that doth so, is rather liberal of another man's, than of his own.

[1] In his pursuit of wealth it was plain that he sought, not food for avarice, but an instrument of doing good.

[2] He that maketh haste to be rich shall not be innocent (Proverbs xxviii: 20).

[3] in the sweat of another's face

[4] Childless men and their bequests were caught by him as in a net.

36 Of Prophecies

I mean not to speak of divine prophecies; nor of heathen oracles; nor of natural predictions; but only of prophecies, that have been of certain memory, and from hidden causes. Saith the Pythonissa to Saul; Tomorrow thou and thy son shall be with me Homer hath these verses:

*at domus Aeneae cunctis dominabitur oris,
et nati natorum, et qui nascentur ab illis:*^[1]

a prophecy, as it seems, of the Roman Empire. Seneca the tragedian hath these verses:

*venient annis
secula seris, quibus Oceanus
vincula rerum laxet, et ingens
pateat tellus, Tiphysque novos
detegat orbes; nec sit terris
ultima Thule:*^[2]

a prophecy of the discovery of America. The daughter of Polycrates dreamed that Jupiter bathed her father, and Apollo anointed him: and it came to pass, that he was crucified in an open place, where the sun made his body run with sweat, and the rain washed it. Philip of Macedon dreamed, he sealed up his wife's belly: whereby he did expound it, that his wife should be barren: but Aristander the soothsayer told him, his wife was with child, because men do not use to seal vessels that are empty. A phantasm that appeared to M. Brutus in his tent said to him; *Philippis iterum me videbis.*^[3] Tiberius said to Galba: *tu quoque, Galba, degustabis imperium.*^[4] In Vespasian's time, there went a prophecy in the East; that those that should come forth of Judea, should reign over the world: which

though it may be was meant of our saviour, yet Tacitus expounds it of Vespasian. Domidan dreamed, the night before he was slain, that a golden head was growing out of the nape of his neck: and indeed, the succession that followed him, for many years, made golden times. Henry the Sixth of England, said of Henry the Seventh, when he was a lad, and gave him water. This is the lad, that shall enjoy the crown, for which we strive. When I was in France, I heard from one Dr Pena, that the Queen Mother, who was given to curious arts, caused the King her husband's nativity to be calculated under a false name; and the astrologer gave a judgement, that he should be killed in a duel; at which the Queen laughed, thinking her husband to be above challenges and duels: but he was slain, upon a course at tilt, the splinters of the staff of Montgomery going in at his beaver. The trivial prophecy, which I heard, when I was a child, and Queen Elizabeth was in the flower of her years, was;

When hempe is spun,
England's done.

Whereby, it was generally conceived, that after the princes had reigned, which had the principal letters of that word hempe (which were Henry, Edward, Mary, Philip, and Elizabeth), England should come to utter confusion: which, thanks be to God, is verified only in the change of the name: for that the King's style is now no more of England, but of Britain. There was also another prophecy, before the year of 1688, which I do not well understand:

There shall be seen upon a day,
Between the baugh, and the may,
The black fleet of Norway.
When that that is come and gone,
England build houses of lime and stone.
For after wars shall you have none.

It was generally conceived, to be meant of the Spanish fleet, that came in 1688. For that the King of Spain's surname, as they say, is Norway. The prediction of Regiomontanus;

octogesimus octavus marabilis annus;^[5]

was thought likewise accomplished, in the sending of that great fleet, being the greatest in strength, though not in number, of all that ever swam upon the sea. As for Cleon's dream, I think it was a jest. It was, that he was devoured of a long dragon; and it was expounded of a maker of sausages, that troubled him exceedingly. There are numbers of the like kind; especially if you include dreams, and predictions of astrology. But I have set down these few only of certain credit, for example. My judgement is, that they ought all to be despised; and ought to serve, but for winter talk by the fireside. Though when I say despised, I mean it as for belief: for otherwise, the spreading or publishing of them is in no sort to be despised. For they have done much mischief: and I see many severe laws made to suppress them. That, that hath given them grace, and some credit, consisteth in three things. First, that men mark, when they hit, and never mark, when they miss: as they do, generally, also of dreams. The second is, that probable conjectures, or obscure traditions, many times turn themselves into prophecies: while the nature of man, which coveteth divination, thinks it no peril to foretell that, which indeed they do but collect. As that of Seneca's verse. For so much was then subject to demonstration, that the globe of the earth had great parts beyond the Atlantic; which mought be probably conceived, not to be all sea: and adding thereto the tradition in Plato's *Timaeus*, and his *Atlanticus*, it mought encourage one, to turn it to a prediction. The third, and last (which is the great one) is, that almost all of them, being infinite in number, have been impostures, and by idle and crafty brains, merely contrived and feigned, after the event past.

[1] But the house of Aeneas shall rule over all the coasts—his children's children, and those that shall be born of them.

[2] In later ages there shall come a time, when Ocean shall loose the bands of nature, and a vast continent shall lie open, and Tiphys shall disclose new worlds, and Thule shall no longer be the end of the earth.

[3] Thou shalt see me again at Philippi.

[4] Thou also, Galba, shalt taste of empire.

[5] eighty-eight, a year of wonders.

37 Of Ambition

Ambition is like choler; which is an humour, that maketh men active, earnest, full of alacrity, and stirring, if it be not stopped. But if it be stopped, and cannot have his way, it becometh adust, and thereby malign and venomous. So ambitious men, if they find the way open for their rising, and still get forward, they are rather busy than dangerous; but if they be checked in their desires, they become secretly discontent, and look upon men and matters, with an evil eye; and are best pleased, when things go backward; which is the worst property, in a servant of a prince or state. Therefore it is good for princes, if they use ambitious men, to handle it so, as they be still progressive, and not retrograde: which because it cannot be without inconvenience, it is good not to use such natures at all. For if they rise not with their service, they will take order to make their service fall with them. But since we have said, it were good not to use men of ambitious natures, except it be upon necessity, it is fit we speak in what cases they are of necessity. Good commanders in the wars must be taken, be they never so ambitious: for me use of their service dispenseth with the rest; and to take a soldier without ambition, is to pull off his spurs. There is also great use of ambitious men, in being screens to princes, in matters of danger and envy: for no man will take that part, except he be like a seeled dove, that mounts and mounts, because he cannot see about him. There is use also of ambitious men, in pulling down the greatness of any subject that overtops: as Tiberius used Macro in the pulling down of Seianus. Since therefore they must be used, in such cases, there resteth to speak how they are to be bridled, that they may be less dangerous. There is less danger of them, if they be of mean birth, than if they be noble: and if they be rather harsh of nature, than gracious and popular: and if they be rather new raised, than grown cunning, and fortified in their greatness. It is counted by some a weakness in princes, to have favourites: but it is, of

all others, the best remedy against ambitious great-ones. For when the way of pleasuring and displeasuring lieth by the favourite, it is impossible any other should be over-great. Another means to curb them, is to balance them by others as proud as they. But then, there must be some middle counsellors, to keep things steady: for without that ballast, the ship will roll too much. At the least, a prince may animate and inure some meaner persons, to be, as it were, scourges to ambitious men. As for the having of them obnoxious to ruin, if they be of fearful natures, it may do well: but if they be stout, and daring, it may precipitate their designs, and prove dangerous. As for the pulling of them down, if the affairs require it, and that it may not be done with safety suddenly, the only way is the interchange continually of favours, and disgraces; whereby they may not know what to expect; and be, as it were, in a wood. Of ambitions, it is less harmful, the ambition to prevail in great things, than that other, to appear in everything; for that breeds confusion, and mars business. But yet, it is less danger to have an ambitious man stirring in business, than great in dependencies. He that seeketh to be eminent amongst able men, hath a great task; but that is ever good for the public. But he that plots to be the only figure amongst ciphers, is the decay of an whole age. Honour hath three things in it: the vantage ground to do good: the approach to kings, and principal persons: and the raising of a man's own fortunes. He that hath the best of these intentions, when he aspireth, is an honest man: and that prince that can discern of these intentions in another that aspireth, is a wise prince. Generally, let princes and states choose such ministers, as are more sensible of duty, than of rising; and such as love business rather upon conscience, than upon bravery: and let them discern a busy nature, from a willing mind.

38 Of Masques & Triumphs

These things are but toys, to come amongst such serious observations. But yet, since princes will have such things, it is better they should be graced with elegancy, than daubed with cost. Dancing to song, is a thing of great state, and pleasure. I understand it, that the song be in choir, placed aloft, and accompanied with some broken music; and the ditty fitted to the device. Acting in song, especially in dialogues, hath an extreme good grace: I say acting, not dancing (for that is a mean and vulgar thing), and the voices of the dialogue would be strong and manly (a bass, and a tenor; no treble) and the ditty high and tragical; not nice or dainty. Several choirs, placed one over against another, and taking the voice by catches, anthem-wise, give great pleasure. Turning dances into figure is a childish curiosity. And generally, let it be noted, that those things which I here set down, are such as do naturally take the sense, and not respect petty wonderments. It is true, the alterations of scenes, so it be quietly, and without noise, are things of great beauty, and pleasure: for they feed and relieve the eye, before it be full of the same object. Let the scenes abound with light, specially coloured and varied: and let the masquers, or any other, that are to come down from the scene, have some motions upon the scene itself, before their coming down: for it draws the eye strangely, and makes it with great pleasure, to desire to see that it cannot perfectly discern. Let the songs be loud, and cheerful, and not chirpings, or pulings. Let the music likewise be sharp, and loud, and well placed. The colours that show best by candlelight are; white, carnation, and a kind of seawater-green; and oes, or spangs, as they are of no great cost, so they are of most glory. As for rich embroidery, it is lost, and not discerned. Let the suits of the masquers be graceful, and such as become the person, when the vizors are off: not after examples of known attires; Turks, soldiers, mariners, and the like. Let antimasques not be long; they have been commonly of fools,

satyrs, baboons, wild-men, antics, beasts, sprites, witches, Ethiopes, pigmies, turquets, nymphs, rustics, cupids, statues moving, and the like. As for angels, it is not comical enough, to put them in anti-masques; and any thing that is hideous, as devils, giants, is on the other side as unfit. But chiefly, let the music of them be recreative, and with some strange changes. Some sweet odours, suddenly coming forth, without any drops falling, are, in such a company, as there is steam and heat, things of great pleasure and refreshment. Double masques, one of men, another of ladies, addeth state and variety. But all is nothing, except the room be kept clear and neat.

For justs, and tourneys, and barriers; the glories of them are chiefly in the chariots, wherein the challengers make their entry; especially if they be drawn with strange beasts; as lions, bears, camels, and the like: or in the devices of their entrance; or in the bravery of their liveries; or in the goodly furniture of their horses, and armour. But enough of these toys.

39 Of Nature in Men

Nature is often hidden; sometimes overcome; seldom extinguished. Force maketh nature more violent in me return: doctrine and discourse maketh nature less importune: but custom only doth alter and subdue nature. He that seeketh victory over his nature, let him not set himself too great, nor too small tasks: for the first will make him dejected by often failings; and the second will make him a small proceeder, though by often prevailings. And at the first, let him practise with helps, as swimmers do with bladders, or rushes: but after a time, let him practise with disadvantages, as dancers do with thick shoes. For it breeds great perfection, if the practice be harder than the use. Where nature is mighty, and therefore the victory hard, the degrees had need be; first to stay and arrest nature in time; like to him, that would say over the four and twenty letters, when he was angry: then to go less in quantity; as if one should, in forbearing wine, come from drinking healths, to a draught at a meal: and lastly, to discontinue altogether. But if a man have the fortitude, and resolution, to enfranchise himself at once, that is the best;

*optimus ille animi vindex, laedentia pectus
vincula qui rupit, dedoluitque semel.*^[1]

Neither is the ancient rule amiss, to bend nature as a wand, to a contrary extreme, whereby to set it right: understanding it, where the contrary extreme is no vice. Let not a man force a habit upon himself, with perpetual continuance, but with some intermission. For both the pause reinforceth the new onset; and if a man that is not perfect be ever in practice, he shall as well practise his errors, as his abilities; and induce one habit of both: and there is no means to help this, but by seasonable intermissions. But let not a man trust his victory over his nature too far, for nature will lay buried a great time, and yet

revive, upon the occasion or temptation. Like as it was with Aesop's damsel, turned from a cat to a woman; who sat very demurely, at the board's end, till a mouse ran before her. Therefore let a man either avoid the occasion altogether, or put himself often to it, that he may be little moved with it. A man's nature is best perceived in privateness, for there is no affectation; in passion, for that putteth a man out of his precepts; and in a new case or experiment, for there custom leaveth him. They are happy men, whose natures sort with their vocations; otherwise they may say, *multum incola fuit anima mea*,^[2] when they converse in those things, they do not affect. In studies, whatsoever a man commandeth upon himself, let him set hours for it: but whatsoever is agreeable to his nature, let him take no care for any set times: for his thoughts will fly to it of themselves; so as the spaces of other business, or studies, will suffice. A man's nature runs either to herbs, or weeds; therefore let him seasonably water the one, and destroy the other.

[1] He best asserts the soul's freedom, who snaps the fetters that gall his breast, and ceases once for all to suffer.

[2] My soul hath been a long sojourner (Psalms cxx: 6).

40 Of Custom & Education

Men's thoughts are much according to their inclination: their discourse and speeches according to their learning, and infused opinions; but their deeds are after as they have been accustomed. And therefore, as Machiavelli well noteth (though in an evil favoured instance) there is no trusting to the force of nature, nor to the bravery of words; except it be corroborate by custom. His instance is, that for the achieving of a desperate conspiracy, a man should not rest upon the fierceness of any man's nature, or his resolute undertakings; but take such an one, as hath had his hands formerly in blood. But Machiavelli knew not of a Friar Clement, nor a Ravillac, nor a Jaureguy, nor a Baltazar Gerard: yet his rule holdeth still, that nature, nor the engagement of words, are not so forcible as custom. Only superstition is now so well advanced, that men of the first blood are as firm as butchers by occupation: and votary resolution is made equipollent to custom, even in matter of blood. In other things, the predominancy of custom is everywhere visible; in so much, as a man would wonder, to hear men profess, protest, engage, give great words, and then do just as they have done before: as if they were dead images, and engines moved only by the wheels of custom. We see also the reign or tyranny of custom, what it is. The Indians (I mean the sect of their wise men) lay themselves quietly upon a stack of wood, and so sacrifice themselves by fire. Nay, the wives strive to be burned with the corpses of their husbands. The lads of Sparta, of ancient time, were wont to be scourged upon the altar of Diana, without so much as queening. I remember in the beginning of Queen Elizabeth's time of England, an Irish rebel condemned, put up a petition to the deputy, that he might be hanged in a with, and not in an halter, because it had been so used, with former rebels. There be monks in Russia, for penance, that will sit a whole night in a vessel of water, till they be engaged with hard ice. Many examples may be put of the force of

custom, both upon mind, and body. Therefore, since custom is the principal magistrate of man's life, let men by all means endeavour to obtain good customs. Certainly, custom is most perfect, when it beginneth in young years: this we call education; which is, in effect, but an early custom. So we see, in languages the tongue is more pliant to all expressions and sounds, the joints are more supple to all fears of activity and motions, in youth than afterwards. For it is true, that late learners cannot so well take the ply; except it be in some minds, that have not suffered themselves to fix, but have kept themselves open and prepared to receive continual amendment, which is exceeding rare. But if the force of custom simple and separate, be great: the force of custom copulate, and conjoined and collegiate, is far greater. For there example teacheth; company comforteth; emulation quickeneth; glory raiseth: so as in such places the force of custom is in his exaltation. Certainly, the great multiplication of virtues upon human nature resteth upon societies well ordained, and disciplined. For commonwealths, and good governments, do nourish virtue grown, but do not much mend the seeds. But the misery is, that the most effectual means are now applied to the ends least to be desired.

41 Of Fortune

It cannot be denied, but outward accidents conduce much to fortune, favour, opportunity, death of others, occasion fitting virtue. But chiefly, the mould of a man's fortune is in his own hands. *Faber quisque fortunae suae*;^[1] saith the poet. And the most frequent of external causes is, that the folly of one man is the fortune of another. For no man prospers so suddenly, as by others' errors. *Serpens nisi serpentem comederit non fit draco*.^[2] Overt and apparent virtues bring forth praise; but there be secret and hidden virtues, that bring forth fortune; certain deliveries of a man's self, which have no name. The Spanish name, *desemboltura*,^[3] partly expresseth them: when there be not stonds, nor restiveness in a man's nature; but that the wheels of his mind keep way with the wheels of his fortune. For so Livy (after he had described Cato Major, in these words; *in illo viro, tantum robur corporis et animi fuit, ut quocunque loco natus esset, fortunam sibi facturum videretur*)^[4] falleth upon that, that he had *versatile ingenium*.^[5] Therefore, if a man look sharply, and attentively, he shall see fortune: for though she be blind, yet she is not invisible. The way of fortune is like the Milken Way in the sky; which is a meeting or knot of a number of small stars; not seen asunder, but giving light together. So are there a number of little, and scarce discerned virtues, or rather faculties and customs, that make men fortunate. The Italians note some of them, such as a man would little think. When they speak of one that cannot do amiss, they will throw in, into his other conditions, that he hath *poco di matto*.^[6] And certainly, there be not two more fortunate properties; than to have a little of the fool; and not too much of the honest. Therefore, extreme lovers of their country, or masters, were never fortunate, neither can they be. For when a man placeth his thoughts without himself, he goeth not his own way. An hasty fortune maketh an enterpriser, and remover (the French hath it better, *entrepreneur*, or *remuant*), but the exercised fortune maketh the able

man. Fortune is to be honoured, and respected, and it be but for her daughters, Confidence, and Reputation. For those two felicity breedeth: the first within a man's self; the latter, in others towards him. All wise men, to decline me envy of their own virtues, use to ascribe them to providence and fortune; for so they may the better assume them: and besides, it is greatness in a man, to be the care of me higher powers. So Caesar said to me pilot in the tempest, *Caesarem portas, et fortunam eius*.^[7] So Sulla chose the name of Felix, and not of Magnus. And it hath been noted, that those that ascribe openly too much to their own wisdom, and policy, end unfortunate. It is written, that Timotheus the Athenian, after he had, in the account he gave to the state of his government, often interlaced this speech, 'and in this fortune had no part', never prospered in anything he undertook afterwards. Certainly, there be, whose fortunes are like Homer's verses, that have a slide, and easiness, more than the verses of other poets: as Plutarch saith of Timoleon's fortune, in respect of that of Agesilaus, or Epaminondas. And that this should be, no doubt it is much in a man's self.

[1] Every man is the architect of his own fortune.

[2] A serpent unless it has eaten a serpent does not become a dragon.

[3] 'dexterity, readiness' (so defined in Richard Percyvall's *Bibliotheca Hispanica*, 1591); adroitness which finds an easy and graceful outlet on all occasions for what it is in a man to do or say.

[4] There was in him such strength of body and mind that in whatever rank he had been born, he would have been likely to win fortune for himself.

[5] versatility

[6] a little of the fool or madman

[7] You carry Caesar and his fortune.

42 Of Usury

Many have made witty invectives against usury. They say, that it is pity, the devil should have God's part, which is the tithe. That the usurer is the greatest Sabbath breaker, because his plough goeth every Sunday. That the userer is the drone, that Virgil speaketh of:

ignavum fucos pecus a praesepibus arcent.^[1]

That the usurer breaketh the first law that was made for mankind, after the fall; which was, *in sudore vultus tui comedes panem tuum*;^[2] not, *in sudore vultus alieni*.^[3] That usurers should have orange-tawny bonnets, because they do Judaize. That it is against nature, for money to beget money; and the like. I say this only, that usury is a *concessum propter duritiem cordis*,^[4] for since there must be borrowing and lending, and men are so hard of heart as they will not lend freely, usury must be permitted. Some others have made suspicious and cunning propositions of banks, discovery of men's estates, and other inventions. But few have spoken of usury usefully. It is good to set before us the incommoides, and commodities of usury; that the good may be either weighed out, or culled out; and warily to provide, that while we make forth to that which is better, we meet not with that which is worse.

The discommodities of usury are: first, that it makes fewer merchants. For were it not for this lazy trade of usury, money would not lie still, but would, in great part, be employed upon merchandising; which is the *vena porta*^[5] of wealth in a state. The second, that it makes poor merchants. For as a farmer cannot husband his ground so well, if he sit at a great rent; so the merchant cannot drive his trade so well, if he sit at great usury. The third is incident to the other two; and that is, the decay of customs of kings or states, which ebb or flow with merchandising. The fourth, that it bringeth the

treasure of a realm or state into a few hands. For the usurer being at certainties, and others at uncertainties, at the end of the game; most of the money will be in the box; and ever a state flourisheth, when wealth is more equally spread. The fifth, that it beats down the price of land: for the employment of money is chiefly, either merchandising, or purchasing; and usury waylays both. The sixth, that it doth dull and damp all industries, improvements, and new inventions, wherein money would be stirring, if it were not for this slug. The last, that it is the cancer and ruin of many men's estates; which in process of time breeds a public poverty.

On the other side, the commodities of usury are, first, that howsoever usury in some respect hindereth merchandising, yet in some other it advanceth it: for it is certain, that the greatest part of trade is driven by young merchants, upon borrowing at interest: so as if the usurer either call in, or keep back his money, there will ensue presently a great stand of trade. The second is, that were it not for this easy borrowing upon interest, men's necessities would draw upon them a most sudden undoing; in that they would be forced to sell their means (be it lands or goods) far under foot; and so, whereas duty doth but gnaw upon them, bad markets would swallow them quite up. As for mortgaging, or pawning, it will lime mend the matter, for either men will not take pawns without use; or if they do, they will look precisely for the forfeiture. I remember a cruel moneyed man, in the country, that would say; the devil take this usury, it keeps us from forfeitures of mortgages and bonds. The third and last is; that it is a vanity to conceive that there would be ordinary borrowing without profit; and it is impossible to conceive the number of inconveniencies that will ensue, if borrowing be cramped. Therefore, to speak of the abolishing of usury is idle. All states have ever had it, in one kind or rate, or other. So as that opinion must be sent to Utopia.

To speak now, of the reformation and reiglement of usury; how

the discommodities of it may be best avoided, and the commodities retained. It appears by the balance of commodities and discommodities of usury, two things are to be reconciled. The one, that the tooth of usury be grinded, that it bite not too much: the other, that there be left open a means, to invite moneyed men to lend to the merchants, for the continuing and quickening of trade. This cannot be done, except you introduce several sorts of usury; a less, and a greater. For if you reduce usury to one low rate, it will ease the common borrower, but the merchant will be to seek for money. And it is to be noted that the trade of merchandise, being the most lucrative, may bear usury at a good rate; other contracts not so.

To serve both intentions, the way would be briefly thus. That there be two rates of usury, the one free, and general for all; the other under licence only, to certain persons, and in certain places of merchandising. First therefore, let usury, in general, be reduced to five in the hundred; and let that rate be proclaimed to be free and current; and let the state shut itself out, to take any penalty for the same. This will preserve borrowing from any general stop or dryness. This will ease infinite borrowers in the country. This will, in good part, raise the price of land, because land purchased at sixteen years purchase will yield six in the hundred, and somewhat more, whereas this rate of interest yields but five. This, by like reason, will encourage and edge industrious and profitable improvements; because many will rather venture in that kind, than take five in the hundred, especially having been used to greater profit. Secondly, let there be certain persons licensed to lend, to known merchants, upon usury at a higher rate; and let it be with the cautions following. Let the rate be, even with the merchant himself, somewhat more easy, than that he used formerly to pay: for, by that means, all borrowers shall have some ease by this reformation, be he merchant, or whosoever. Let it be no rank or common stock, but every man be master of his own money: not that I altogether mislike banks, but they will hardly be brooked, in regard of

certain suspicions. Let the state be answered, some small matter, for the licence, and the rest left to the lender: for if the abatement be but small, it will no whit discourage the lender. For he, for example, that took before ten or nine in the hundred, will sooner descend to eight in the hundred, than give over his trade of usury, and go from certain gains, to gains of hazard. Let these licenced lenders be in number indefinite, but restrained to certain principal cities and towns of merchandising: for then they will be hardly able to colour other men's monies in the country: so as the licence of nine will not suck away the current rate of five: for no man will send his monies far off, nor put them into unknown hands.

If it be objected that this doth, in a sort, authorise usury, which before was, in some places, but permissive: the answer is, that it is better to mitigate usury by declaration, than to suffer it to rage by connivance.

[1] The drones, an idle swarm, they banish from their hives.

[2] In the sweat of the face, shalt thou eat thy bread.

[3] in the sweat of another's face

[4] a thing allowed on account of the hardness of men's hearts (cf. Matthew xix:

[5] the 'gate-vein' which distributes blood to the liver

43 Of Youth & Age

A man that is young in years, may be old in hours, if he have lost no time. But that happeneth rarely. Generally, youth is like the first cogitations, not so wise as the second. For there is a youth in thoughts as well as in ages. And yet the invention of young men is more lively than that of old: and imaginations stream into their minds better, and, as it were, more divinely. Natures that have much heat, and great and violent desires and perturbations, are not ripe for action, till they have passed the meridian of their years: as it was with Julius Caesar, and Septimius Severus. Of the latter of whom, it is said; *iuventutem egit erroribus, imo furoribus, plenam*.^[1] And yet he was the ablest emperor, almost, of all the list But reposed natures may do well in youth. As it is seen in Augustus Caesar, Cosmus Duke of Florence, Gaston de Foix, and others. On the other side, heat and vivacity in age is an excellent composition for business. Young men are fitter to invent, than to judge; fitter for execution, than for counsel; and fitter for new projects, than for settled business. For the experience of age, in things that fall within the compass of it, directeth them; but in new things, abuseth them. The errors of young men are the ruin of business; but the errors of aged men amount but to this; that more might have been done, or sooner. Young men, in the conduct and manage of actions, embrace more than they can hold, stir more than they can quiet; fly to the end, without consideration of the means, and degrees; pursue some few principles, which they have chanced upon absurdly; care not to innovate, which draws unknown inconveniences; use extreme remedies at first; and, that which doubled all errors, will not acknowledge or retract them; like an unready horse, that will neither stop, nor turn. Men of age object too much, consult too long, adventure too little, repent too soon, and seldom drive business home to the full period; but content themselves with a mediocrity of success. Certainly, it is good to compound employments of both; for that will

be good for the present, because the virtues of either age may correct the defects of both: and good for succession, that young men may be learners, while men in age are actors: and lastly, good for extreme accidents, because authority followeth old men, and favour and popularity youth. But far the moral part, perhaps youth will have the pre-eminence, as age hath for the politic. A certain rabbin, upon the text; Your young men that see visions, and your old men that dream dreams; inferreth, that young men are admitted nearer to God than old; because vision is a clearer revelation, than a dream. And certainly, the more a man drinketh of the world, the more it intoxicateth; and age doth profit rather in the powers of understanding, than in the virtues of the will and affections. There be some have an over-early ripeness in their years, which fadeth betimes: these are first, such as have brittle wits, the edge whereof is soon turned; such as was Hermogenes the Rhetorician, whose books are exceeding subtle; who afterwards waxed stupid. A second sort is of those, that have some natural dispositions, which have better grace in youth, than in age: such as is a fluent and luxuriant speech; which becomes youth well, but not age: so Tully saith of Hortentius; *idem manebat, neque idem decebat*.^[2] The third is of such as take too high a strain at the first; and are magnanimous, more than tract of years can uphold. As was Scipio Africanus, of whom Livy saith in effect; *ultima primis cedebant*.^[3]

本·琼森，著名诗人。培根的好友，参加培根60岁生日并为其赋诗。

[1] He spent a youth full of errors, nay of madnesses.

[2] He remained the same, when it was no longer becoming to him.

[3] The last of him was not equal to the first.

44 Of Beauty

Virtue is like a rich stone, best plain set: and surely virtue is best in a body that is comely, though not of delicate features: and that hath rather dignity of presence, than beauty of aspect. Neither is it almost seen, that very beautiful persons are otherwise of great virtue; as if nature were rather busy not to err, than in labour to produce excellency. And therefore, they prove accomplished, but not of great spirit; and study rather behaviour, than virtue; but this holds not always; for Augustus Caesar, Titus Vespasianus, Philip le Belle of France, Edward the Fourth of England, Alcibiades of Athens, Ismael the Sophy of Persia, were all high and great spirits; and yet the most beautiful men of their times. In beauty, that of favour is more than that of colour, and that of decent and gracious motion, more than that of favour. That is the best part of beauty, which a picture cannot express; no, nor the first sight of the life. There is no excellent beauty, that hath not some strangeness in the proportion. A man cannot tell, whether Apelles, or Albert Durer, were the more trifler: whereof the one would make a personage by geometrical proportions: the other, by taking the best parts out of divers faces, to make one excellent. Such personages, I think, would please nobody but the painter that made them. Not but I think a painter may make a better face, than ever was; but he must do it, by a kind of felicity (as a musician that maketh an excellent air in music) and not by rule. A man shall see faces, that if you examine them, part by part, you shall find never a good; and yet all together do well. If it be true, that the principal part of beauty is in decent motion, certainly it is no marvel though persons in years seem many times more amiable; *pulchrorum autumnus pulcher*: [1] for no youth can be comely but by pardon, and considering the youth as to make up the comeliness. Beauty is as summer fruits, which are easy to corrupt, and cannot last and, for the most part, it makes a dissolute youth, and an age a little out of countenance: but yet

certainly again, if it light well, it maketh virtues shine, and vices blush.

[\[1\]](#) The autumn of the beautiful is beautiful.

45 Of Deformity

Deformed persons are commonly even with nature: for as nature hath done ill by them, so do they by nature: being for the most part, (as the scripture saith) void of natural affection; and so they have their revenge of nature. Certainly there is a consent between the body and the mind; and where nature erreth in the one, she ventureth in the other. *Ubi peccat in uno, periclitatur in altero.*^[1] But because there is in man an election touching the frame of his mind, and a necessity in the frame of his body, the stars of natural inclination are sometimes obscured by the sun of discipline, and virtue. Therefore, it is good to consider of deformity, not as a sign, which is more deceivable; but as a cause, which seldom failed of the effect. Whosoever hath anything fixed in his person, that doth induce contempt, hath also a perpetual spur in himself, to rescue and deliver himself from scorn: therefore all deformed persons are extreme bold. First, as in their own defence, as being exposed to scorn; but in process of time, by a general habit. Also it stirreth in them industry, and especially of this kind, to watch and observe the weakness of others, that they may have somewhat to repay. Again, in their superiors, it quencheth jealousy towards them, as persons that they think they may at pleasure despise: and it layeth their competitors and emulators asleep; as never believing, they should be in possibility of advancement, till they see them in possession. So that, upon the matter, in a great wit, deformity is an advantage to rising. Kings in ancient times (and at this present in some countries) were wont to put great trust in eunuchs; because they that are envious towards all, are more obnoxious and officious towards one. But yet their trust towards them hath rather been as to good spials, and good whisperers; than good magistrates, and officers. And much like is the reason of deformed persons. Still the ground is, they will, if they be of spirit, seek to free themselves from scorn; which must be, either by virtue, or malice: and therefore, let it not be

marvelled, if sometimes they prove excellent persons; as was Agesilaus, Zanger the son of Solyman, Aesop, Gasca President of Peru; and Socrates may go likewise amongst them; with others.

[1] Where she errs in the one, she runs a risk in the other.

46 Of Building

Houses are built to live in, and not to look on: therefore let use be preferred before uniformity; except where both may be had. Leave the goodly fabrics of houses, for beauty only, to the enchanted palaces of the poets: who build them with small cost He that builds a fair house, upon an ill seat, committeth himself to prison. Neither do I reckon it an ill seat only where the air is unwholesome; but likewise where the air is unequal; as you shall see many fine seats, set upon a knap of ground, environed with higher hills round about it: whereby the heat of the sun is pent in, and the wind gathereth as in troubles; so as you shall have, and that suddenly, as great diversity of heat and cold, as if you dwelt in several places. Neither is it ill air only that maketh an ill seat, but ill ways, ill markets; and, if you will consult with Momus, ill neighbours. I speak not of many more: want of water, want of wood, shade, and shelter, want of fruitfulness, and mixture of grounds of several natures; want of prospect; want of level grounds; want of places, at some near distance, for sports of hunting, hawking, and races; too near the sea, too remote; having the commodity of navigable rivers, or the discommodity of their overflowing; too far off from great cities, which may hinder business; or too near them, which lurcheth all provisions, and maketh every thing dear: where a man hath a great living laid together, and where he is scant: all which, as it is impossible, perhaps, to find together, so it is good to know them, and think of them, that a man may take as many as he can: and if he have several dwellings, that he sort them so, that what he wanteth in the one, he may find in the other. Lucullus answered Pompey well; who when he saw his stately galleries, and rooms, so large and lightsome, in one of his houses, said; Surely, an excellent place for summer, but how do you in winter? Lucullus answered; Why, do you not think me as wise as some fowl are, that ever change their abode towards the winter?

To pass from the seat, to the house itself; we will do as Cicero doth, in the orator's art; who writes books *De Oratore*, and a book he entitles *Orator*: whereof the former delivers the precepts of the art; and the latter the perfection. We will therefore describe a princely palace, making a brief model thereof. For it is strange to see, now in Europe, such huge buildings as the Vatican, and Escorial, and some others be, and yet scarce a very fair room in them.

First therefore, I say, you cannot have a perfect palace, except you have two several sides; a side for me banquet, as is spoken of in the *Book of Hester*, and a side for the household: the one for feasts and triumphs, and the other for dwelling. I understand both these sides to be not only returns, but parts of the front; and to be uniform without, though severally partitioned within; and to be on both sides of a great and stately tower, in the midst of the front; that as it were, joineth them together, on either hand. I would have on the side of the banquet, in front, one only goodly room, above stairs, of some forty foot high; and under it, a room for a dressing or preparing place, at times of triumphs. On the other side, which is the household side, I wish it divided at the first into a hall, and a chapel (with a partition between); both of good state, and bigness: and those not to go all the length, but to have, at the further end, a winter and a summer parlour, both fair. And under these rooms, a fair and large cellar, sunk under ground: and likewise, some privy kitchens, with butteries, and pantries, and the like. As for the tower, I would have it two storeys, of eighteen foot high a piece, above the two wings; and a goodly leads upon the top, railed with statues interposed; and the same tower to be divided into rooms, as shall be thought fit. The stairs likewise, to the upper rooms, let them be upon a fair open newel, and finely railed in, with images of wood, cast into a brass colour: and a very fair landing place at the top. But this to be, if you do not point any of the lower rooms, for a dining place of servants. For otherwise, you shall have the servants' dinner after your own: for the steam of it will come up as

in a tunnel. And so much for the front. Only, I understand the height of the first stairs to be sixteen foot, which is the height of the lower room.

Beyond this front, is there to be a fair court, but three sides of it, of a far lower building than the front. And in all the four corners of that court, fair staircases, cast into turrets, on the outside, and not within the row of buildings themselves. But those towers are not to be of the height of the front; but rather proportionable to the lower building. Let the court not be paved, for that striketh up a great heat in summer, and much cold in winter. But only some side alleys, with a cross, and me quarters to graze, being kept shorn, but not too near shorn. The row of return, on the banquet side, let it be all stately galleries; in which galleries, let there be three or four fine cupolas, in the length of it, placed at equal distance: and fine coloured windows of several works. On the household side, chambers of presence, and ordinary entertainments, with some bed-chambers; and let all three sides be a double house, without through lights, on the sides, that you may have rooms from the sun, both for forenoon, and afternoon. Cast it also, that you may have-rooms, born for summer, and winter. shady for summer, and warm for winter. You shall have sometimes fair houses, so full of glass, that one cannot tell where to become, to be out of the sun, or cold: for inbowed windows, I hold them of good use; (in cities indeed, upright do better, in respect of the uniformity towards the street) for they be pretty retiring places for conference; and besides, they keep both the wind and sun off: for that which would strike almost through the room, doth scarce pass the window. But let them be but few, four in the court, on the sides only.

Beyond this court, let there be an inward court of the same square and height; which is to be environed, with the garden, on all sides: and in the inside, cloistered on all sides, upon decent and beautiful arches, as high as the first storey. On the under storey, towards the

garden, let it be turned to a grotto, or place of shade, or estivation. And only have opening and windows towards the garden; and be level upon the floor, no whit sunk under ground, to avoid all dampishness. And let there be a fountain, or some fair work of statues, in the midst of this court; and to be paved as the other court was. These buildings to be for privy lodgings, on both sides; and the end, for privy galleries. Whereof, you must foresee, that one of them be for an infirmary, if the prince or any special person should be sick, with chambers, bed-chamber, antecamera, and recamera, joining to it This upon the second storey. Upon the ground storey, a fair gallery, open, upon pillars: and upon the third storey likewise, an open gallery upon pillars, to take the prospect, and freshness of the garden. At both corners of the further side, by way of return, let there be two delicate or rich cabinets, daintily paved, richly hanged, glazed with crystalline glass, and a rich cupola in the midst; and all other elegancy that may be thought upon. In the upper gallery too, I wish that there may be, if the place will yield it, some fountains running, in divers places, from the wall, with some fine avoidances. And thus much, for the model of the palace: save that you must have, before you come to the front, three courts. A green court plain, with a wall about it: a second court of the same, but more garnished, with little turrets, or rather embellishments, upon the wall: and a third court, to make a square with the front, but not to be built, nor yet enclosed with a naked wall, but enclosed with terraces, leaded aloft, and fairly garnished, on the three sides; and cloistered on the inside, with pillars, and not with arches below. As for offices, let them stand at distance, with some lofty galleries, to pass from them to the palace itself.

47 Of Gardens

God Almighty first planted a garden. And indeed, it is the purest of human pleasure. It is the greatest refreshment to the spirits of man; without which buildings and palaces are but gross handy-works: and a man shall ever see, that when ages grow to civility and elegance, men come to build stately, sooner than to garden finely: as if gardening were the greater perfection. I do hold it, in the royal ordering of gardens, there ought to be gardens, for all the months in the year: in which, severally, things of beauty may be then in season. For December, and January, and the latter part of November, you must take such things as are green all winter: holly; ivy; bays; juniper, cypress trees; yew; pineapple trees; fir trees; rosemary; lavender, periwinkle, the white, the purple, and the blue; germander, flags; orange trees; lemon trees; and myrtles, if they be stoved; and sweet marjoram warm set. There followeth, for the latter part of January, and February, the mezereon tree, which then blossoms; *crocus vernus*, both the yellow, and the grey; primroses; anemones; the early tulip; *hyacinthus orientalis*; *chamairis*; *fritillaria*. For March, there come violets, specially the single blue, which are the earliest; the yellow daffodil; the daisy; the almond tree in blossom; the peach tree in blossom; the cornelian tree in blossom; sweet briar. In April follow, the double white violet; the wallflower, the stock gillyflower, the cowslip, fleur-de-lis, and lilies of [all] natures; rosemary flowers; the tulip; the double peony; the pale daffodil; the French honeysuckle; the cherry tree in blossom; the damson and plum trees in blossom; the white thorn in leaf; the lilac tree. In May and June, come pinks of all sorts, specially the blush pink; roses of all kinds, except the musk, which comes later; honeysuckles; strawberries; bugloss; columbine; the French marigold; *flos africanus*; cherry tree in fruit, *ribes*, figs in fruit; raspberries; vine flowers; lavender in flowers; the sweet satyrian, with the white flower, *herba muscaria*; *lilium convallium*; the apple tree in

blossom. In July, come gillyflowers of all varieties; musk roses; the lime tree in blossom; early pears, and plums in fruit; ginnittings; quadlins. In August, come plums of all sorts in fruit; pears; apricots; berberries; filberts; musk melons; monks-hoods, of all colours. In September, come grapes; apples; poppies of all colours; peaches; melocotones; nectarines; cornelians; wardens; quinces. In October, and the beginning of November, come services; medlars; bullises; roses cut or removed to come late; holly oaks; and such like. These particulars are for the climate of London; but my meaning is perceived, that you may have *ver perpetuum*,^[1] as the place affords.

And because me breath of flowers is far sweeter in the air (where it comes and goes, like the warbling of music) than in the hand, therefore nothing is more fit for that delight, than to know, what be the flowers, and plants that do best perfume the air. Roses, damask and red, are fast flowers of their smells; so that you may walk by a whole row of them, and find nothing of their sweetness; yea though it be in a morning's dew. Bays likewise yield no smell, as they grow. Rosemary little; nor sweet marjoram. That which above all others yields the sweetest smell in the air, is the violet; specially the white double violet, which comes twice a year, about the middle of April, and about Bartholomew-tide. Next to that is, the musk rose. Then the strawberry leaves dying, which [yield] a most excellent cordial smell. Then the flower of the vines; it is a little dust, like the dust of a bent, which grows upon the cluster, in the first coming forth. Then sweet briar. Then wallflowers, which are very delightful, to be set under a parlour, or lower chamber window. Then pinks, [and gillyflowers] specially the matted pink, and clove gillyflower. Then the flowers of the lime tree. Then the honeysuckles, so they be somewhat a far off. Of bean flowers I speak not, because they are field flowers. But those which perfume the air most delightfully, not passed by as the rest, but being trodden upon and crushed, are three: that is buret, wild thyme, and water mints. Therefore, you are to set whole alleys of them, to

have the pleasure, when you walk or tread.

For gardens, (speaking of those, which are indeed princelike, as we have done of buildings) the contents ought not well to be under thirty acres of ground; and to be divided into three parts: a green in the entrance; a heath or desert in the going forth; and the [main] garden in the midst; besides alleys, on both sides. And I like well, that four acres of ground be assigned to the green; six to the heath; four and four to either side; and twelve to the main garden. The green hath two pleasures, the one, because nothing is more pleasant to the eye, than green grass kept finely shorn; the other, because it will give you a fair alley in the midst, by which you may go in front upon a stately hedge, which is to enclose the garden. But, because the alley will be long, and in great heat of the year, or day, you ought not to buy the shade, in the garden, by going in the sun through the green, therefore you are, of either side the green, to plant a covert alley, upon carpenter's work, about twelve foot in height, by which you may go in shade into the garden. As for the making of knots, or figures, with divers coloured earths, that they may lie under the windows of the house, on that side which the garden stands, they be but toys: you may see as good sights, many times, in tarts. The garden is best to be square; encompassed, on all the four sides, with a stately arched hedge. The arches to be upon pillars, of carpenter's work, of some ten foot high, and six foot broad: and the spaces between, of the same dimension, with the breadth of the arch. Over the arches, let there be an entire hedge, of some four foot high, framed also upon carpenter's work: and upon the upper hedge, over every arch, a little turret, with a belly, enough to receive a cage of birds: and over every space, between the arches, some other lime figure, with broad plates of round coloured glass, gilt, for the sun to play upon. But this hedge I intend to be raised upon a bank, not steep, but gently slope, of some six foot, set all with flowers. Also I understand, that this square of the garden, should not be the whole breadth of the ground, but to leave,

on either side, ground enough for diversity of side alleys: unto which, the two covert alleys of the green may deliver you. But there must be no alleys with hedges, at either end, of this great enclosure: not at the hither end, for letting your prospect upon mis fair hedge from the green; nor at the further end, for letting your prospect from the hedge, through the arches, upon the heath.

For the ordering of the ground, within the great hedge, I leave it to variety of device; advising nevertheless, that whatsoever form you cast it into, first it be not too busy, or full of work. Wherein I, for my part, do not like images cut out in juniper, or other garden stuff: they be for children. Little low hedges, round, like welts, with some pretty pyramids, I like well: and in some places, fair columns upon frames of carpenter's work. I would also have the alleys spacious and fair. You may have closer alleys upon the side grounds but none in the main garden. I wish also, in the very middle, a fair mount, with three ascents, and alleys, enough for four to walk abreast; which I would have to be perfect circles, without any bulwarks, or embossment; and the whole mount, to be thirty foot high; and some fine banqueting house, with some chimneys neatly cast, and without too much glass.

For fountains, they are a great beauty, and refreshment; But pools mar all, and make the garden unwholesome, and full of flies, and frogs. Fountains I intend to be of two natures: the one, that sprinkleth or spouteth water, the other a fair receipt of water, of some thirty or forty foot square, but without fish, or slime, or mud. For the first, the ornaments of images gilt, or of marble, which are in use, do well: but the main matter is so to convey the water, as it never stay, either in the bowls, or in the cistern; that the water be never by rest discoloured, green, or red, or the like: or gather any mossiness or putrefaction. Besides that, it is to be cleansed every day by the hand. Also some steps up to it, and some fine pavement about it, doth well. As for the other kind of fountain, which we may call a bathing pool, it

may admit much curiosity, and beauty; wherewith we will not trouble ourselves: as, that the bottom be finely paved, and with images: the sides likewise; and withal embellished with coloured glass, and such things of lustre; encompassed also, with fine rails of low statues. But the main point is the same, which we mentioned, in the former kind of fountain; which is, that the water be in perpetual motion, fed by a water higher than the pool and delivered into it by fair spouts, and then discharged away under ground, by some equality of bores, that it stay little. And for fine devices, of arching water without spilling, and making it rise in several forms (of feathers, drinking glasses, canopies, and the like), they be pretty things to look on, but nothing to health and sweetness.

For the heath, which was the third part of our plot, I wish it to be framed, as much as may be, to a natural wildness. Trees I would have none in it; but some thickets, made only of sweet-briar, and honeysuckle, and some wild vine amongst; and the ground set with violets, strawberries, and primroses. For these are sweet, and prosper in the shade. And these to be in the heath, here and there, not in any order. I like also little heaps, in the nature of mole-hills (such as are in wild heaths), to be set, some with wild thyme; some with pinks; some with germander, that gives a good flower to the eye; some with periwinkles; some with violets; some with strawberries; some with cowslips; some with daisies; some with red roses; some with liliu convallium; some with sweet-williams red; some with bears-foot; and the like low flowers, being withal sweet, and sightly. Part of which heaps, to be with standards of little bushes, pricked upon their top, and part without. The standards to be roses; juniper, holly; berberries (but here and there, because of the smell of their blossom); red currants; gooseberries; rosemary; bays; sweet-briar; and such like. But these standards to be kept with cutting, that they grow not out of course.

For the side grounds, you are to fill them with variety of alleys, private, to give a full shade; some of them, wheresoever the sun be. You are to frame some of them likewise for shelter, that when the wind blows sharp, you may walk, as in a gallery. And those alleys must be likewise hedged, at both ends, to keep out the wind; and these closer alleys, must be ever finely gravelled, and no grass, because of going wet. In many of these alleys likewise, you are to set fruit trees of all sorts; as well upon the walls, as in ranges. And this would be generally observed, that the borders, wherein you plant your fruit trees, be fair and large, and low, and not steep; and set with fine flowers, but thin and sparingly, lest they deceive trees. At the end of both the side grounds, I would have a mount of some pretty height, leaving the wall of the enclosure, breast high, to look abroad into the fields.

For the main garden, I do not deny, but there should be some fair alleys, ranged on both sides, with fruit trees; and some pretty tufts of fruit trees, and arbours with seats, set in some decent order; but these to be by no means set too thick; but to leave the main garden, so as it be not close, but the air open and free. For as for shade, I would have you rest upon the alleys of the side grounds, there to walk, if you be disposed, in the heat of the year, or day; but to make account, that the main garden is for the more temperate parts of the year; and in the heat of summer, for the morning, and the evening, or over-cast days.

For aviaries, I like them not, except they be of that largeness, as they may be turfed, and have living plants, and bushes, set in them; that the birds may have more scope, and natural nesting, and that no foulness appear in the floor of the aviary. So I have made a platform of a princely garden, partly by precept, partly by drawing, not a model, but some general lines of it; and in this I have spared for no cost. But it is nothing for great princes, that for the most part, taking advice with workmen, with no less cost, set their things together, and

sometimes add statues, and such things, for state, and magnificence,
but nothing to the true pleasure of a garden.

[\[1\]](#) a perpetual Spring

48 Of Negotiating

It is generally better to deal by speech, than by letter; and by the mediation of a third, than by a man's self. Letters are good, when a man would draw an answer by letter back again; or when it may seem, for a man's justification, afterwards to produce his own letter, or where it may be danger to be interrupted, or heard by pieces. To deal in person is good, when a man's face breedeth regard, as commonly with inferiors; or in tender cases, where a man's eye, upon the countenance of him with whom he speaketh, may give him a direction, how far to go: and generally, where a man will reserve to himself liberty either to disavow, or to expound. In choice of instruments, it is better to choose men of a plainer sort, that are like to do that, that is committed to them, and to report back again faithfully the success; than those, that are cunning to contrive out of other men's business, somewhat to grace themselves; and will help the matter, in report, for satisfaction sake. Use also such persons as affect the business, wherein they are employed; for that quickeneth much; and such as are fit for the matter, as bold men for expostulation, fair spoken men for persuasion, crafty men for enquiry and observation, froward and absurd men for business that doth not well bear out itself. Use also such as have been lucky, and prevailed before in things wherein you have employed them; for that breeds confidence, and they will strive to maintain their prescription. It is better to sound a person, with whom one deals, a far off, than to fall upon the point at first; except you mean to surprise him by some short question. It is better dealing with men in appetite, than with those that are where they would be. If a man deal with another upon conditions, the start or first performance is all; which a man cannot reasonably demand, except either the nature of the thing be such, which must go before; or else a man can persuade the other party, that he shall still need him, in some other thing; or else that he be counted the honestest man. All

practice is to discover, or to work. Men discover themselves, in trust; in passion; at unawares; and of necessity, when they would have somewhat done, and cannot find an apt pretext. If you would work any man, you must either know his nature, and fashions, and so lead him; or his ends, and so persuade him; or his weakness, and disadvantages, and so awe him; or those that have interest in him, and so govern him. In dealing with cunning persons, we must ever consider their ends, to interpret their speeches; and it is good to say little to them, and that which they least look for. In all negotiations of difficulty, a man may not look to sow and reap at once; but must prepare business, and so ripen it by degrees.

49 Of Followers & Friends

Costly followers are not to be liked; lest while a man maketh his train longer, he make his wings shorter. I reckon to be costly, not them alone, which charge the purse, but which are wearisome and importune in suits. Ordinary followers ought to challenge no higher conditions, than countenance, recommendation, and protection from wrongs. Factious followers are worse to be liked, which follow not upon affection to him, with whom they range themselves, but upon discontentment conceived against some other: whereupon commonly ensueth that ill intelligence, that we many times see between great personages. Likewise glorious followers, who make themselves as trumpets, of the commendation of those they follow, are full of inconvenience; for they taint business through want of secrecy; and they export honour from a man, and make him a return in envy. There is a kind of followers likewise, which are dangerous, being indeed espials; which enquire the secrets of the house, and bear tales of them to others. Yet such men, many times, are in great favour; for they are officious, and commonly exchange tales. The following by certain estates of men, answerable to that which a great person himself professteth (as of soldiers to him that hath been employed in the wars, and the like), hath ever been a thing civil, and well taken even in monarchies; so it be without too much pomp or popularity. But the most honourable kind of following, is to be followed as one that apprehendeth, to advance virtue and desert, in all sorts of persons. And yet, where there is no eminent odds in sufficiency, it is better to take with me more passable, than with the more able. And besides, to speak truth, in base times, active men are of more use, than virtuous. It is true that in government, it is good to use men of one rank equally: for to countenance some extraordinarily, is to make them insolent, and the rest discontent; because they may claim a due. But contrariwise in favour, to use men with much difference and election,

is good; for it maketh the persons preferred more thankful, and the rest more officious; because all is of favour. It is good discretion, not to make too much of any man, at the first; because one cannot hold out that proportion. To be governed (as we call it) by one, is not safe: for it shows softness, and gives a freedom to scandal and disreputation: for those that would not censure, or speak ill of a man immediately, will talk more boldly of those that are so great with them, and thereby wound their honour. Yet to be distracted with many is worse; for it makes men to be of the last impression, and full of change. To take advice of some few friends is ever honourable; for lookers-on, many times, see more than gamesters; and the vale best discovereth the hill. There is little friendship in the world, and least of all between equals, which was wont to be magnified. That that is, is between superior and inferior, whose fortunes may comprehend, the one the other.

50 Of Suitors

Many ill matters and projects are undertaken; and private suits do putrefy the public good. Many good matters are undertaken with bad minds; I mean not only corrupt minds, but crafty minds, that intend not performance. Some embrace suits, which never mean to deal effectually in them; but if they see there may be life in the matter, by some other mean, they will be content to win a thank, or take a second reward, or at least to make use, in the mean time, of the suitor's hopes. Some take hold of suits only for an occasion, to cross some other, or to make an information, whereof they could not otherwise have apt pretext; without care what become of the suit, when that turn is served: or generally, to make other men's business a kind of entertainment, to bring in their own. Nay, some undertake suits with a full purpose, to let them fall; to the end, to gratify the adverse party, or competitor. Surely, there is, in some sort, a right in every suit: either a right of equity, if it be a suit of controversy; or a right of desert, if it be a suit of petition. If affection lead a man to favour the wrong side in justice, let him rather use his countenance to compound the matter, than to carry it. If affection lead a man to favour the less worthy in desert, let him do it without depraving or disabling the better deserver. In suits, which a man doth not well understand, it is good to refer them to some friend of trust and judgement, that may report whethe he may deal in them with honour: but let him choose well his referendaries, for else he may be led by the nose. Suitors are so distasted with delays, and abuses, that plain dealing, in denying to deal in suits at first, and reporting the success barely, and in challenging no more thanks than one hath deserved, is grown not only honourable, but also gracious. In suits of favour, the first coming ought to take little place: so far forth consideration may be had of his trust, that if intelligence of the matter could not otherwise have been had, but by him, advantage be not taken of the

note, but the party left to his other means; and, in some sort, recompensed for his discovery. To be ignorant of the value of a suit, is simplicity; as well as to be ignorant of the right thereof, is want of conscience. Secrecy in suits is a great mean of obtaining; for voicing them, to be in forwardness, may discourage some kind of suitors; but doth quicken and awake others. But timing of the suit is the principal. Timing, I say, not only in respect of the person that should grant it, but in respect of those which are like to cross it. Let a man, in the choice of his mean, rather choose the fittest mean, than the greatest mean: and rather them, that deal in certain things, than those that are general. The reparation of a denial is sometimes equal to the first grant; if a man show himself neither dejected, nor discontented. *Iniquum petas, ut aequum feras*,^[1] is a good rule, where a man haul strength of favour: but otherwise, a man were better rise in his suit; for he that would have ventured at first to have lost the suitor, will not in the conclusion lose both the suitor, and his own former favour. Nothing is thought so basic a request, to a great person, as his letter; and yet, if it be not in a good cause, it is so much out of his reputation. There are no worse instruments, than these general contrivers of suits; for they are but a kind of poison and infection to public proceedings.

[1] Ask for more than is just, in order to get what is just.

51 Of Faction

Many have an opinion not wise, that for a prince to govern his estate, or for a great person to govern his proceedings, according to the respect of factions, is a principal part of policy: whereas contrariwise, the chiefest wisdom is, either in ordering those things which are general, and wherein men of several factions do nevertheless agree; or in dealing with correspondence to particular persons, one by one. But I say not, that the consideration of factions is to be neglected. Mean men, in their rising, must adhere; but great men, that have strength in themselves, were better to maintain themselves indifferent, and neutral. Yet even in beginners, to adhere so moderately, as he be a man of the one faction, which is most passable with the other, commonly giveth best way. The lower and weaker faction is the firmer in conjunction: and it is often seen, that a few that are stiff, do tire out a greater number that are more moderate. When one of the factions is extinguished, the remaining subdivideth: as the faction, between Lucullus and the rest of the nobles of the Senate (which they called *Optimates*) held out a while, against the faction of Pompey and Caesar: but when the senate's authority was ruled down, Caesar and Pompey soon after brake. The faction or party of Antonius, and Octavianus Caesar, against Brutus and Cassius, held out likewise for a time: but when Brutus and Cassius were overthrown, then soon after Antonius and Octavianus brake and subdivided. These examples are of wars, but the same holdeth in private factions. And therefore, those that are seconds in factions do many times, when the faction subdivideth, prove principals: but many times also, they prove ciphers and cashiered: for many a man's strength is in opposition; and when that faileth, he groweth out of use. It is commonly seen, that men once placed, take in with the contrary faction to that by which they enter, thinking belike that they have the first sure; and now are ready for a new purchase. The traitor in faction

lightly goeth away with it; for when matters have stuck long in balancing, the winning of some one man casteth them, and he getteth all the thanks. The even carriage between two factions proceedeth not always of moderation, but of a trueness to a man's self, with end to make use of both. Certainly in Italy, they hold it a little suspect in Popes, when they have often in their mouth, *padre commune*:^[1] and take it to be a sign of one, that meaneth to refer all to the greatness of his own house. Kings had need beware how they side themselves, and make themselves as of a faction or party: for leagues within the state are ever pernicious to monarchies; for they raise an obligation, paramount to obligation of sovereignty, and make the king *tanquam unus ex nobis*:^[2] as was to be seen in the league of France. When factions are carried too high, and too violently, it is a sign of weakness in princes; and much to the prejudice, both of their authority, and business. The motions of factions, under kings, ought to be like the motions (as the astronomers speak) of the inferior orbs; which may have their proper motions, but yet still, are quietly carried by the higher motion of *primum mobile*.^[3]

[1] common father, father of all alike

[2] as one of us (Genesis iii: 22)

[3] 'the first moveable' or 'first moved' (Paradise Lost 3, line 483), the tenth sphere or heaven of the old astronomy, which carried round with it in its revolution the lower spheres of the planets and fixed stars.

52 Of Ceremonies & Respects

He that is only real, had need have exceeding great parts of virtue: as the stone had need to be rich, that is set without foil. But if a man mark it well, it is in praise and commendation of men as it is in gettings and gains: for the proverb is true, that light gains make heavy purses; for light gains come thick, whereas great come but now and then. So it is true, that small matters win great commendation, because they are continually in use, and in note: whereas the occasion of any great virtue cometh but on festivals. Therefore it doth much add to a man's reputation, and is (as Queen Isabella said) like perpetual letters commendatory, to have good forms. To attain them, it almost sufficeth, not to despise them: for so shall a man observe them in others: and let him trust himself with the rest. For if he labour too much to express them, he shall lose their grace; which is to be natural and unaffected. Some men's behaviour is like a verse, wherein every syllable is measured: how can a man comprehend great matters, that hreaketh his mind too much to small observations? Not to use ceremonies at all, is to teach others not to use them again; and so diminisheth respect to himself: especially they be not to be omitted to strangers, and formal natures: but the dwelling upon them, and exalting them above the moon, is not only tedious, but doth diminish the faith and credit of him that speaks. And certainly, there is a kind of conveying of effectual and imprinting passages, amongst compliments, which is of singular use, if a man can hit upon it. Amongst a man's peers, a man shall be sure of familiarity; and therefore, it is good a little to keep state. Amongst a man's inferiors, one shall be sure of reverence; and therefore it is good a little to be familiar. He that is too much in anything, so that he giveth another occasion of satiety, maketh himself cheap. To apply one's self to others is good: so it be with demonstration, that a man doth it upon regard and not upon facility. It is a good precept, generally in seconding

another, yet to add somewhat of one's own: as if you will grant his opinion, let it be with some distinction; if you will follow his motion, let it be with condition; if you allow his counsel, let it be with alleging further reason. Men had need beware, how they be too perfect in compliments; for be they never so sufficient otherwise, their enviers will be sure to give them that attribute, to the disadvantage of their greater virtues. It is loss also in business, to be too full of respects, or to be too curious in observing times and opportunities. Solomon saith; He that considereth the wind shall not sow, and he that looketh to the clouds shall not reap. A wise man will make more opportunities than he finds. Men's behaviour should be like their apparel, not too strait, or point device, but free for exercise or motion.

53 Of Praise

Praise is the reflection of virtue. But it is as the glass or body, which giveth the reflection. If it be from the common people, it is commonly false and naught: and rather followeth vain persons, than virtuous: for the common people understand not many excellent virtues: the lowest virtues draw praise from them; the middle virtues work in them astonishment, or admiration; but of the highest virtues, they have no sense or perceiving at all. But shows, and *species virtutibus similes*,^[1] serve best with them. Certainly, fame is like a river, that beareth up things light and swollen, and drowns things weighty and solid: but if persons of quality and judgement concur, then it is, (as the scripture saith) *nomen bonum instar unguenti fragrantis*.^[2] It filleth all round about, and will not easily away. For the odours of ointments are more durable, than those of flowers. There be so many false points of praise, that a man may justly hold it a suspect. Some praises proceed merely of flattery; and if he be an ordinary flatterer, he will have certain common attributes, which may serve every man; if he be a cunning flatterer, he will follow the arch-flatterer, which is a man's self; and wherein a man thinketh that of himself, therein the flatterer will uphold him most; but if he be an impudent flatterer, look wherein a man is conscious to himself that he is most defective, and is most out of countenance in himself, that will the flatterer entitle him to, perforce, *spretā conscientia*.^[3] Some praises come of good wishes, and respects, which is a form due in civility to kings, and great persons, *laudando praecipere*,^[4] when by telling men what they are, they represent to them what they should be. Some men are praised maliciously to their hurt, thereby to stir envy and jealousy towards them; *pessimum genus inimicorum landantium*;^[5] in so much as it was a proverb, amongst the Grecians; that, he that was praised to his hurt, should have a push rise upon his nose: as we say; that a blister will rise upon one's tongue, that tells a lie. Certainly moderate

praise, used with opportunity, and not vulgar, is that which doth the good. Solomon saith, he that praiseth his friend aloud, rising early, it shall be to him no better than a curse. Too much magnifying of man or matter doth irritate contradiction, and procure envy and scorn. To praise a man's self cannot be decent, except it be in rare cases: but to praise a man's office or profession, he may do it with good grace, and with a kind of magnanimity. The cardinals of Rome, which are theologues, and friars, and schoolmen, have a phrase of notable contempt and scorn towards civil business: for they call all temporal business, of wars, embassages, judicature, and other employments, *sbirrerie*, which is, under-sheriffies; as if they were but matters for under-sheriffs and catchpoles; though many times, those under-sheriffies do more good than their high speculations. St Paul, when he boasts of himself, he doth oft interlace; I speak like a fool; but speaking of his calling, he saith; *magnifico apostolatum meum*.^[6]

[1] appearances resembling virtues

[2] A good name is like a fragrant ointment. (Ecclesiastes viii: 1)

[3] in disdain of the other's consciousness [of imperfection]

[4] to instruct by praising

[5] the worst sort of enemies, those that praise you

[6] I will magnify mine office (Romans xi: 13).

54 Of Vainglory

It was prettily devised of Aesop; the fly sat upon the axle-tree of the chariot wheel, and said. What a dust do I raise? So are there some vain persons, that whatsoever goeth alone, or moveth upon greater means, if they have never so little hand in it, they think it is they that carry it. They that are glorious, must needs be factious; for all bravery stands upon comparisons. They must needs be violent, to make good their own vaunts. Neither can they be secret, and therefore not effectual; but according to the French proverb; *beaucoup de bruit, peu de fruit*: much bruit, little fruit. Yet certainly there is use of this quality, in civil affairs. Where there is an opinion, and fame to be created, either of virtue, or greatness, these men are good trumpeters. Again, as Titus Livius noteth, in the case of Antiochus, and the Aetolians; there are sometimes great effects of cross lies; as if a man that negotiates between two princes, to draw them to join in a war against the third, doth extol the forces of either of them above measure, the one to the other: and sometimes, he that deals between man and man, raiseth his own credit with both by pretending greater interest than he hath in either. And in these, and the like kinds, it often falls out that somewhat is produced of nothing: for lies are sufficient to breed opinion, and opinion brings on substance. In military commanders and soldiers, vainglory is an essential point; for as iron sharpens iron, so by glory one courage sharpeneth another. In cases of great enterprise, upon charge and adventure, a composition of glorious natures doth put life into business; and those that are of solid and sober natures have more of the ballast, than of the sail. In fame of learning, the flight will be slow, without some feathers of ostentation. *Qui de contemnenda gloria libros scribunt, nomen suum inscribunt.*^[1] Socrates, Aristotle, Galen, were men full of ostentation. Certainly vainglory helpeth to perpetuate a man's memory; and virtue was never so beholding to human nature, as it received his due at the second

hand. Neither had the fame of Cicero, Seneca, Plinius Secundus, borne her age so well, if it had not been joined with some vanity in themselves: like unto varnish, that makes sealings not only shine, but last. But all this while, when I speak of vainglory, I mean not of that property, that Tacitus doth attribute to Mucianus; *omnium, quae dixerat feceratque, arte quadam ostentator*:^[2] for that proceeds not of vanity, but of natural magnanimity, and discretion: and in some persons is not only comely, but gracious. For excusations, cessions, modesty itself well governed, are but arts of ostentation. And amongst those arts there is none better, than that which Plinius Secundus speaketh of; which is to be liberal of praise and commendation to others, in that wherein a man's self hath any perfection. For saith Pliny very wittily; In commending another, you do your self right; for he that you commend, is either superior to you, in that you commend, or inferior. If he be inferior, if he be to be commended, you much more; if he be superior, if he be not to be commended, you much less. Glorious men are the scorn of wise men; the admiration of fools; the idols of parasites; and the slaves of their own vaunts.

[1] Men who write books 'On the duty of despising Glory' allow their name to appear on thtle-page.

[2] He had an art of displaying to advantage all that he said and did.

55 Of Honour & Reputation

The winning of honour is but the revealing of a man's virtue and worth, without disadvantage. For some in their actions do woo and affect honour and reputation. Which sort of men are commonly much talked of, but inwardly little admired. And some, contrariwise, darken their virtue, in the show of it; so as they be undervalued in opinion. If a man perform that which hath not been attempted before; or attempted and given over, or hath been achieved, but not with so good circumstance; he shall purchase more honour, than by effecting a matter of greater difficulty, or virtue, wherein he is but a follower. If a man so temper his actions, as in some one of them he doth content every faction, or combination of people, the music will be the fuller. A man is an ill husband of his honour, that entereth into any action, the failing wherein may disgrace him more, than the carrying of it through can honour him. Honour that is gained and broken upon another, hath the quickest reflection; like diamonds cut with facets. And therefore, let a man contend to excel any competitors of his in honour, in out-shooting them, if he can, in their own bow. Discreet followers and servants help much to reputation. *Omnis fama a domesticis emanat.*^[1] Envy, which is the canker of honour, is best extinguished by declaring a man's self in his ends, rather to seek merit, than fame: and by attributing a man's successes, rather to divine providence and felicity, than to his own virtue or policy. The true marshalling of the degrees of sovereign honour are these. In the first place are *conditores imperiorum*; founders of states, and commonwealths: such as were Romulus, Cyrus, Caesar, Ottoman, Ismael. In the second place are *legislatores*, lawgivers; which are also called, second founders, or *perpetui principes*,^[2] because they govern by their ordinances, after they are gone: such were Lycurgus, Solon, Justinian, Eadgar, Alphonsus of Castile, the Wise, that made the *Siete Partidas*.^[3] In the third place are *liberatores*,^[4] or *salvatores*: such as

compound the long miseries of civil wars, or deliver their countries from servitude of strangers or tyrants; as Augustus Caesar, Vespasianus, Aurelianus, Theodoricus, Henry VII of England and Henry IV of France. In the fourth place are *propagatores* or *propugnatores imperii*;^[5] such as in honourable wars enlarge their territories, or make noble defence against invaders. And in the last place are *patres patriae*;^[6] which reign justly, and make the times good, wherein they live. Both which last kinds need no examples, they are in such number. Degrees of honour in subjects are; first, *participes curarum*;^[7] those upon whom princes do discharge the greatest weight of their affairs; their right hands, as we call them. The next are *duces belli*;^[8] great leaders; such as are princes' lieutenants, and do them notable services in the wars. The third are *gratiosi*, favourites; such as exceed not this scantling; to be solace to the sovereign, and harmless to the people. And the fourth, *negotiis pares*;^[9] such as have great places under princes, and execute their places with sufficiency. There is an honour likewise, which may be ranked amongst the greatest, which happeneth rarely: that is, of such as sacrifice themselves, to death or danger, for the good of their country: as was M. Regulus, and the two Decii.

[1] All reputation comes from those who are of a man's household.

[2] princes in perpetuity

[3] 'seven parts'(the title of a digest of the laws of Spain)

[4] deliverers or saviours

[5] extenders or defenders of empire

[6] fathers of their country

[7] associates in their cares

[8] military leaders

[9] (men who are) equal to conducting affairs

56 Of Judicature

Judges ought to remember, that their office is *ius dicere*, and not *ius dare*; to interpret law, and not to make law, or give law. Else will it be like the authority claimed by the church of Rome; which under pretext of exposition of scripture, doth not stick to add and alter, and to pronounce that which they do not find; and by show of antiquity, to introduce novelty. Judges ought to be more learned, than witty; more reverent, than plausible; and more advised, than confident. Above all things, integrity is their portion, and proper virtue. Cursed (saith the law) is he that removeth the landmark. The mislayer of a mere stone is to blame. But it is the unjust judge that is the capital remover of landmarks, when he defineth amiss of lands and property. One foul sentence doth more hurt, than many foul examples. For these do but corrupt the stream; the other corrupteth the fountain. So saith Solomon; *Fons turbatus, et vena corrupta, est iustus cadens in causa sua coram adversario*. The office of judges may have reference unto the parties that sue; unto the advocates that plead; unto the clerks and ministers of justice underneath them and to the sovereign or state above them.

First, for the causes or parties that sue. There be (saith the scripture) that turn judgement into wormwood; and surely, there be also, that turn it into vinegar, for injustice maketh it bitter, and delays make it sour. The principal duty of a judge is to suppress force and fraud; whereof force is the more pernicious, when it is open; and fraud, when it is close and disguised. Add thereto contentious suits, which ought to be spewed out, as the surfeit of courts. A judge ought to prepare his way to a just sentence, as God useth to prepare his way, by raising valleys, and taking down hills: so when there appeareth on either side, an high hand, violent prosecution, cunning advantages taken, combination, power, great counsel, then is the virtue of a judge

seen, to make inequality equal; that he may plant his judgement, as upon an even ground. *Qui fortiter emungit, elicit sanguinem*;^[1] and where the winepress is hard wrought, it yields a harsh wine, that tastes of the grapestone. Judges must beware of hard constructions, and strained inferences; for there is no worse torture, than the torture of laws. Specially in case of laws penal, they ought to have care, that that which was meant for terror be not turned into rigour; and that they bring not upon the people that shower, whereof the scripture speaketh; *pluet super eos laqueos*:^[2] for penal laws pressed, are a shower of snares upon the people. Therefore, let penal laws, if they have been sleepers of long, or if they be grown unfit for the present time, be by wise judges confined in the execution; *iudicis officium est, ut res, ita tempora rerum, etc.*^[3] In causes of life and death; judges ought (as far as the law permitteth) in justice to remember mercy; and to cast a severe eye upon the example, but a merciful eye upon the person.

Secondly, for the advocates and counsel that plead: patience and gravity of hearing is an essential part of justice; and an overspeaking judge is no well tuned cymbal. It is no grace to a judge, first to find that which he might have heard, in due time, from the bar, or to show quickness of conceit in cutting off evidence or counsel too short; or to prevent information, by questions though pertinent. The parts of a judge in hearing are four: to direct the evidence; to moderate length, repetition, or impertinency of speech; to recapitulate, select, and collate the material points of that which hath been said; and to give the rule or sentence. Whatsoever is above these, is too much; and proceedeth, either of glory and willingness to speak; or of impatience to hear, or of shortness of memory; or of want of a staid and equal attention. It is a strange thing to see, that the boldness of advocates should prevail with judges; whereas they should imitate God, in whose seat they sit; who represseth the presumptuous, and giveth grace to the modest. But it is more strange, that judges should have

noted favourites; which cannot but cause multiplication of fees, and suspicion of byways. There is due from the judge, to me advocate, some commendation and gracing, where causes are well handled, and fair pleaded; especially towards the side which obtaineth not; for that upholds, in the client, the reputation of his counsel, and beats down, in him, the conceit of his cause. There is likewise due to the public a civil reprehension of advocates, where there appeareth cunning counsel, gross neglect, slight information, indiscreet pressing, or an over-bold defence. And let not the counsel at the bar chop with the judge, nor wind himself into the handling of the cause anew, after the judge hath declared his sentence: but on the other side, let not the judge meet the cause half way; nor give occasion to the party to say; his counsel or proofs were not heard.

Thirdly, for that that concerns clerks, and ministers. The place of justice is an hallowed place; and therefore, not only the bench, but the footpace, and precincts, and purprise thereof, ought to be preserved without scandal and corruption. For certainly, graves (as the scripture saith) will not be gathered of thorns or thistles: neither can justice yield her fruit with sweetness, amongst the briars and brambles, of catching and polling clerks and ministers. The attendance of courts is subject to four bad instruments. First, certain persons that are the sowers of suits; which make the court swell, and the country pine. The second sort is of those that engage courts in quarrels of jurisdiction, and are not truly *amici curiae*, but *parasiti curiae*;^[4] in puffing a court up beyond her bounds, for their own scraps, and advantage. The third sort is of those that may be accounted the left hands of courts; persons that are full of nimble and sinister tricks and shifts, whereby they pervert the plain and direct courses of courts, and bring justice into oblique lines and labyrinths. And the fourth is, the poller and exacter of fees; which justifies the common resemblance of the courts of justice to the bush, whereunto while the sheep flies for defence in weather, he is sure to lose part of his fleece. On the other side, an

ancient clerk, skilful in precedents, wary in proceeding, and understanding in the business of the court, is an excellent finger of a court; and doth many times point the way to the judge himself.

Fourthly, for that which may concern the sovereign and estate. Judges ought above all to remember the conclusion of the Roman twelve tables; *salus populi suprema lex*;^[5] and to know that laws, except they be in order to that end, are but things captious, and oracles not well inspired. Therefore it is a happy thing in a state, when kings and states do often consult with judges; and again, when judges do often consult with the king and state: the one, when there is matter of law, intervenient in business of state; the other, when there is some consideration of state, intervenient in matter of law. For many times, the things deduced to judgement may be *meum and tuum*, when the reason and consequence thereof may trench to point of estate: I call matter of estate, not only the parts of sovereignty, but whatsoever introduceth any great alteration, or dangerous precedent; or concerneth manifestly any great portion of people. And let no man weakly conceive that just laws, and true policy, have any antipathy: for they are like the spirits, and sinews, that one moves with the other. Let judges also remember, that Solomon's throne was supported by lions, on both sides; let them be lions, but yet lions under the throne; being circumspect, that they do not check or oppose any points of sovereignty. Let not judges also be so ignorant of their own right, as to think there is not left to them, as a principal part of their office, a wise use, and application of laws. For they may remember, what the apostle saith, of a greater law than theirs; *nos scimus quia lex bona est, modo quis ea utatur legitime*.^[6]

罗歇斯（1583—1645），荷兰法学家。培根的好友。

[1] The wringing of the nose bringeth forth blood. (Proverbs xxx: 33).

[2] He shall rain snares upon them (Psalms ix: 6).

[3] It is a judge's office to inquire not only into the facts of a case, but into the times and occasions thereof.

[4] friends of the court... parasites of the court

[5] The people's welfare is the supreme law.

[6] We know that the law is good, provided that a man use it lawfully (I Timothy i; 8).

57 Of Anger

To seek to extinguish anger utterly, is but a bravery of the Stoics. We have better oracles: Be angry, but sin not. Let not the sun go down upon your anger. Anger must be limited, and confined, both in race, and in time. We will first speak, how the natural inclination, and habit, to be angry, may be attempered, and calmed. Secondly, how the particular motions of anger may be repressed, or at least refrained from doing mischief. Thirdly, how to raise anger, or appease anger, in another.

For the first; there is no other way, but to meditate and ruminate well upon the effects of anger, how it troubles man's life. And the best time to do this, is to look back upon anger, when the fit is thoroughly over. Seneca saith well; that anger is like ruin, which forsakes itself upon that it falls. The scripture exhorteth us; to possess our souls in patience. Whosoever is out of patience, is out of possession of his soul. Men must not turn bees;

animasque in vulnere ponunt.^[1]

Anger is certainly a kind of baseness: as it appears well, in the weakness of those subjects, in whom it reigns; children, women, old folks, sick folks. Only men must beware, that they carry their anger rather with scorn, than with fear: so that they may seem rather to be above the injury, than below it: which is a thing easily done, if a man will give law to himself in it.

For the second point; the causes and motives of anger, are chiefly three. First, to be too sensible of hurt: for no man is angry, that feels not himself hurt: and therefore tender and delicate persons must needs be oft angry: they have so many things to trouble them; which more robust natures have little sense of. The next is, the apprehension and

construction of the injury offered, to be, in the circumstances thereof, full of contempt. For contempt is that which putteth an edge upon anger, as much, or more, than the hurt itself. And therefore, when men are ingenious in picking out circumstances of contempt, they do kindle their anger much. Lastly, opinion of the touch of a man's reputation doth multiply and sharpen anger. Wherein the remedy is, that a man should have, as Consalvo was wont to say, *telam honoris crassiozem*.^[2] But in all refrainings of anger, it is the best remedy to win time; and to make a man's self believe, that the opportunity of his revenge is not yet come: but that he foresees a time for it; and so to still himself in the mean time, and reserve it .

To continue anger from mischief, though it take hold of a man, there be two things whereof you must have special caution. The one, of extreme bitterness of words; especially, if they be accurate, and proper: for *communia maledicta*^[3] are nothing so much: and again, that in anger, a man reveal no secrets: for that makes him not fit for society. The other, that you do not peremptorily break off, in any business, in a fit of anger: but howsoever you show bitterness, do not act anything that is not revocable.

For raising and appeasing anger in another, it is done chiefly by choosing of times. When men are frowardest and worst disposed, to incense them. Again, by gathering (as was touched before) all that you can find out, to aggravate the contempt. And the two remedies are by the contraries. The former, to take good times, when first to relate to a man an angry business: for the first impression is much. And the other is, to sever, as much as may be, the construction of the injury from the point of contempt: imputing it to misunderstanding, fear, passion, or what you will.

[1] and leave their lives ['souls'] in the wound

[2] honour of a coarser web

[3] ill words applicable to all and sundry

58 Of Vicissitude of Things

Solomon saith; There is no new thing upon the earth. So that as Plato had an imagination, that all knowledge was but remembrance: so Solomon giveth his sentence, that all novelty is but oblivion. Whereby you may see, that the river of Lethe runneth as well above ground, as below. There is an abstruse astrologer that saith; If it were not for two things, that are constant (the one is, that the fixed stars ever stand at like distance, one from another, and never come nearer together, nor go further asunder, the other, that the diurnal motion perpetually keepeth time); no individual would last one moment. Certain it is, that the matter is in a perpetual flux, and never at a stay. The great winding-sheets, that bury all things in oblivion, are two; deluges, and earthquakes. As for conflagrations, and great droughts, they do not merely dispeople, and destroy. Phaeton's car went but a day. And the three years' drought, in the time of Elias, was but particular, and left people alive. As for the great burnings by lightnings, which are often in the West Indies, they are but narrow. But in the other two destructions, by deluge, and earthquake, it is further to be noted, that the remnant of people which hap to be preserved, are commonly ignorant and mountainous people, that can give no account of the time past: so that the oblivion is all one, as if none had been left. If you consider well, of the people of the West Indies, it is very probable that they are newer or a younger people, than the people of the old world. And it is much more likely, that the destruction that hath heretofore been there, was not by earthquakes (as the Egyptian priest told Solon, concerning the Island of Atlantis; that it was swallowed by an earthquake), but rather, that it was desolated by a particular deluge. For earthquakes are seldom in those parts. But on the other side, they have such pouring rivers, as the rivers of Asia and Africa and Europe are but brooks to them. Their Andes likewise, or mountains, are far higher than those with us;

whereby it seems that the remnants of generation of men were, in such a particular deluge, saved. As for the observation, that Macbeth hath, that the jealousies of sects doth much extinguish the memory of things; traducing Gregory the Great, that he did what in him lay, to extinguish all heathen antiquities; I do not find that those zeals do any great effects, nor last long: as it appeared in the succession of Sabinian, who did revive the former antiquities.

The vicissitudes or mutations in the superior globe, are no fit matter for this present argument. It may be, Plato's great year, if the world should last so long, would have some effect; not in renewing the state of like individuals (for that is the fume of those that conceive the celestial bodies have more accurate influences upon these things below, than indeed they have), but in gross. Comets, out of question, have likewise power and effect, over the gross and mass things: but they are rather gazed upon, and waited upon in their journey, than wisely observed in their effects; specially in their respective effects; that is, what kind of comet, for magnitude, colour, version of the beams, placing in the region of heaven, or lasting, produceth what kind of effects.

There is a toy which I have heard, and I would not have it given over, but waited upon a little. They say, it is observed in the Low Countries (I know not in what part) that every five and thirty years, the same kind and suit of years and weathers comes about again: as great frosts, great wet, great droughts, warm winters, summers with little heat, and the like: and they call it the prime. It is a thing I do the rather mention, because computing backwards, I have found some concurrence.

But to leave these points of nature, and to come to men. The greatest vicissitude of things amongst men, is the vicissitude of sects and religions. For those orbs rule in men's minds most. The true religion is built upon the rock; the rest are tossed upon the waves of

time. To speak therefore, of the causes of new sects; and to give some counsel concerning them; as far as the weakness of human judgement, can give stay to so great revolutions.

When the religion formerly received is rent by discords; and when the holiness of the professors of religion is decayed, and full of scandal; and withal the times be stupid, ignorant, and barbarous; you may doubt the springing up of a new sect; if then also there should arise any extravagant and strange spirit, to make himself author thereof. All which points held, when Mohammed published his law. If a new sect have not two properties, fear it not: for it will not spread. The one is, the supplanting, or the opposing, of authority established: for nothing is more popular than that. The other is, the giving licence to pleasures, and a voluptuous life. For as for speculative heresies (such as were in ancient times the Arians, and now the Armenians) though they work mightily upon men's wits, yet they do not produce any great alterations in states; except it be by the help of civil occasions. There be three manner of plantations of new sects. By the power of signs and miracles: by the eloquence and wisdom of speech and persuasion: and by the sword. For martyrdoms, I reckon them amongst miracles; because they seem to exceed the strength of human nature: and I may do the like of superlative and admirable holiness of life. Surely, there is no better way to stop the rising of new sects, and schisms; than to reform abuses; to compound the smaller differences; to proceed mildly, and not with sanguinary prosecutions; and rather to take off the principal authors, by winning and advancing them, than to enrage them by violence and bitterness.

The changes and vicissitude in wars are many: but chiefly in three things; in the seats or stages of the war, in the weapons; and in the manner of the conduct. Wars in ancient time seemed more to move from east to west: for the Persians, Assyrians, Arabians, Tartars, (which were the invaders) were all eastern people. It is true, the Gauls

were western; but we read but of two incursions of theirs; the one to Gallo-Graecia, the other to Rome. But east and west have no certain points of heaven: and no more have the wars, either from the east, or west, any certainty of observation. But north and south are fixed; and it hath seldom or never been seen, that the far southern people have invaded the northern, but contrariwise. Whereby it is manifest, that the northern tract of the world is in nature the more martial region: be it in respect of the stars of that hemisphere; or of the great continents that are upon the north, whereas the south part, for ought that is known, is almost all sea; or (which is most apparent) of the cold of the northern parts, which is that which without aid of discipline doth make the bodies hardest, and me courages warmest.

Upon the breaking and shivering of a great state and empire, you may be sure to have wars. For great empires, while they stand, do enervate and destroy the forces of the natives, which they have subdued, resting upon their own protecting forces: and then when they fail also, all goes to ruin, and they become a prey. So was it, in the decay of the Roman empire; and likewise, in the empire of Almaigne, after Charles the Great, every bird taking a feather, and were not unlike to befall to Spain, if it should break. The great accessions and unions of kingdoms do likewise stir up quarrel. For when a state grows to an over-power, it is like a great flood, that will be sure to overflow. As it hath been seen, in the states of Rome, Turkey, Spain, and others. Look when the world hath fewest barbarous peoples, but such as commonly will not marry or generate, except they know means to live (as it is almost everywhere at this day, except Tartary); there is no danger of inundations of people: but when there be great shoals of people, which go on to populate, without foreseeing means of life and sustentation, it is of necessity, that once in an age or two, they discharge a portion of their people upon other nations: which the ancient northern people were wont to do by lot: casting lots, what part should stay at home, and what should seek

their fortunes. When a warlike state grows soft and effeminate, they may be sure of a war. For commonly such states are grown rich, in the time of their degenerating; and so the prey inviteth, and their decay in valour encourageth a war.

As for the weapons, it hardly falleth under rule and observation: yet we see, even they have returns and vicissitudes. For certain it is, that ordnance was known in the city of the Oxidrakes in India: and was that, which the Macedonians called thunder and lightning, and magic. And it is well known, that the use of ordnance hath been in China above two thousand years. The conditions of weapons, and their improvement are; first, the fetching a far off: for that outruns the danger: as it is seen in ordnance and muskets. Secondly, the strength of the percussion; wherein likewise ordnance do exceed all arietations, and ancient inventions. The third is, the commodious use of them: as that they may serve in all weathers; that the carriage may be light and manageable; and the like.

For the conduct of the war: at the first, men rested extremely upon number: they did put the wars likewise upon main force, and valour, pointing days for pitched fields, and so trying it out, upon an even match: and they were more ignorant in ranging and arraying their battles. After they grew to rest upon number, rather competent, than vast: they grew to advantages of place, cunning diversions, and the like: and they grew more skilful in the ordering of their battles.

In the youth of a state, arms do flourish: in the middle age of a state, learning; and then both of them together for a time: in the declining age of a state, mechanical arts and merchandise. Learning hath his infancy, when it is but beginning, and almost childish: then his youth, when it is luxuriant and juvenile: then his strength of years, when it is solid and reduced: and lastly, his old age, when it waxeth dry and exhaust. But it is not good, to look too long upon these turning wheels of vicissitude, lest we become giddy. As for the

philology of them, that is but a circle of tales, and therefore not fit for this writing.

A Fragment of An Essay of Fame

The poets make fame a monster. They describe her, in part, finely, and elegantly; and, in part, gravely, and sententiously. They say, look how many feathers she hath. so many eyes she hath underneath: so many tongues; so many voices; she pricks up so many ears.

This is a flourish: there follow excellent parables; as that, she gathereth strength in going; that she goeth upon the ground, and yet hideth her head in the clouds. That, in the day time, she sitteth in a watch tower, and flieth most by night: that she mingleth things done, with things not done: and that she is a terror to great cities: but that which passeth all the rest, is: they do recount that the earth, mother of the giants that made war against Jupiter, and were by him destroyed, thereupon, in an anger, brought forth fame: for certain it is, that rebels, figured by the giants, and seditious fames, and libels, are but brothers, and sisters; masculine, and feminine. But now, if a man can tame this matter, and bring her to feed at the hand, and govern her, and with her fly other ravening fowl, and kill them, it is somewhat worth. But we are infected with the style of the poets. To speak now in a sad, and serious manner: there is not, in all the politics, a place less handled, and more worthy to be handled, than this of fame. We will, theretofore, speak of these points. What are false fames; and what are true fames; and how they may be best discerned; how fames may be sown, and raised; how they may be spread, and multiplied; and how they may be checked, and laid dead. And other things, concerning the nature of fame. Fame is of that force, as there is scarcely any great action wherein it hath not a great part; especially, in the war. Mucianus undid Vitellius by a fame that he scattered; that Vitellius had in purpose, to remove the legions of Syria into Germany; and the regions of Germany into Syria: whereupon the legions of Syria

were infinitely inflamed. Julius Caesar took Pompey unprovided, and laid asleep his industry, and preparations, by a fame that he cunningly gave out; how Caesar's own soldiers loved him not; and being wearied with the wars, and laden with the spoils of Gaul, would forsake him, as soon as he came into Italy. Livia settled all things, for the succession of her son Tiberius, by continual giving out that her husband Augustus was upon recovery, and amendment. And it is an usual thing, with the bashaws, to conceal the death of the great Turk from the Janissaries, and men of war, to save the sacking of Constantinople, and other towns, as their manner is. Themistocles made Xerxes, king of Persia, post apace out of Graecia, by giving out that the Grecians had a purpose to break his bridge of ships, which he made athwart Hellespont. There be a thousand such like examples; and the more they are, the less they need to be repeated; because a man meeteth with them everywhere: therefore, let all wise governors have as great a watch, and care, over fames, as they have of the actions and designs themselves.

The rest was not finished.

约翰·洛克

1632 29 August: Born Wrington, Somerset.

1646 Admitted to Westminster School , London.

1652 Elected to studentship at Christ Church , Oxford.

1656 Graduates BA.

1658 Graduates MA.

1660 Writes first tract on the Civil Magistrate.

1661 Father dies.

1661-2 Writes second tract on the Civil Magistrate.

1664 Censor of Moral Philosophy at Christ Church. Writes 'Essays on the Law of Nature'.

1667 Joins household of Lord Ashley, future first earl of Shaftesbury.

Writes 'An Essay concerning Toleration'.

1668 Elected Fellow of the Royal Society.

1671 Writes first drafts of 'Essay concerning Human Understanding'.

1673-4 Secretary to Council of Trade and Foreign Plantations.

1675 Graduates MB.

1675-9 In France (Paris and Montpellier).

1680-82 Writes 'Two Treatises of Government'.

1683-9 In Holland.

1689 Returns to London ; anonymous publication of 'A Letter concerning Toleration' and of 'Two Treatises of Government' ; publication of 'An Essay concerning Human Understanding'(dated 1690).

1690 Moves from London to Oates , Essex ; anonymous publication of 'Second Letter concerning Toleration'.

1691 Publication of 'Some Consideration of the Consequences of the Lowering of Interest and Raising the Value of Money'.

1692 Anonymous publication of 'Third Letter concerning

Toleration’.

1693 Publication of ‘Some Thoughts concerning Education’.

1694 Publication of second edition of ‘Essay concerning Human Understanding’.

1695 Publication of ‘Further Considerations concerning Raising the Value of Money’ and of third edition of ‘Essay concerning Human Understanding’; anonymous publication of ‘The Reasonableness of Christianity’ and of ‘Vindication of the Reasonableness of Christianity’.

1696 Appointed to the Commission for Trade and Plantations (Board of Trade).

1697 Publication of ‘A Letter’ and ‘A Reply’ to Bishop Stillingfleet; anonymous publication of ‘Second Vindication of the Reasonableness of Christianity’.

1698 Publication of a further ‘Reply’ to Stillingfleet.

1699 Publication of fourth edition of ‘Essay concerning Human Understanding’.

1700 Resigns from Board of Trade . Publication of French translation of ‘Essay concerning Human Understanding’.

1701 Publication of Latin translation of ‘Essay concerning Human Understanding’.

1704 28 October: Dies Oates, Essex.

The Epistle Dedicatory

To the Right Honourable Thomas Earl of Pembroke and
Montgomery,

Baron Herbert of Cardiff, Lord Ross Of Kendal, Par,
Fitzhugh, Marmion, St. Quintin, and Shurland; Lord President of his
Majesty's most Honourable Privy-Council; and Lord Lieutenant of the
County of Wilts, and of South Wales.

MY LORD,

This treatise, which is grown up under your Lordship's eye, and has ventured into the world by your order, does now, by a natural kind of right, come to your Lordship for that protection which you several years since promised it. 'Tis not that I think any name, how great soever, set at the beginning of a book, will be able to cover the faults are to be found in it. Things in print must stand and fall by their own worth, or the reader's fancy. But there being nothing more to be desired for truth than a fair unprejudiced hearing, nobody is more likely to procure me that, than your Lordship, who are allowed to have got so intimate an acquaintance with her, in her more retired recesses. Your Lordship is known to have so far advanced your speculations in the most abstract and general knowledge of things, beyond the ordinary reach or common methods, that your allowance and approbation of the design of this treatise, will at least preserve it from being condemned without reading; and will prevail to have those parts a little weighted, which might otherwise perhaps be thought to deserve no consideration, for being somewhat out of the common road. The imputation of novelty, is a terrible charge amongst those, who judge of men's heads, as they do of their perukes, by the fashion; and can allow none to be right but the received doctrines. Truth scarce ever yet carried it by vote anywhere at its first appearance: new opinions are always suspected, and usually opposed, without any other reason, but because they are not already common. But truth, like gold, is not the less so, for being newly brought out of the mine. 'Tis trial and examination must give it price, and not any antique fashion: and though it be not yet current by the public stamp; yet it may, for all that, be as old as nature, and is certainly not the less genuine. Your Lordship can give great and convincing instances of

this, whenever you please to oblige the public with some of those large and comprehensive discoveries you have made, of truths, hitherto unknown, unless to some few, to whom your Lordship has been pleased not wholly to conceal them. This alone were a sufficient reason, were there no other, why I should dedicate this Essay to your Lordship; and its having some little correspondence with some parts of that nobler and vast system of the sciences your Lordship has made, so new, exact, and instructive a draught of, I think it glory enough, if your lordship permit me to boast, that here and there I have fallen into some thoughts not wholly different from yours. If your Lordship think fit, that, by your encouragement, this should appear in the world, I hope it may be a reason, some time or other, to lead your Lordship further; and you will allow me to say, that you here give the world an earnest of something that, if they can bear with this, will be truly worth their expectation. This, my Lord, shows what a present I here make to your Lordship; just such as the poor man does to his rich and great neighbour, by whom the basket of flowers or fruit is not ill taken, though he has more plenty of his own growth, and in much greater perfection. Worthless things receive a value, when they are made the offerings of respect, esteem, and gratitude: these you have given me so mighty and peculiar reasons to have, in the highest degree, for your Lordship, that if they can add a price to what they go along with, proportionable to their own greatness, I can with confidence brag, I here make your Lordship the richest present, you ever received. This I am sure, I am under the greatest obligations to seek all occasions to acknowledge a long train of favours, I have received from your lordship; favours, though great and important in themselves, yet made much more so by the forwardness, concern, and kindness, and other obliging circumstances, that never failed to accompany them. To all this you are pleased to add that which gives yet more weight and relish to all the rest: you vouchsafe to continue me in some degrees of your esteem, and allow me a place in your good thoughts, I had almost said friendship. This, my Lord, your words and actions so constantly show on all occasions, even to others when I am absent, that 'tis not vanity in me to mention what everybody knows: but it would be want of good manners, not to acknowledge what so many are witnesses of, and every day tell me, I am indebted to your Lordship for. I wish they could as easily assist my gratitude, as they convince me of the great and growing engagements it has to your Lordship. This I am sure, I should write of the understanding without having any, if I were not extremely sensible of

them, and did not lay hold on this opportunity to testify to the world,
how much I am obliged to be, and how much I am,

Dorset Court

24th of May, 1689

My Lord,

Your Lordship's

Most Humble, and

Most Obedient Servant,

JOHN LOCKE

The Epistle to the Reader

Reader,

I here put into thy hands, what has been the diversion of some of my idle and heavy hours: if it has the good luck to prove so of any of thine, and thou hast but half so much pleasure in reading, as I had in writing it, thou wilt as little think thy money, as I do my pains, ill bestowed. Mistake not this, for a commendation of my work; nor conclude, because I was pleased with the doing of it, that therefore I am fondly taken with it now 'tis done. He that hawks at larks and sparrows, has no less sport, though a much less considerable quarry, than he that flies at nobler game: and he is little acquainted with the subject of this treatise, the UNDERSTANDING, who does not know that, as 'tis the most elevated faculty of the soul, so 'tis employed with a greater, and more constant delight, than any of the other. Its searches after truth, are a sort of hawking and hunting, wherein the very pursuit makes a great part of the pleasure. Every step the mind takes in its progress towards knowledge, makes some discovery, which is not only new, but the best too, for the time at least.

For the understanding, like the eye, judging of objects only by its own sight, cannot but be pleased with what it discovers, having less regret for what has escaped it, because 'tis unknown. Thus he who has raised himself above the alms-basket, and not content to live lazily on scraps of begged opinions, sets his own thoughts on work, to find and follow truth, will (whatever he lights on) not miss the hunter's satisfaction; every moment of his pursuit, will reward his pains with some delight; and he will have reason to think his time not ill spent, even when he cannot much boast of any great acquisition.

This, reader, is the entertainment of those, who let loose their own thoughts, and follow them in writing; which thou oughtest not to envy them, since they afford thee an opportunity of the like diversion, if thou wilt make use of thy own thoughts in reading. 'Tis to them, if they are thy own, that I refer myself: but if they are taken upon trust from others, 'tis no great matter what they are, they not following truth, but some meaner consideration, and 'tis not worth while to be concerned, what he says or thinks, who says or thinks only as he is directed by another. If thou judgest for thyself, I know thou

wilt judge candidly; and then I shall not be harmed or offended, whatever be thy censure. For though it be certain, that there is nothing in this treatise, of the truth whereof I am not fully persuaded; yet I consider myself as liable to mistakes, as I can think thee; and know, that this book must stand or fall with thee, not by any opinion I have of it, but thy own. If thou findest little in it new or instructive to thee, thou art not to blame me for it. It was not meant for those that had already mastered this subject, and made a thorough acquaintance with their own understandings; but for my own information, and the satisfaction of a few friends, who acknowledged themselves not to have sufficiently considered it. Were it fit to trouble thee with the history of this essay, I should tell thee that five or six friends meeting at my chamber, and discoursing on a subject very remote from this, found themselves quickly at a stand, by the difficulties that rose on every side. After we had a while puzzled ourselves, without coming any nearer a resolution of those doubts which perplexed us, it came into my thoughts, that we took a wrong course; and that, before we set ourselves upon inquiries of that nature, it was necessary to examine our own abilities, and see what objects our understandings were, or were not fitted to deal with. This I proposed to the company, who all readily assented; and thereupon it was agreed, that this should be our first inquiry. Some hasty and undigested thoughts, on a subject I had never before considered, which I set down against our next meeting, gave the first entrance into this discourse, which having been thus begun by chance, was continued by intreaty; written by incoherent parcels; and after long intervals of neglect, resumed again, as my humour or occasions permitted; and at last, in a retirement, where an attendance on my health gave me leisure, it was brought into that order thou now seest it.

This discontinued way of writing, may have occasioned, besides others, two contrary faults, viz. that too little and too much may be said in it. If thou findest anything wanting, I shall be glad that what I have writ, gives thee any desire, that I should have gone further: if it seems too much to thee, thou must blame the subject; for when I first put pen to paper, I thought all I should have to say on this matter, would have been contained in one sheet of paper; but the further I went, the larger prospect I had: new discoveries led me still on, and so it grew insensibly to the bulk it now appears in. I will not deny, but possibly it might be reduced to a narrower compass than 'tis; and that some parts of it might be contracted: the way it has been writ

in, by catches, and many long intervals of interruption, being apt to cause some repetitions. But to confess the truth, I am now too lazy, or too busy, to make it shorter.

I am not ignorant how little I herein consult my own reputation, when I knowingly let it go with a fault, so apt to disgust the most judicious, who are always the nicest readers. But they who know sloth is apt to content itself with any excuse, will pardon me, if mine has prevailed on me, where, I think, I have a very good one. I will not therefore allege in my defence, that the same notion, having different respects, may be convenient or necessary to prove or illustrate several parts of the same discourse; and that so it has happened in many parts of this: but waiving that, I shall frankly avow, that I have sometimes dwelt long upon the same argument, and expressed it different ways, with a quite different design. pretend not to publish this essay for the information of men of large thoughts and quick apprehensions; to such masters of knowledge, I profess myself a scholar, and therefore warn them beforehand not to expect anything here, but what being spun out of my own coarse thoughts, is fitted to men of my own size, to whom, perhaps, it will not be unacceptable, that I have taken some pains to make plain and familiar to their thoughts some truths, which established prejudice, or the abstractedness of the ideas themselves, might render difficult. Some objects had need be turned on every side; and when the notion is new, as I confess some of these are to me or out of the ordinary road, as I suspect they will appear to others, 'tis not one simple view of it, that will gain it admittance into every understanding, or fix it there with a clear and lasting impression. There are few, I believe, who have not observed in themselves or others, that what in one way of proposing was very obscure, another way of expressing it, has made very clear and intelligible: though afterwards the mind found little difference in the phrases, and wondered why one failed to be understood more than the other. But everything does not hit alike upon every man's imagination. We have our understandings no less different, than our palates; and he that thinks the same truth shall be equally relished by everyone in the same dress, may as well hope to feast everyone with the same sort of cookery: the meat may be the same, and the nourishment good, yet every one not be able to receive it with that seasoning; and it must be dressed another way, if you will have it go down with some, even of strong constitutions. The truth is, those who advised me to publish it, advised me, for this reason, to publish it as 'tis: and since I have been

brought to let it go abroad, I desire it should be understood by whoever gives himself the pains to read it. I have so little affection to be in print, that if I were not flattered this essay might be of some use to others, as I think it has been to me; I should have confined it to the view of some friends, who gave the first occasion to it. My appearing therefore in print, being on purpose to be as useful as I may, I think it necessary to make what I have to say, as easy and intelligible to all sorts of readers, as I can. And I had much rather the speculative and quicksighted should complain of my being in some parts tedious, than that any one, not accustomed to abstract speculations, or prepossessed with different notions, should mistake, or not comprehend my meaning.

It will possibly be censured as a great piece of vanity or insolence in me, to pretend to instruct this our knowing age, it amounting to little less, when I own, that I publish this essay with hopes it may be useful to others. But if it may be permitted to speak freely of those, who with a feigned modesty condemn as useless, what they themselves write, methinks it savours much more of vanity or insolence, to publish a book for any other end; and he fails very much of that respect he owes the public, who prints, and consequently expects men should read that, wherein he intends not they should meet with anything of use to themselves or others: and should nothing else be found allowable in this treatise, yet my design will not cease to be so; and the goodness of my intention ought to be some excuse for the worthlessness of my present. 'Tis that chiefly which secures me from the fear of censure, which I expect not to escape more than better writers. Men's principles, notions, and relishes are so different, that 'tis hard to find a book which pleases or displeases all men. I acknowledge the age we live in is not the least knowing, and therefore not the most easy to be satisfied. If I have not the good luck to please, yet nobody ought to be offended with me. I plainly tell all my readers, except half a dozen, this treatise was not at first intended for them; and therefore they need not be at the trouble to be of that number. But yet if any one thinks fit to be angry, and rail at it, he may do it securely: for I shall find some better way of spending my time, than in such kind of conversation. I shall always have the satisfaction to have aimed sincerely at truth and usefulness, though in one of the meanest ways. The commonwealth of learning, is not at this time without master-builders, whose mighty designs, in advancing the sciences, will leave lasting monuments to the admiration of posterity: But everyone

must not hope to be a Boyle, or a Sydenham; and in an age that produces such masters, as the great Huygenius, and the incomparable Mr Newton, with some other of that strain; 'tis ambition enough to be employed as an under-labourer in clearing ground a little, and removing some of the rubbish that lies in the way to knowledge; which certainly had been very much more advanced in the world, if the endeavours of ingenious and industrious men had not been much cumbered with the learned but frivolous use of uncouth, affected, or unintelligible terms, introduced into the sciences, and there made an art of, to that degree, that philosophy, which is nothing but the true knowledge of things, was thought unfit, or incapable to be brought into wellbred company, and polite conversation. Vague and insignificant forms of speech, and abuse of language, have so long passed for mysteries of science; and hard and misapplied words, with little or no meaning, have, by prescription, such a right to be mistaken for deep learning, and height of speculation, that it will not be easy to persuade, either those who speak, or those who hear them, that they are but the covers of ignorance, and hindrance of true knowledge. To break in upon the sanctuary of vanity and ignorance, will be, I suppose, some service to human understanding: though so few are apt to think, they deceive, or are deceived in the use of words; or that the language of the sect they are of, has any faults in it, which ought to be examined or corrected, that I hope I shall be pardoned if I have in the third book dwelt long on this subject; and endeavoured to make it so plain, that neither the inveterateness of the mischief, nor the prevalency of the fashion, shall be any excuse for those, who will not take care about the meaning of their own words, and will not suffer the significancy of their expressions to be inquired into.

I have been told, that a short epitome of this treatise, which was printed in 1688, was by some condemned without reading, because innate ideas were denied in it; they too hastily concluding, that if innate ideas were not supposed, there would be little left either of the notion or proof of spirits. If any one take the like offence at the entrance of this treatise, I shall desire him to read it through; and then I hope he will be convinced, that the taking away false foundations, is not to the prejudice, but advantage of truth; which is never injured or endangered so much, as when mixed with, or built on, falsehood. In the second edition I added as followeth:

The bookseller will not forgive me, if I say nothing of this second

edition, which he has promised, by the correctness of it, shall make amends for the many faults committed in the former. He desires too, that it should be known, that it has one whole new chapter concerning identity, and many additions and amendments in other places. These I must inform my reader are not all new matter, but most of them either further confirmation of what I had said, or explications to prevent others being mistaken in the sense of what was formerly printed, and not any variation in me from it; I must only except the alterations I have made in Book 2. Chap. 21.

What I had there writ concerning liberty and the will, I thought deserved as accurate a review, as I was capable of: those subjects having in all ages exercised the learned part of the world, with questions and difficulties, that have not a little perplexed morality and divinity; those parts of knowledge, that men are most concerned to be clear in. Upon a closer inspection into the working of men's minds, and a stricter examination of those motives and views, they are turned by, I have found reason somewhat to alter the thoughts I formerly had concerning that, which gives the last determination to the will in all voluntary actions. This I cannot forbear to acknowledge to the world, with as much freedom and readiness, as I at first published what then seemed to me to be right, thinking myself more concerned to quit and renounce any opinion of my own, than oppose that of another, when truth appears against it. For 'tis truth alone I seek, and that will always be welcome to me, when or from whencesoever it comes.

But what forwardness soever I have to resign any opinion I have, or to recede from anything I have writ, upon the first evidence of any error in it; yet this I must own, that I have not had the good luck to receive any light from those exceptions I have met with in print against any part of my book; nor have, from anything has been urged against it, found reason to alter my sense, in any of the points have been questioned. Whether the subject I have in hand, requires often more thought and attention, than cursory readers, at least such as are prepossessed, are willing to allow. Or whether any obscurity in my expressions casts a cloud over it, and these notions are made difficult to others' apprehension in my way of treating them. So 'tis, that my meaning, I find, is often mistaken, and I have not the good luck to be everywhere rightly understood. There are so many instances of this, that I think it justice to my reader and myself, to conclude, that either my book is plainly enough written to be rightly understood by those,

who peruse it with that attention and indifferency, which everyone, who will give himself the pains to read, ought to employ in reading; or else that I have writ mine so obscurely, that 'tis in vain to go about to mend it. Whichever of these be that truth, 'tis my self only am affected thereby, and therefore I shall be far from troubling my reader with what I think might be said, in answer to those several objections I have met with, to passages here and there of my book. Since I persuade myself, that he who thinks them of moment enough to be concerned, whether they are true or false, will be able to see, that what is said, is either not well founded, or else not contrary to my doctrine, when I and my opposer come both to be well understood.

If any, careful that none of their good thoughts should be lost, have published their censures of my essay, with this honour done to it, that they will not suffer it to be an essay, I leave it to the public to value the obligation they have to their critical pens, and shall not waste my reader's time in so idle or ill-natured an employment of mine, as to lessen the satisfaction any one has in himself, or gives to others in so hasty a confutation of what I have written.

The booksellers preparing for the fourth edition of my essay, gave me notice of it, that I might, if I had leisure, make any additions or alterations I should think fit. Whereupon I thought it convenient to advertise the reader, that besides several corrections I had made here and there, there was one alteration which it was necessary to mention, because it ran through the whole book, and is of consequence to be rightly understood. What I thereupon said, was this:

Clear and distinct ideas, are terms, which though familiar and frequent in men's mouths, I have reason to think everyone, who uses, does not perfectly understand. And possibly 'tis but here and there one who gives himself the trouble to consider them so far as to know what he himself or others precisely mean by them: I have therefore in most places chose to put determinate or determined, instead of clear and distinct, as more likely to direct men's thoughts to my meaning in this matter. By those denominations, I mean some object in the mind, and consequently determined, i.e. such as 'tis there seen and perceived to be. This, I think, may fitly be called a determinate or determined idea, when such as 'tis at any time objectively in the mind, and so determined there, 'tis annexed, and without variation determined to a name or articulate sound, which is to be steadily the sign of that very

same object of the mind, or determinate idea.

To explain this a little more particularly. By determinate, when applied to a simple idea, I mean that simple appearance which the mind has in its view, or perceives in itself, when that idea is said to be in it: by determined, when applied to a complex idea, I mean such an one as consists of a determinate number of certain simple or less complex ideas, joined in such a proportion and situation, as the mind has before its view, and sees in itself when that idea is present in it, or should be present in it, when a man gives a name to it. I say should be: because 'tis not every one, nor perhaps any one, who is so careful of his language, as to use no word, till he views in his mind the precise determined idea, which he resolves to make it the sign of. The want of this, is the cause of no small obscurity and confusion in men's thoughts and discourses.

I know there are not words enough in any language, to answer all the variety of ideas, that enter into men's discourses and reasonings. But this hinders not, but that when anyone uses any term, he may have in his mind a determined idea, which he makes it the sign of, and to which he should keep it steadily annexed during that present discourse. Where he does not, or cannot do this, he in vain pretends to clear or distinct ideas: 'tis plain his are not so: and therefore there can be expected nothing but obscurity and confusion, where such terms are made use of, which have not such a precise determination.

Upon this ground I have thought determined ideas a way of speaking less liable to mistakes, than clear and distinct: and where men have got such determined ideas of all that they reason, inquire, or argue about, they will find a great part of their doubts and disputes at an end. The greatest part of the questions and controversies that perplex mankind, depending on the doubtful and uncertain use of words, or (which is the same) indetermined ideas, which they are made to stand for. I have made choice of these terms to signify, 1. some immediate object of the mind, which it perceives and has before it distinct from the sound it uses as a sign of it. 2. That this idea thus determined, i.e. which the mind has in itself, and knows, and sees there be determined without any change to that name, and that name determined to that precise idea. If men had such determined ideas in their inquiries and discourses, they would both discern how far their own inquiries and discourses went, and avoid the greatest part of the

disputes and wranglings they have with others.

Besides this, the bookseller will think it necessary I should advertise the reader, that there is an addition of two chapters wholly new; the one of the association of ideas, the other of enthusiasm. These, with some other larger additions never before printed, he has engaged to print by themselves after the same manner, and for the same purpose as was done when this Essay had the second impression.

In this fifth edition, there is very little added or altered, the greatest part of what is new, is contained in the 21 chapter of the second book, which any, one, if he thinks it worth the while, may, with a very little labour, transcribe into the margin of the former edition.

BOOK I: Of Innate Notions

Chapter I Introduction

§1. An inquiry into the understanding, pleasant and useful. Since 'tis the understanding that sets man above the rest of sensible beings, and gives him all the advantage and dominion, which he has over them; 'tis certainly a subject, even for its nobleness, worth our labour to inquire into. The understanding, like the eye, whilst it makes us see and perceive all other things, takes no notice of itself: and it requires art and pains to set it at a distance, and make it its own object. But whatever be the difficulties, that lie in the way of this inquiry; whatever it be, that keeps us so much in the dark to ourselves; sure I am, that all the light we can let in upon our own minds; all the acquaintance we can make with our own understandings, will not only be very pleasant, but bring us great advantage, in directing our thoughts in the search of other things.

§2. Design. This, therefore, being my purpose to inquire into the original, certainty, and extent of human knowledge; together with the grounds and degrees of belief, opinion, and assent; I shall not at present meddle with the physical consideration of the mind; or trouble myself to examine, wherein its essence consists, or by what motions of our spirits, or alterations of our bodies, we come to have any sensation by our organs, or any ideas in our understandings; and whether those ideas do in their formation, any, or all of them, depend on matter or not. These are speculations, which, however curious and entertaining, I shall decline, as lying out of my way, in the design I am now upon. It shall suffice to my present purpose, to consider the discerning faculties of a man, as they are employed about the objects, which they have to do with: and I shall imagine I have not wholly misemployed myself in the thoughts I shall have on this occasion, if, in this historical, plain method, I can give any account of the ways, whereby our understandings come to attain those notions of things we have, and can set down any measures of the certainty of our knowledge, or the grounds of those persuasions, which are to be found amongst men, so various, different, and wholly contradictory; and yet asserted somewhere or other with such assurance, and confidence, that he that shall take a view of the opinions of mankind, observe their opposition,

and at the same time, consider the fondness, and devotion wherewith they are embraced; the resolution and eagerness, wherewith they are maintained, may perhaps have reason to suspect, that either there is no such thing as truth at all; or that mankind hath no sufficient means to attain a certain knowledge of it.

§3. Method. 'tis therefore worth while, to search out the bounds between opinion and knowledge; and examine by what measures, in things, whereof we have no certain knowledge, we ought to regulate our assent, and moderate our persuasion. In order whereunto, I shall pursue this following method.

First, I shall inquire into the original of those ideas, notions, or whatever else you please to call them, which a man observes, and is conscious to himself he has in his mind; and the ways whereby the understanding comes to be furnished with them.

Secondly, I shall endeavour to show, what knowledge the understanding hath by those ideas; and the certainty, evidence, and extent of it.

Thirdly, I shall make some inquiry into the nature and grounds of faith, or opinion; whereby I mean that assent, which we give to any proposition as true, of whose truth yet we have no certain knowledge: and here we shall have occasion to examine the reasons and degrees of assent.

§4. Useful to know the extent of our comprehension. If by this inquiry into the nature of the understanding, I can discover the powers thereof; how far they reach; to what things they are in any degree proportionate; and where they fail us, I suppose it may be of use, to prevail with the busy mind of man to be more cautious in meddling with things exceeding its comprehension; to stop, when 'tis at the utmost extent of its tether; and to sit down in a quiet ignorance of those things, which, upon examination, are found to be beyond the reach of our capacities. We should not then perhaps be so forward, out of an affectation of an universal knowledge, to raise questions, and perplex ourselves and others with disputes about things, to which our understandings are not suited; and of which we cannot frame in our minds any clear or distinct perceptions, or whereof (as it has perhaps too often happened) we have not any notions at all. If we can find out, how far the understanding can extend its view; how far it has faculties

to attain certainty; and in what cases it can only judge and guess, we may learn to content ourselves with what is attainable by us in this state.

§5. Our capacity suited to our state and concerns. For though the comprehension of our understandings, comes exceeding short of the vast extent of things; yet, we shall have cause enough to magnify the bountiful Author of our being, for that proportion and degree of knowledge, he has bestowed on us, so far above all the rest of the inhabitants of this our mansion. Men have reason to be well satisfied with what God hath thought fit for them, since he hath given them (as St Peter says,) Πάντα Πρὸς ζωὴν καὶ εὐσέβειαν *whatsoever is necessary for the conveniences of life, and information of virtue; and has put within the reach of their discovery the comfortable provision for this life and the way that leads to a better.* How short soever their knowledge may come of an universal, or perfect comprehension of whatsoever is, it yet secures their great concernments that they have light enough to lead them to the knowledge of their maker, and the sight of their own duties. Men may find matter sufficient to busy their heads, and employ their hands with variety, delight, and satisfaction; if they will not boldly quarrel with their own constitution, and throw away the blessings their hands are filled with, because they are not big enough to grasp everything. We shall not have much reason to complain of the narrowness of our minds, if we will but employ them about what may be of use to us; for of that they are very capable: And it will be an unpardonable, as well as childish peevishness, if we undervalue the advantages of our knowledge, and neglect to improve it to the ends for which it was given us, because there are some things that are set out of the reach of it. It will be no excuse to an idle and untoward servant, who would not attend his business by candle, light, to plead that he had not broad sunshine. The candle, that is set up in us shines bright enough for all our purposes. The discoveries we can make with this, ought to satisfy us: and we shall then use our understandings right, when we entertain all objects in that way and proportion, that they are suited to our faculties; and upon those grounds, they are capable of being proposed to us; and not peremptorily, or intemperately require demonstration, and demand certainty, where probability only is to be had, and which is sufficient to govern all our concernments. If we will disbelieve everything, because we cannot certainly know all things; we shall do much what as wisely as he, who would not use his legs, but sit still and

perish,because he had no wings to fly.

§6. Knowledge of our capacity a cure of scepticism and idleness.When we know our own strength, we shall the better know what to undertake with hopes of success: and when we have well surveyed the powers of our own minds, and made some estimate what we may expect from them, we shall not be inclined either to sit still, and not set our thoughts on work at all, in despair of knowing anything; nor on the other side, question everything, and disclaim all knowledge,because some things are not to be understood. 'tis of great use to the sailor to know the length of his line, though he cannot with it fathom all the depths of the ocean. 'tis well he knows that 'tis long enough to reach the bottom, at such places, as are necessary to direct his voyage, and caution him against running upon shoals,that may ruin him. Our business here is not to know all things, but those which concern our conduct. If we can find out those measures,whereby a rational creature put in that state, which man is in, in this world, may, and ought to govern his opinions and actions depending thereon, we need not to be troubled, that some other things escape our knowledge.

§7. Occasion of this essay. This was that which gave the first rise to this essay concerning the understanding. For I thought that the first step towards satisfying several inquiries, the mind of man was very apt to run into, was, to take a survey of our own understandings,examine our own powers, and see to what things they were adapted.Till that was done I suspected we began at the wrong end, and in vain sought for satisfaction in a quiet and sure possession of truths,that most concerned us, whilst we let loose our thoughts into the vast ocean of being, as if all that boundless extent, were the natural and undoubted possession of our understandings, wherein there was nothing exempt from its decisions, or that escaped its comprehension. Thus men, extending their inquiries beyond their capacities, and letting their thoughts wander into those depths,where they can find no sure footing; 'tis no wonder that they raise questions, and multiply disputes, which never coming to any clear resolution, are proper only to continue and increase their doubts,and to confirm them at last in perfect scepticism. Whereas, were the capacities of our understandings well considered, the extent of our knowledge once discovered, and the horizon found, which sets the bounds between the enlightened and dark parts of things; between what is and what is not comprehensible by us, men would perhaps with less scruple acquiesce

in the avowed ignorance of the one, and employ their thoughts and discourse, with more advantage and satisfaction in the other.

§8. What idea stands for. Thus much I thought necessary to say concerning the occasion of this inquiry into human understanding. But, before I proceed on to what I have thought on this subject, I must here in the entrance beg pardon of my reader, for the frequent use of the word idea, which he will find in the following treatise. It being that term, which, I think, serves best to stand for whatsoever is the object of the understanding, when a man thinks, I have used it to express whatever is meant by phantasm, notion, species, or whatever 'tis, which the mind can be employed about in thinking; and I could not avoid frequently using it.

I presume it will be easily granted me, that there are such ideas in men's minds; everyone is conscious of them in himself, and men's words and actions will satisfy him, that they are in others.

Our first inquiry then shall be, how they come into the mind.

Chapter II No Innate Principles in the Mind

§1. The way shown how we come by any knowledge, sufficient to prove it not innate. 'tis an established opinion amongst some men, that there are in the understanding certain innate principles; some primary notions, κοινὰ ἔ' ννοῦναι, characters, as it were stamped upon the mind of man, which the soul receives in its very first being; and brings into the world with it. It would be sufficient to convince unprejudiced readers of the falseness of this supposition, if I should only show (as I hope I shall in the following parts of this discourse) how men, barely by the use of their natural faculties, may attain to all the knowledge they have, without the help of any innate impressions; and may arrive at certainty, without any such original notions or principles. For I imagine anyone will easily grant, that it would be impertinent to suppose, the ideas of colours innate in a creature, to whom God hath given sight, and a power to receive them by the eyes, from external objects: and no less unreasonable would it be to attribute several truths, to the impressions of nature, and innate characters, when we may observe in ourselves faculties, fit to attain as easy and certain knowledge of them, as if they were originally imprinted on the mind.

But because a man is not permitted without censure to follow his own thoughts in the search of truth, when they lead him ever so little out of the common road: I shall set down the reasons, that made me doubt of the truth of that opinion, as an excuse for my mistake, if I be in one; which I leave to be considered by those, who, with me, dispose themselves to embrace truth, wherever they find it.

§2. General assent the great argument. There is nothing more commonly taken for granted, than that there are certain principles both speculative and practical (for they speak of both) universally agreed upon by all mankind; which therefore they argue, must needs be the constant impressions, which the souls of men receive in their first beings, and which they bring into the world with them, as necessarily and really as they do any of their inherent faculties.

§3. Universal consent proves nothing innate. This argument, drawn from universal consent, has this misfortune in it, that if it were true in matter of fact, that there were certain truths, wherein all mankind agreed, it would not prove them innate, if there can be any other way shown, how men may come to that universal agreement, in the things they do consent in; which I presume may be done.

§4. 'What is, is,' and 'Tis impossible for the same thing to be and not to be,' not universally assented to. But, which is worse, this argument of universal consent, which is made use of, to prove innate principles, seems to me a demonstration that there are none such: because there are none to which all mankind give an universal assent. I shall begin with the speculative, and instance in those magnified principles of demonstration: 'Whatsoever is, is,' and 'Tis impossible for the same thing to be, and not to be', which, of all others, I think have the most allowed title to innate. These have so settled a reputation of maxims universally received, that it will, no doubt, be thought strange, if anyone should seem to question it. But yet I take liberty to say, that these propositions are so far from having an universal assent, that there are a great part of mankind, to whom they are not so much as known.

§5. Not on the mind naturally imprinted, because not known to children, idiots, etc. For, first 'tis evident, that all children and idiots, have not the least apprehension or thought of them: and the want of that is enough to destroy that universal assent, which must

needs be the necessary concomitant of all innate truths: it seeming to me near a contradiction, to say, that there are truths imprinted on the soul, which it perceives or understands not: Imprinting, if it signify anything, being nothing else, but the making certain truths to be perceived. For to imprint anything on the mind, without the mind's perceiving it, seems to me hardly intelligible. If therefore children and idiots have souls, have minds, with those impressions upon them, they must unavoidably perceive them, and necessarily know and assent to these truths, which since they do not, 'tis evident that there are no such impressions. For if they are not notions naturally imprinted, how can they be innate? And if they are notions imprinted, how can they be unknown? To say a notion is imprinted on the mind, and yet at the same time to say, that the mind is ignorant of it, and never yet took notice of it, is to make this impression nothing. No proposition can be said to be in the mind, which it never yet knew, which it was never yet conscious of. For if any one may; then by the same reason, all propositions that are true, and the mind is capable ever of assenting to, may be said to be in the mind, and to be imprinted: since if any one can be said to be in the mind, which it never yet knew, it must be only because 'tis capable of knowing it; and so the mind is of all truths it ever shall know. Nay, thus truths may be imprinted on the mind, which it never did, nor ever shall know: for a man may live long, and die at last in ignorance of many truths, which his mind was capable of knowing, and that with certainty. So that if the capacity of knowing, be the natural impression contended for, all the truths a man ever comes to know, will, by this account, be every one of them, innate; and this great point will amount to no more, but only to a very improper way of speaking; which whilst it pretends to assert the contrary, says nothing different from those, who deny innate principles. For nobody, I think, ever denied, that the mind was capable of knowing several truths. The capacity they say, is innate, the knowledge acquired. But then to what end such contest for certain innate maxims? If truths can be imprinted on the understanding without being perceived, I can see no difference there can be, between any truths the mind is capable of knowing, in respect of their original: they must all be innate, or all adventitious: in vain shall a man go about to distinguish them. He therefore that talks of innate notions in the understanding, cannot (if he intend thereby any distinct sort of truths) mean such truths to be in the understanding, as it never perceived, and is yet wholly ignorant of. For if these words (to be in the understanding) have any propriety, they signify to be understood.

So that, to be in the understanding, and, not to be understood; to be in the mind, and, never to be perceived, is all one, as to say, anything is, and is not, in the mind or understanding. If therefore these two propositions, 'whatsoever is, is,' and 'tis impossible for the same thing to be, and not to be,' are by nature imprinted, children cannot be ignorant of them: infants, and all that have souls, must necessarily have them in their understandings, know the truth of them, and assent to it.

§6. That men know them when they come to the use of reason, answered. To avoid this, 'tis usually answered, that all men know and assent to them, when they come to the use of reason, and this is enough to prove them innate. I answer,

§7. Doubtful expressions, that have scarce any signification, go for clear reasons, to those, who being prepossessed, take not the pains to examine even what they themselves say. For, to apply this answer with any tolerable sense to our present purpose, it must signify one of these two things; either that, as soon as men come to the use of reason, these supposed native inscriptions come to be known, and observed by them: or else, that the use and exercise of men's reasons assists them in the discovery of these principles, and certainly makes them known to them.

§8. If reason discovered them, that would not prove them innate. If they mean that by the use of reason men may discover these principles; and that this is sufficient to prove them innate; their way of arguing will stand thus, viz. that whatever truths reason can certainly discover to us, and make us firmly assent to, those are all naturally imprinted on the mind; since that universal assent, which is made the mark of them, amounts to no more but this; that by the use of reason, we are capable to come to a certain knowledge of, and assent to them; and, by this means there will be no difference between the maxims of the mathematicians, and theorems they deduce from them: all must be equally allowed innate, they being all discoveries made by the use of reason, and truths that a rational creature may certainly come to know, if he apply his thoughts rightly that way.

§9. 'Tis false that reason discovers them. But how can these men think the use of reason necessary to discover principles that are supposed innate, when reason (if we may believe them) is nothing else, but the faculty of deducing unknown truths from principles or

propositions, that are already known' That certainly can never be thought innate, which we have need of reason to discover, unless as I have said, we will have all the certain truths, that reason ever teaches us, to be innate. We may as well think the use of reason necessary to make our eyes discover visible objects, as that there should be need of reason, or the exercise thereof, to make the understanding see, what is originally engraven on it, and cannot be in the understanding, before it be perceived by it. So that to make reason discover those truths thus imprinted, is to say, that the use of reason discovers to a man, what he knew before; and if men have those innate, impressed truths originally, and before the use of reason, and yet are always ignorant of them, till they come to the use of reason, 'tis in effect to say, that men know, and know them not at the same time.

§10. It will here perhaps be said, that mathematical demonstrations, and other truths, that are not innate, are not assented to, as soon as proposed, wherein they are distinguished from these maxims, and other innate truths. I shall have occasion to speak of assent upon the first proposing, more particularly by and by. I shall here only, and that very readily, allow, that these maxims, and mathematical demonstrations are in this different; that the one have need of reason, using of proofs, to make them out, and to gain our assent; but the other, as soon as understood, are, without any the least reasoning, embraced and assented to. But I withal beg leave to observe, that it lays open the weakness of this subterfuge, which requires the use of reason for the discovery of these general truths: since it must be confessed, that in their discovery, there is no use made of reasoning at all. And I think those who give this answer, will not be forward to affirm, that the knowledge of this maxim, 'that 'tis impossible for the same thing to be, and not to be,' is a deduction of our reason. For this would be to destroy that bounty of nature, they seem so fond of, whilst they make the knowledge of those principles to depend on the labour of our thoughts. For all reasoning is search, and casting about, and requires pains and application. And how can it with any tolerable sense be supposed, that what was imprinted by nature, as the foundation and guide of our reason, should need the use of reason to discover it'

§11. Those who will take the pains to reflect with a little attention on the operations of the understanding, will find that this ready assent of the mind to some truths, depends not, either on native

inscription, or the use of reason; but on a faculty of the mind quite distinct from both of them, as we shall see hereafter. Reason therefore, having nothing to do in procuring our assent to these maxims, if by saying, that men know and assent to them, when they come to the use of reason, be meant, that the use of reason assists us in the knowledge of these maxims, 'tis utterly false; and were it true, would prove them not to be innate.

§12. The coming to the use of reason, not the time we come to know these maxims. If by knowing and assenting to them, when we come to the use of reason, be meant, that this is the time, when they come to be taken notice of by the mind; and that as soon as children come to the use of reason, they come also to know and assent to these maxims; this also is false, and frivolous. First, 'tis false. Because 'tis evident, these maxims are not in the mind so early as the use of reason: and therefore the coming to the use of reason is falsely assigned, as the time of their discovery. How many instances of the use of reason, may we observe in children, a long time before they have any knowledge of this maxim, 'that 'tis impossible for the same thing to be, and not to be' And a great part of illiterate people, and savages, pass many years, even of their rational age, without ever thinking on this, and the like general propositions. I grant men come not to the knowledge of these general and more abstract truths, which are thought innate, till they come to the use of reason; and I add, nor then neither. Which is so, because till after they come to the use of reason, those general abstract ideas are not framed in the mind, about which those general maxims are, which are mistaken for innate principles, but are indeed discoveries made, and verities introduced, and brought into the mind by the same way, and discovered by the same steps, as several other propositions, which nobody was ever so extravagant as to suppose innate. This I hope to make plain in the sequel of this discourse. I allow therefore a necessity, that men should come to the use of reason, before they get the knowledge of those general truths; but deny, that men's coming to the use of reason is the time of their discovery.

§13. By this, they are not distinguished from other knowable truths. In the meantime, 'tis observable, that this saying, that men know, and assent to these maxims, when they come to the use of reason, amounts in reality of fact, to no more but this, that they are never known, nor taken notice of, before the use of reason, but may

possibly be assented to some time after, during a man's life; but when, is uncertain: and so may all other knowable truths, as well as these which therefore have no advantage, nor distinction from others by this note of being known when we come to the use of reason; nor are thereby proved to be innate, but quite the contrary.

§14. If coming to the use of reason were the time of their discovery, it would not prove them innate. But secondly, were it true, that the precise time of their being known, and assented to, were, when men come to the use of reason; neither would that prove them innate. This way of arguing is as frivolous, as the supposition of itself is false. For by what kind of logic will it appear, that any notion is originally by nature imprinted in the mind in its first constitution, because it comes first to be observed, and assented to, when a faculty of the mind, which has quite a distinct province, begins to exert itself. And therefore, the coming to the use of speech, if it were supposed the time, that these maxims are first assented to (which it may be with as much truth, as the time when men come to the use of reason) would be as good a proof that they were innate, as to say, they are innate because men assent to them, when they come to the use of reason. I agree then with these men of innate principles, that there is no knowledge of these general and self-evident maxims in the mind, till it comes to the exercise of reason: but I deny that the coming to the use of reason, is the precise time when they are first taken notice of; and, if that were the precise time, I deny that it would prove them innate. All that can with any truth be meant by this proposition, that men assent to them when they come to the use of reason, is no more but this, that the making of general abstract ideas, and the understanding of general names, being a concomitant of the rational faculty, and growing up with it, children commonly get not those general ideas, nor learn the names that stand for them, till having for a good while exercised their reason about familiar and more particular ideas, they are by their ordinary discourse and actions with others, acknowledged to be capable of rational conversation. If assenting to these maxims, when men come to the use of reason, can be true in any other sense, I desire it may be shown; or at least, how in this, or any other sense it proves them innate.

§15. The steps by which the mind attains several truths. The senses at first let in particular ideas, and furnish the yet empty cabinet: and the mind by degrees growing familiar with some of them,

they are lodged in the memory, and names got to them. Afterwards, the mind proceeding further, abstracts them, and by degrees learns the use of general names. In this manner the mind comes to be furnished with ideas and language, the materials about which to exercise its discursive faculty: and the use of reason becomes daily more visible, as these materials, that give it employment, increase. But though the having of general ideas, and the use of general words and reason usually grow together: yet, I see not, how this any way proves them innate. The knowledge of some truths, I confess, is very early in the mind; but in a way that shows them not to be innate. For, if we will observe, we shall find it still to be about ideas, not innate, but acquired: it being about those first, which are imprinted by external things, with which infants have earliest to do, which make the most frequent impressions on their senses. In ideas thus got, the mind discovers, that some agree, and others differ, probably as soon as it has any use of memory; as soon as 'tis able to retain and receive distinct ideas. But whether it be then, or not, this is certain, it does so long before it has the use of words; or comes to that which we commonly call the use of reason. For a child knows as certainly, before it can speak, the difference between the ideas of sweet and bitter (i.e. that sweet is not bitter) as it knows afterwards (when it comes to speak) that wormwood and sugarplums, are not the same thing.

§16. Assent to supposed innate truths depends on having clear and distinct ideas of what their terms mean, and not on their innateness. A child knows not that three and four are equal to seven, till he comes to be able to count seven, and has got the name and idea of equality: and then upon explaining those words, he presently assents to, or rather perceives the truth of that proposition. But neither does he then readily assent, because 'tis an innate truth, nor was his assent wanting till then, because he wanted the use of reason; but the truth of it appears to him, as soon as he has settled in his mind the clear and distinct ideas, that these names stand for: and then, he knows the truth of that proposition, upon the same grounds, and by the same means, that he knew before, that a rod and a cherry are not the same thing; and upon the same grounds also, that he may come to know afterwards, 'that 'tis impossible for the same thing to be, and not to be,' as shall be more fully shown hereafter. So that the later 'tis before anyone comes to have those general ideas, about which those maxims are; or to know the signification of those general terms, that stand for them; or to put together in his mind, the ideas they stand

for; the later also will it be, before he comes to assent to those maxims, whose terms, with the ideas they stand for, being no more innate, than those of a cat or a weasel, he must stay till time and observation have acquainted him with them; and then he will be in a capacity to know the truth of these maxims, upon the first occasion, that shall make him put together those ideas in his mind, and observe, whether they agree or disagree, according as is expressed in those propositions. And therefore 'tis, that a man knows that eighteen and nineteen, are equal to thirty-seven, by the same self-evidence, that he knows one and two to be equal to three: yet, a child knows this, not so soon as the other; not for want of the use of reason; but because the ideas the words eighteen, nineteen, and thirty-seven stand for, are not so soon got, as those, which are signified by one, two, and three.

§17. Assenting as soon as proposed and understood, proves them not innate. This evasion therefore of general assent, when men come to the use of reason, failing as it does, and leaving no difference between those supposed-innate, and other truths, that are afterwards acquired and learnt, men have endeavoured to secure an universal assent to those they call maxims, by saying, they are generally assented to, as soon as proposed, and the terms they are proposed in, understood: seeing all men, even children, as soon as they hear and understand the terms, assent to these propositions, they think 'tis sufficient to prove them innate. For since men never fail, after they have once understood the words, to acknowledge them for undoubted truths, they would infer, that certainly these propositions were first lodged in the understanding, which, without any teaching, the mind at very first proposal, immediately closes with, and assents to, and after that never doubts again.

§18. If such an assent be a mark of innate, then that one and two are equal to three; that sweetness is not bitterness; and a thousand the like, must be innate. In answer to this, I demand whether ready assent given to a proposition upon first hearing, and understanding the terms, be a certain mark of an innate principle? If it be not, such a general assent is in vain urged as a proof of them; if it be said that 'tis a mark of innate, they must then allow all such propositions to be innate, which are generally assented to, as soon as heard, whereby they will find themselves plentifully stored with innate principles. For upon the same ground viz. of assent at first hearing and understanding the terms, that men would have those maxims pass for innate, they

must also admit several propositions about numbers, to be innate: and thus, 'that one and two are equal to three, that two and two are equal to four', and a multitude of other the like propositions in numbers, that everybody assents to, at first hearing, and understanding the terms, must have a place amongst these innate axioms. Nor is this the prerogative of numbers alone, and propositions made about several of them: but even natural philosophy, and all the other sciences afford propositions, which are sure to meet with assent, as soon as they are understood. 'That two bodies cannot be in the same place' is a truth, that nobody any more sticks at, than at, these maxims, that 'tis impossible for the same thing to be, and not to be'; that 'white is not black'; 'that a square is not a circle'; that bitterness is not sweetness: these, and a million of such other propositions, as many at least, as we have distinct ideas, every man in his wits, at first hearing, and knowing what the names stand for, must necessarily assent to. If these men will be true to their own rule, and have assent at first hearing and understanding the terms, to be a mark of innate, they must allow, not only as many innate propositions, as men have distinct ideas; but as many as men can make propositions wherein different ideas are denied one of another. Since every proposition, wherein one different idea is denied of another, will as certainly find assent at first hearing and understanding the terms, as this general one, 'tis impossible for the same to be, and not to be': or that which is the foundation of it, and is the easier understood of the two, 'the same is not different': by which account, they will have legions of innate propositions of this one sort, without mentioning any other. but since no proposition can be innate, unless the ideas, about which 'tis be innate, this will be to suppose all our ideas of colours, sounds, tastes, figure, etc. innate; than which, there cannot be anything more opposite to reason and experience. Universal and ready assent upon hearing and understanding the terms, is (I grant), a mark of self-evidence: but self-evidence, depending not on innate impressions, but on something else (as we shall show hereafter) belongs to several propositions, which nobody was yet so extravagant, as to pretend to be innate.

§19. Such less general propositions known before these universal maxims. Nor let it be said, that those more particular self-evident propositions, which are assented to at first hearing, as 'that one and two are equal to three'; that green is not red, etc. are received as the consequences of those more universal propositions, which are looked on as innate principles; since anyone, who will but take the pains to

observe what passes in the understanding, will certainly find, that these, and the like less general propositions, are certainly known and firmly assented to, by those, who are utterly ignorant of those more general maxims; and so, being earlier in the mind than those (as they are called) first principles, cannot owe to them the assent, wherewith they are received at first hearing.

§20. 'One and one, equal to two,' etc. not general nor useful, answered. If it be said, that these propositions, viz. 'two and two are equal to four'; 'red is not blue,' etc. are not general maxims, nor of any great use. I answer, that makes nothing to the argument of universal assent, upon hearing and understanding. For, if that be the certain mark of innate, whatever proposition can be found, that receives general assent, as soon as heard and understood, that must be admitted for an innate proposition, as well as this maxim, 'that 'tis impossible for the same thing to be, and not to be,' they being upon this ground equal. And as to the difference of being more general, that makes this maxim more remote from being innate; those general and abstract ideas, being more strangers to our first apprehensions, than those of more particular self-evident propositions; and therefore, 'tis longer before they are admitted and assented to by the growing understanding. And as to the usefulness of these magnified maxims, that perhaps will not be found so great as is generally conceived, when it comes in its due place to be more fully considered.

§21. These maxims not being known sometimes till proposed, proves them not innate. But we have not yet done with assenting to propositions at first hearing and understanding their terms; 'tis fit we first take notice, that this, instead of being a mark, that they are innate, is a proof of the contrary: since it supposes, that several, who understand and know other things, are ignorant of these principles, till they are proposed to them; and that one may be unacquainted with these truths, till he hears them from others. For if they were innate, what need they be proposed, in order to gaining assent when, by being in the understanding, by a natural and original impression (if there were any such) they could not but be known before? Or doth the proposing them, print them clearer in the mind, than nature did? If so, then the consequence will be, that a man knows them better, after he has been thus taught them, than he did before. Whence it will follow, that these principles may be made more evident to us by others' teaching, than nature has made them by impression; which will ill

agree with the opinion of innate principles, and give but little authority to them; but on the contrary, makes them unfit to be the foundations of all our other knowledge, as they are pretended to be. This cannot be denied, that men grow first acquainted with many of these self-evident truths, upon their being proposed: but 'tis clear, that whosoever does so, finds in himself, that he then begins to know a proposition, which he knew not before; and which from thenceforth he never questions; not because it was innate; but because the consideration of the nature of the things contained in those words, would not suffer him to think otherwise, how, or whensoever he is brought to reflect on them. And if whatever is assented to at first hearing, and understanding the terms, must pass for an innate principle, every well-grounded observation drawn from particulars into a general rule, must be innate. When yet 'tis certain, that not all, but only sagacious heads light at first on these observations, and reduce them into general propositions, not innate, but collected from a preceding acquaintance, and reflection on particular instances. These, when observing men have made them, unobserving men, when they are proposed to them, cannot refuse their assent to.

§22. Implicitly known before proposing, signifies that the mind is capable of understanding them, or else signifies nothing. If it be said, the understanding hath an implicit knowledge of these principles, but not an explicit, before this first hearing, (as they must, who will say, that they are in the understanding before they are known) it will be hard to conceive what is meant by a principle imprinted on the understanding implicitly; unless it be this, that the mind is capable of understanding and assenting firmly to such propositions. And thus all mathematical demonstrations, as well as first principles, must be received as native impressions on the mind: which I fear they will scarce allow them to be, who find it harder to demonstrate a proposition, than assent to it, when demonstrated. And few mathematicians, will be forward to believe, that all the diagrams they have drawn, were but copies of those innate characters, which nature had engraven upon their minds.

§23. The argument of assenting on first hearing, is upon a false supposition of no precedent teaching. There is, I fear, this further weakness in the foregoing argument, which would persuade us, that therefore those maxims are to be thought innate, which men admit at first hearing, because they assent to propositions, which they are not

taught, nor do receive from the force of any argument or demonstration, but a bare explication or understanding of the terms. Under which, there seems to me to lie this fallacy; that men are supposed not to be taught, nor to learn anything de novo; when in truth, they are taught, and do learn something they were ignorant of before. For first, 'tis evident, they have learned the terms and their signification; neither of which was born with them. But this is not all the acquired knowledge in the case: the ideas themselves, about which the proposition is, are not born with them, no more than their names, but got afterwards. So that in all propositions that are assented to, at first hearing; the terms of the proposition, their standing for such ideas, and the ideas themselves that they stand for, being neither of them innate, I would fain know what there is remaining in such propositions, that is innate. For I would gladly have anyone name that proposition, whose terms or ideas were either of them innate. We by degrees get ideas and names, and learn their appropriated connexion one with another; and then to propositions, made in such terms, whose signification we have learnt, and wherein the agreement or disagreement we can perceive in our ideas, when put together, is expressed, we at first hearing assent; though to other propositions, in themselves as certain and evident, but which are concerning ideas, not so soon or so easily got, we are at the same time no way capable of assenting. For though a child quickly assents to this proposition, 'that an apple is not fire'; when by familiar acquaintance, he has got the ideas of those two different things distinctly imprinted on his mind, and has learnt that the names apple and fire stand for them; yet it will be some years after, perhaps, before the same child will assent to this proposition, 'that 'tis impossible for the same thing to be, and not to be'. Because, that though, perhaps, the words are as easy to be learnt; yet the signification of them, being more large, comprehensive, and abstract, than of the names annexed to those sensible things, the child hath to do with; 'tis longer before he learns their precise meaning, and it requires more time plainly to form in his mind those general ideas, they stand for. Till that be done, you will in vain endeavour to make any child assent to a proposition, made up of such general terms: but as soon as ever he has got those ideas, and learned their names, he forwardly closes with the one, as well as the other of the forementioned propositions; and with both for the same reason; viz. because he finds the ideas he has in his mind, to agree or disagree, according as the words standing for them, are affirmed, or denied one of another in the proposition. But if propositions be brought to him in

words, which stand for ideas he has not yet in his mind; to such propositions, however evidently true or false in themselves, he affords neither assent nor dissent, but is ignorant. For words being but empty sounds, any further than they are signs of our ideas, we cannot but assent to them as they correspond to those ideas we have, but no further than that. But the showing by what steps and ways knowledge comes into our minds, and grounds of several degrees of assent, being the business of the following discourse, it may suffice to have only touched on it here, as one reason, that made me doubt of those innate principles.

§24. Not innate, because not universally assented to. To conclude this argument of universal consent, I agree with these defenders of innate principles, that if they are innate, they must needs have universal assent. For that a truth should be innate, and yet not assented to, is to me as unintelligible, as for a man to know a truth, and be ignorant of it at the same time. But then, by these men's own confession, they cannot be innate; since they are not assented to, by those who understand not the terms, nor by a great part of those who do understand them, but have yet never heard, nor thought of those propositions; which, I think, is at least one half of mankind. But were the number far less, it would be enough to destroy universal assent, and thereby show these propositions not to be innate, if children alone were ignorant of them.

§25. These maxims not the first known. But that I may not be accused, to argue from the thoughts of infants, which are unknown to us, and to conclude, from what passes in their understandings, before they express it; I say next, that these two general propositions are not the truths, that first possess the minds of children; nor are antecedent to all acquired, and adventitious notions: which if they were innate, they must needs be. Whether we can determine it or no, it matters not, there is certainly a time, when children begin to think, and their words and actions do assure us, that they do so. When therefore they are capable of thought, of knowledge, of assent, can it rationally be supposed, they can be ignorant of those notions that nature has imprinted, were there any such? Can it be imagined, with any appearance of reason, that they perceive the impressions from things without; and be at the same time ignorant of those characters, which nature, itself has taken care to stamp within? Can they receive and assent to adventitious notions, and be ignorant of those, which are

supposed woven into the very principles of their being, and imprinted there in indelible characters, to be the foundation and guide of all their acquired knowledge, and future reasonings' This would be, to make nature take pains to no purpose; or, at least, to write very ill; since its characters could not be read by those eyes, which saw other things very well; and those are very ill supposed the clearest parts of truth, and the foundations of all our knowledge, which are not first known, and without which, the undoubted knowledge of several other things may be had. The child certainly knows, that the nurse that feeds it, is neither the cat it plays with, nor the blackmoor 'tis afraid of; that the wormseed or mustard it refuses, is not the apple or sugar it cries for; this 'tis certainly and undoubtedly assured of: but will anyone say, 'tis by virtue of this principle, 'that 'tis impossible for the same thing to be, and not to be,' that it so firmly assents to these, and other parts of its knowledge' Or that the child has any notion or apprehension of that proposition at an age, wherein yet 'tis plain, it knows a great many other truths' He that will say, children join these general abstract speculations with their sucking-bottles, and their rattles, may, perhaps, with justice be thought to have more passion and zeal for his opinion; but less sincerity and truth, than one of that age.

§26. And so not innate. Though therefore there be several general propositions, that meet with constant and ready assent, as soon as proposed to men grown up, who have attained the use of more general and abstract ideas, and names standing for them; yet they not being to be found in those of tender years, who nevertheless know other things, they cannot pretend to universal assent of intelligent persons, and so by no means can be supposed innate: it being impossible, that any truth which is innate (if there were any such) should be unknown, at least to anyone, who knows anything else. Since, if they are innate truths, they must be innate thoughts; there being nothing a truth in the mind, that it has never thought on. Whereby 'tis evident, if there be any innate truths, they must necessarily be the first of any thought on; the first that appear there.

§27. Not innate, because they appear least, where what is innate shows itself clearest. That the general maxims, we are discoursing of, are not known to children, idiots, and a great part of mankind, we have already sufficiently proved; whereby 'tis evident, they have not an universal assent, nor are general impressions. But there is this further argument in it, against their being innate: that these

characters, if they were native and original impressions, should appear fairest and clearest in those persons, in whom yet we find no footsteps of them: and 'tis, in my opinion, a strong presumption, that they are not innate, since they are least known to those, in whom, if they were innate, they must needs exert themselves with most force and vigour. For children, idiots, savages, and illiterate people, being of all others the least corrupted by custom, or borrowed opinions; learning, and education, having not cast their native thoughts into new moulds; nor by superinducing foreign and studied doctrines confounded those fair characters nature had written there; one might reasonably imagine, that in their minds these innate notions should lie open fairly to everyone's view, as 'tis certain the thoughts of children do. It might very well be expected, that these principles should be perfectly known to naturals; which being stamped immediately on the soul (as these men suppose) can have no dependence on the constitution, or organs of the body, the only confessed difference between them and others. One would think, according to these men's principles, that all these native beams of light (were there any such) should in those, who have no reserves, no arts of concealment, shine out in their full lustre, and leave us in no more doubt of their being there, than we are of their love of pleasure, and abhorrence of pain. But alas, amongst children, idiots, savages, and the grossly illiterate, what general maxims are to be found? What universal principles of knowledge? Their notions are few and narrow, borrowed only from those objects, they have had most to do with, and which have made upon their senses the frequentest and strongest impressions. A child knows his nurse and his cradle, and by degrees the playthings of a little more advanced age: and a young savage has, perhaps, his head filled with love and hunting, according to the fashion of his tribe. But he that from a child untaught, or a wild inhabitant of the woods, will expect these abstract maxims and reputed principles of science, will I fear, find himself mistaken. Such kind of general propositions, are seldom mentioned in the huts of Indians; much less are they to be found in the thoughts of children, or any impressions of them on the minds of naturals. They are the language and business of the schools, and academies of learned nations, accustomed to that sort of conversation, or learning, where disputes are frequent: these maxims being suited to artificial argumentation, and useful for conviction; but not much conducing to the discovery of truth, or advancement of knowledge. But of their small use for the improvement of knowledge, I shall have occasion to speak more at large, l. 4, c. 7.

§28. Recapitulation. I know not how absurd this may seem to the masters of demonstration: and probably, it will hardly go down with anybody at first hearing. I must therefore beg a little truce with prejudice, and the forbearance of censure, till I have been heard out in the sequel of this discourse, being very willing to submit to better judgments. And since I impartially search after truth, I shall not be sorry to be convinced that I have been too fond of my own notions; which I confess we are all apt to be, when application and study have warmed our heads with them. Upon the whole matter, I cannot see any ground, to think these two famed speculative maxims innate: since they are not universally assented to; and the assent they so generally find, is no other, than what several propositions, not allowed to be innate, equally partake in with them: and since the assent that is given them, is produced another way, and comes not from natural inscription, as I doubt not but to make appear in the following discourse. And if these first principles of knowledge and science are found not to be innate, no other speculative maxims can (I suppose) with better right pretend to be so.

Chapter III No Innate Practical Principles

§1. No moral principles so clear and so generally received, as the forementioned speculative maxims. If those speculative maxims, whereof we discoursed in the foregoing chapter, have not an actual universal assent from all mankind, as we there proved, 'tis much more visible concerning practical principles, that they come short of an universal reception: and I think it will be hard to instance any one moral rule, which can pretend to so general and ready an assent as, 'What is, is', or to be so manifest a truth as this, 'that 'tis impossible for the same thing to be, and not to be.' Whereby 'tis evident, that they are further removed from a title to be innate; and the doubt of their being native impressions on the mind, is stronger against those moral principles than the other. Not that it brings their truth at all in question. They are equally true, though not equally evident. Those speculative maxims carry their own evidence with them: but moral principles require reasoning and discourse, and some exercise of the mind, to discover the certainty of their truth. They lie not open as natural characters engraven on the mind; which, if any such were, they must needs be visible by themselves, and by their own light be certain and known to everybody. But this is no derogation to their truth and

certainly, no more than 'tis to the truth or certainty of the three angles of a triangle being equal to two right ones, because 'tis not so evident, as 'the whole is bigger than a part'; nor so apt to be assented to at first hearing. It may suffice, that these moral rules are capable of demonstration: and therefore 'tis our own faults, if we come not to a certain knowledge of them. But the ignorance wherein many men are of them, and the slowness of assent, wherewith others receive them, are manifest proofs, that they are not innate, and such as offer themselves to their view without searching.

§2. Faith and justice not owned as principles by all men. Whether there be any such moral principles, wherein all men do agree, I appeal to any, who have been but moderately conversant in the history of mankind, and looked abroad beyond the smoke of their own chimneys. Where is that practical truth, that is universally received without doubt or question, as it must be if innate? Justice, and keeping of contracts, is that which most men seem to agree in. This is a principle, which is thought to extend itself to the dens of thieves, and the confederacies of the greatest villains; and they who have gone furthest towards the putting off of humanity itself, keep faith and rules of justice one with another. I grant that outlaws themselves do this one amongst another; but 'tis without receiving these as the innate laws of nature. They practise them as rules of convenience within their own communities: but 'tis impossible to conceive, that he embraces justice as a practical principle, who acts fairly with his fellow highwayman, and at the same time plunders or kills the next honest man he meets with. Justice and truth are the common ties of society; and therefore, even outlaws and robbers, who break with all the world besides, must keep faith and rules of equity amongst themselves, or else they cannot hold together. But will anyone say, that those that live by fraud or rapine, have innate principles of truth and justice which they allow and assent to?

§3. Objection. Though men deny them in their practice, yet they admit them in their thoughts, answered. Perhaps it will be urged, that the tacit assent of their minds agrees to what their practice contradicts. I answer, first, I have always thought the actions of men the best interpreters of their thoughts. But since 'tis certain, that most men's practices, and some men's open professions, have either questioned or denied these principles, 'tis impossible to establish an universal consent (though we should look for it only amongst grown

men) without which, 'tis impossible to conclude them innate. Secondly, 'tis very strange and unreasonable, to suppose innate practical principles, that terminate only in contemplation. Practical principles derived from nature, are there for operation, and must produce conformity of action, not barely speculative assent to their truth, or else they are in vain distinguished from speculative maxims. Nature, I confess, has put into man a desire of happiness, and an aversion to misery: these indeed are innate practical principles, which (as practical principles ought) do continue constantly to operate and influence all our actions, without ceasing: these may be observed in all persons and all ages, steady and universal; but these are inclinations of the appetite to good, not impressions of truth on the understanding. I deny not that there are natural tendencies imprinted on the minds of men; and that, from the very first instances of sense and perception, there are some things, that are grateful, and others unwelcome to them; some things that they incline to, and others that they fly: but this makes nothing for innate characters on the mind, which are to be the principles of knowledge, regulating our practice. Such natural impressions on the understanding, are so far from being confirmed hereby, that this is an argument against them; since if there were certain characters, imprinted by nature on the understanding, as the principles of knowledge, we could not but perceive them constantly operate in us, and influence our knowledge, as we do those others on the will and appetite; which never cease to be the constant springs and motives of all our actions, to which, we perpetually feel them strongly impelling us.

§4. Moral rules need a proof, ergo not innate. Another reason that makes me doubt of any innate practical principles, is, that I think, there cannot any one moral rule be proposed, whereof a man may not justly demand a reason: which would be perfectly ridiculous and absurd, if they were innate, or so much as self-evident; which every innate principle must needs be, and not need any proof to ascertain its truth, nor want any reason to gain it approbation. He would be thought void of common sense, who asked on the one side, or on the other side, went to give a reason 'why 'tis impossible for the same thing to be, and not to be.' It carries its own light and evidence with it, and needs no other proof: he that understands the terms, assents to it for its own sake, or else nothing will ever be able to prevail with him to do it. But should that most unshaken rule of morality, and foundation of all social virtue, 'that one should do as he would be

done unto,' be proposed to one, who never heard of it before, but yet is of capacity to understand its meaning; might he not without any absurdity ask a reason why? And were not he that proposed it, bound to make out the truth and reasonableness of it to him? Which plainly shows it not to be innate; for if it were, it could neither want nor receive any proof; but must needs (at least as soon as heard and understood) be received and assented to, as an unquestionable truth, which a man can by no means doubt of. So that the truth of all these moral rules, plainly depends upon some other antecedent to them, and from which they must be deduced, which could not be, if either they were innate, or so much as self-evident.

§5. Instance in keeping compacts. That men should keep their compacts, is certainly a great and undeniable rule in morality: but yet, if a Christian, who has the view of happiness and misery in another life, be asked why a man must keep his word, he will give this as a reason: because God, who has the power of eternal life and death, requires it of us. But if a Hobbist be asked why; he will answer, because the public requires it, and the Leviathan will punish you, if you do not. And if one of the old heathen philosophers had been asked, he would have answered: because it was dishonest, below the dignity of a man, and opposite to virtue, the highest perfection of human nature, to do otherwise.

§6. Virtue generally approved, not because innate, but because profitable. Hence naturally flows the great variety of opinions, concerning moral rules, which are to be found amongst men, according to the different sorts of happiness, they have a prospect of, or propose to themselves: which could not be, if practical principles were innate, and imprinted in our minds immediately by the hand of God. I grant the existence of God, is so many ways manifest, and the obedience we owe him, so congruous to the light of reason, that a great part of mankind give testimony to the law of nature: But yet I think it must be allowed, that several moral rules, may receive from mankind, a very general approbation, without either knowing, or admitting the true ground of morality; which can only be the will and law of a God, who sees men in the dark, has in his hand rewards and punishments, and power enough to call to account the proudest offender. For God, having, by an inseparable connexion, joined virtue and public happiness together; and made the practice thereof, necessary to the preservation of society, and visibly beneficial to all,

with whom the virtuous man has to do; 'tis no wonder, that everyone should, not only allow, but recommend, and magnify those rules to others, from whose observance of them, he is sure to reap advantage to himself. He may, out of interest, as well as conviction, cry up that for sacred; which if once trampled on, and profaned, he himself cannot be safe nor secure. This, though it takes nothing from the moral and eternal obligation, which these rules evidently have; yet it shows that the outward acknowledgment men pay to them in their words, proves not that they are innate principles: nay, it proves not so much, as, that men assent to them inwardly in their own minds, as the inviolable rules of their own practice: since we find that self-interest and the conveniences of this life, make many men, own an outward profession and approbation of them, whose actions sufficiently prove, that they very little consider the law-giver, that prescribed these rules; nor the hell he has ordained for the punishment of those that transgress them.

§7. Men's actions convince us, that the rule of virtue is not their internal principle. For, if we will not in civility allow too much sincerity to the professions of most men, but think their actions to be the interpreters of their thoughts, we shall find, that they have no such internal veneration for these rules, nor so full a persuasion of their certainty and obligation. The great principle of morality, 'To do as one would be done to,' is more commended, than practised. But the breach of this rule cannot be a greater vice, than to teach others, that 'tis no moral rule, nor obligatory, would be thought madness, and contrary to that interest men sacrifice to, when they break it themselves. Perhaps conscience will be urged as checking us for such breaches, and so the internal obligation and establishment of the rule be preserved.

§8. Conscience no proof of any innate moral rule. To which, I answer, that I doubt not, but without being written on their hearts, many men, may, by the same way that they come to the knowledge of other things, come to assent to several moral rules, and be convinced of their obligation. Others also may come to be of the same mind, from their education, company, and customs of their country; which persuasion, however got, will serve to set conscience on work, which is nothing else, but our own opinion or judgment of the moral rectitude or pravity of our own actions. And if conscience be a proof of innate principles, contraries may be innate principles: since some men, with the same bent of conscience, prosecute what

others avoid.

§9. Instances of enormities practised without remorse. But I cannot see how any men, should ever transgress those moral rules, with confidence, and serenity, were they innate, and stamped upon their minds. View but an army at the sacking of a town, and see what observation, or sense of moral principles, or what touch of conscience, for all the outrages they do. Robberies, murders, rapes, are the sports of men set at liberty from punishment and censure. Have there not been whole nations, and those of the most civilized people, amongst whom, the exposing their children, and leaving them in the fields, to perish by want or wild beasts, has been the practice, as little condemned or scrupled, as the begetting them? Do they not still, in some countries, put them into the same graves with their mothers, if they die in child-birth; or despatch them, if a pretended astrologer declares them to have unhappy stars? And are there not places, where at a certain age, they kill, or expose their parents without any remorse at all? In a part of Asia, the sick, when their case comes to be thought desperate, are carried out and laid on the earth, before they are dead; and left there, exposed to wind and weather, to perish without assistance or pity. 'Tis familiar amongst the Mingrelians, a people professing Christianity, to bury their children alive without scruple. There are places where they eat their own children. The Caribees were wont to geld their children, on purpose to fat and eat them. And Garcilasso de la Vega tells us of a people in Peru, which were wont to fat and eat the children they got on their female captives, whom they kept as concubines for that purpose; and when they were past breeding, the mothers themselves were killed too and eaten. The virtues, whereby the Tououpinambos believed they merited paradise, were revenge, and eating abundance of their enemies. They have not so much as a name for God, and have no religion, no worship. The saints, who are canonized amongst the Turks, lead lives, which one cannot with modesty relate. A remarkable passage to this purpose, out of the Voyage of Baumgarten, which is a book, not every day to be met with, I shall set down at large, in the language 'tis published in. 'Ibi (sc. prope Belbes in Aegypto) vidimus sanctum unum Saracenicum inter arenarum cumulos, ita ut ex utero matris prodiit nudum sedentem. Mos est, ut didicimus, Mahometistis, ut eos qui amentes et sine ratione sunt, pro sanctis colant et venerentur. Insuper et eos qui cum diu vitam egerint inquinatissimam, voluntariam demum poenitentiam et paupertatem, sanctitate venerandos deputant.

Ejusmodi verò genus hominum libertatem quandam effr'nem habent, domos quos volunt intrandi, edendi, bibendi, et quod majus est, concumbendi; ex quo concubitu, si proles secuta fuerit, sancta similiter habetur. His ergo hominibus dum vivunt, magnos exhibent honores; mortuis verò vel templa vel monumenta extruunt amplissima, eosque contingere ac sepelire maximae fortun' ducunt loco. Audivimus h'c dicta et dicenda per interpretem à Mucrelo nostro. Insuper sanctum illum, quem eo loco vidimus, publicitus apprimè commendari, eum esse Hominem sanctum, divinum ac integritate praecipuum; eo quod, nec f'minarum unquam esset, nec puerorum, sed tantummodo asellarum concubitor atque mularum. '(Peregr. Baumgarten, 1. 2. c. I, p. 73). More of the same kind, concerning these precious saints amongst the Turks, may be seen in Pietro della Valle, in his letter of the 25th of January, 1616. Where then are those innate principles, of justice, piety, gratitude, equity, chastity? Or, where is that universal consent, that assures us there are such inbred rules? Murders in duels, when fashion has made them honourable, are committed without remorse of conscience: nay, in many places, innocence in this case is the greatest ignominy. And if we look abroad, to take a view of men, as they are, we shall find, that they have remorse in one place, for doing or omitting that, which others, in another place, think they merit by.

§10. Men have contrary practical principles. He that will carefully peruse the history of mankind, and look abroad into the several tribes of men, and with indifferency survey their actions, will be able to satisfy himself, that there is scarce that principle of morality to be named, or rule of virtue to be thought on (those only excepted, that are absolutely necessary to hold society together, which commonly too are neglected betwixt distinct societies) which is not, somewhere or other, slighted and condemned by the general fashion of whole societies of men, governed by practical opinions, and rules of living quite opposite to others.

§11. Whole nations reject several moral rules. Here, perhaps, it will be objected, that 'tis no argument, that the rule is not known, because 'tis broken. I grant the objection good, where men, though they transgress, yet disown not the law; where fear of shame, censure, or punishment, carries the mark of some awe it has upon them. But 'tis impossible to conceive, that a whole nation of men should all publicly reject and renounce, what every one of them, certainly and

infallibly, knew to be a law: for so they must, who have it naturally imprinted on their minds. 'Tis possible, men may sometimes own rules of morality, which, in their private thoughts, they do not believe to be true, only to keep themselves in reputation, and esteem amongst those, who are persuaded of their obligation. But 'tis not to be imagined, that a whole society of men, should publicly and professedly, disown and cast off a rule, which they could not, in their own minds, but be infallibly certain, was a law; nor be ignorant, that all men, they should have to do with, knew it to be such: and therefore must every one of them apprehend from others, all the contempt and abhorrence due to one, who professes himself void of humanity; and one, who confounding the known and natural measures of right and wrong, cannot but be looked on, as the professed enemy of their peace and happiness. Whatever practical principle is innate, cannot but be known to everyone, to be just and good. 'Tis therefore little less than a contradiction, to suppose, that whole nations of men should both in their professions, and practice, unanimously and universally give the lie to what, by the most invincible evidence, every one of them knew to be true, right, and good. This is enough to satisfy us, that no practical rule, which is anywhere universally, and with public approbation, or allowance, transgressed, can be supposed innate. But I have something further to add, in answer to this objection.

§12. The generally allowed breach of a rule, proof that 'tis not innate. The breaking of a rule, say you, is no argument that 'tis unknown. I grant it: but the generally allowed breach of it anywhere, I say, is a proof, that 'tis not innate. For example, let us take any of these rules, which being the most obvious deductions of human reason, and conformable to the natural inclination of the greatest part of men, fewest people have had the impudence to deny, or inconsideration to doubt of. If any can be thought to be naturally imprinted, none, I think, can have a fairer pretence to be innate, than this; 'parents, preserve and cherish your children.' When therefore you say, that this is an innate rule, what do you mean? Either, that 'tis an innate principle which upon all occasions, excites and directs the actions of all men: or else, that 'tis a truth, which all men have imprinted on their minds, and which therefore they know, and assent to. But in neither of these senses is it innate. First, that 'tis not a principle, which influences all men's actions, is, what I have proved by the examples before cited: nor need we seek so far as Mingrelia or

Peru, to find instances of such as neglect, abuse, nay, and destroy their children; or look on it only as the more than brutality of some savage and barbarous nations, when we remember, that it was a familiar, and uncondemned practice amongst the Greeks and Romans, to expose, without pity or remorse, their innocent infants. Secondly, that 'tis an innate truth, known to all men, is also false. For, 'parents preserve your children,' is so far from an innate truth, that 'tis no truth at all; it being a command, and not a proposition, and so not capable of truth or falsehood. To make it capable of being assented to as true, it must be reduced to some such proposition as this: 'tis the duty of parents to preserve their children.' But what duty is, cannot be understood without a law; nor a law be known, or supposed without a law-maker, or without reward and punishment: so that 'tis impossible that this, or any other practical principle should be innate; i.e. be imprinted on the mind as a duty, without supposing the ideas of God, of law, of obligation, of punishment, of a life after this, innate. For, that punishment follows not, in this life, the breach of this rule; and consequently, that it has not the force of a law in countries, where the generally allowed practice runs counter to it, is in itself evident. But these ideas (which must be all of them innate, if anything as a duty be so) are so far from being innate, that 'tis not every studious or thinking man, much less every one that is born, in whom they are to be found clear and distinct: and that one of them, which of all others seems most likely to be innate, is not so, (I mean the idea of God) I think, in the next chapter, will appear very evident to any considering man.

§13. If men can be ignorant of what is innate, certainty is not described by innate principles. From what has been said, I think we may safely conclude, That, whatever practical rule is, in any place, generally, and with allowance, broken, cannot be supposed innate, it being impossible, that men should, without shame or fear, confidently, and serenely break a rule, which they could not but evidently know, that God had set up, and would certainly punish the breach of (which they must, if it were innate) to a degree to make it a very ill bargain to the transgressor. Without such a knowledge as this, a man can never be certain, that anything is his duty. Ignorance or doubt of the law; hopes to escape the knowledge or power of the law-maker, or the like, may make men give way to a present appetite: but let anyone see the fault, and the rod by it, and with the transgression, a fire ready to punish it; a pleasure tempting, and the hand of the

Almighty visibly held up, and prepared to take vengeance (for this must be the case, where any duty is imprinted on the mind) and then tell me, whether it be possible, for people, with such a prospect, such a certain knowledge as this, wantonly, and without scruple, to offend against a law, which they carry about them in indelible characters, and that stares them in the face, whilst they are breaking it' Whether men, at the same time that they feel in themselves the imprinted edicts of an omnipotent law-maker, can, with assurance and gaiety, slight and trample underfoot his most sacred injunctions' And lastly, whether it be possible, that whilst a man thus openly bids defiance to this innate law, and supreme lawgiver, all the bystanders; yea, even the governors and rulers of the people, full of the same sense, both of the law and law-maker, should silently connive without testifying their dislike, or laying the least blame on it' Principles of actions indeed, there are lodged in men's appetites, but these are so far from being innate moral principles, that if they were left to their full swing, they would carry men to the overturning of all morality. Moral laws are set as a curb and restraint to these exorbitant desires, which they cannot be but by rewards and punishments, that will over-balance the satisfaction anyone shall propose to himself in the breach of the law. If therefore anything be imprinted on the mind of all men as a law, all men must have a certain and unavoidable knowledge, that certain, and unavoidable punishment will attend the breach of it. For if men can be ignorant or doubtful of what is innate, innate principles are insisted on, and urged, to no purpose; truth and certainty (the things pretended) are not at all secured by them: but men are in the same uncertain, floating estate with, as without them. An evident indubitable knowledge of unavoidable punishment, great enough to make the transgression very uneligible, must accompany an innate law: unless with an innate law, they can suppose an innate gospel too. I would not here be mistaken, as if, because I deny an innate law, I thought there were none but positive laws. There is a great deal of difference between an innate law, and a law of nature; between something imprinted on our minds in their very original, and something that we being ignorant of, may attain to the knowledge of, by the use and due application of our natural faculties. And I think they equally forsake the truth, who running into contrary extremes, either affirm an innate law, or deny that there is a law, knowable by the light of nature; i.e. without the help of positive revelation.

§14. Those who maintain innate practical principles, tell us not

what they are. The difference there is amongst men in their practical principles, is so evident, that, I think, I need say no more to evince, that it will be impossible to find any innate moral rules, by this mark of general assent: And 'tis enough to make one suspect, that the supposition of such innate principles, is but an opinion taken up at pleasure; since those who talk so confidently of them, are so sparing to tell us, which they are. This might with justice be expected from those men, who lay stress upon this opinion: and it gives occasion to distrust either their knowledge or charity, who declaring, that God has imprinted on the minds of men, the foundations of knowledge, and the rules of living, are yet so little favourable to the information of their neighbours, or the quiet of mankind, as not to point out to them, which they are, in the variety men are distracted with. But in truth, were there any such innate principles, there would be no need to teach them. Did men find such innate propositions stamped on their minds, they would easily be able to distinguish them from other truths, that they afterwards learned, and deduced from them; and there would be nothing more easy, than to know what, and how many they were. There could be no more doubt about their number, than there is about the number of our fingers; and 'tis like then, every system would be ready to give them us by tale. But since nobody, that I know, has ventured yet to give a catalogue of them, they cannot blame those who doubt of these innate principles; since even they who require men to believe, that there are such innate propositions, do not tell us what they are. 'Tis easy to foresee, that if different men of different sects should go about to give us a list of those innate practical principles, they would set down only such as suited their distinct hypotheses, and were fit to support the doctrines of their particular schools or churches: a plain evidence, that there are no such innate truths. Nay, a great part of men are so far from finding any such innate moral principles in themselves, that by denying freedom to mankind; and thereby making men no other than bare machines, they take away not only innate, but all moral rules whatsoever, and leave not a possibility to believe any such, to those who cannot conceive, how anything can be capable of a law that is not a free agent: and upon that ground, they must necessarily reject all principles of virtue, who cannot put morality and mechanism together, which are not very easy to be reconciled, or made consistent.

§15. Lord Herbert's innate principles examined. When I had writ this, being informed, that my Lord Herbert had in his book de

Veritate, assigned these innate principles, I presently consulted him, hoping to find, in a man of so great parts, something that might satisfy me in this point, and put an end to my inquiry. In his chapter ‘de Instinctu naturali,’ p. 76, edit. 1656, I met with these six marks of his *notitiae communes*, 1. *Prioritas*. 2. *Independentia*. 3. *Universalitas*. 4. *Certitudo*. 5. *Necessitas*, i.e. as he explains it, *faciunt ad hominis conservationem*. 6. *Modus conformationis*, i.e. *Assensus nullà interposità morà*. And at the latter end of his little treatise, *De Religione Laici*, he says this of these innate principles: ‘*Adeo ut non uniuscujusvis Religionis confinio arctentur quae ubique vigent veritates. Sunt enim in ipsà mente caelitùs descriptae nullisque traditionibus, sive scriptis, sive non scriptis, obnoxii*’ (p. 3). And ‘*Veritates nostrae catholicae, quae tanquam indubia Dei emata in foro interiori descriptae.*’ Thus having given the marks of the innate principles or common notions, and asserted their being imprinted on the minds of men by the hand of God, he proceeds to set them down; and they are these: 1. *Esse aliquod supremum numen*. 2. *Numen illud coli debere*. 3. *Virtutem cum pietate conjunctam optimam esse rationem cultus divini*. 4. *Resipiscendum esse à peccatis*. 5. *Dari praemium vel paenam post hanc vitam transactam*. Though I allow these to be clear truths, and such as, if rightly explained, a rational creature can hardly avoid giving his assent to: yet I think he is far from proving them innate impressions in *foro interiori descriptae*. For I must take leave to observe,

§16. First, that these five propositions are either not all, or more than all, those common notions writ on our minds by the finger of God, if it were reasonable to believe any at all to be so written. Since there are other propositions, which even by his own rules, have as just a pretence to such an original, and may be as well admitted for innate principles, as at least, some of these five he enumerates, viz. ‘do as thou wouldst be done unto’: and, perhaps, some hundreds of others, when well considered.

§17. Secondly, that all his marks are not to be found in each of his five propositions, viz. his first, second, and third marks agree perfectly to neither of them; and the first, second, third, fourth, and sixth marks, agree but ill to his third, fourth, and fifth propositions. For, besides that, we are assured from history, of many men, nay whole nations, who doubt or disbelieve some or all of them; I cannot see how the third, viz. ‘that virtue joined with piety, is the

best worship of God,' can be an innate principle, when the name, or sound virtue, is so hard to be understood; liable to so much uncertainty in its signification; and the thing it stands for, so much contended about, and difficult to be known. And therefore this cannot be but a very uncertain rule of human practice, and serve but very little to the conduct of our lives, and is therefore very unfit to be assigned as an innate practical principle.

§18. For let us consider this proposition as to its meaning, (for 'tis the sense, and not sound, that is, and must be the principle or common notion) viz. 'virtue is the best worship of God,' i.e. is most acceptable to him; which if virtue be taken, as most commonly 'tis, for those actions, which according to the different opinions of several countries, are accounted laudable, will be a proposition so far from being certain, that it will not be true. If virtue be taken for actions conformable to God's will, or to the rule prescribed by God, which is the true and only measure of virtue, when virtue is used to signify what is in its own nature right and good; then this proposition, 'that virtue is the best worship of God,' will be most true and certain, but of very little use in human life: since it will amount to no more but this, viz. 'that God is pleased with the doing of what he commands'; which a man may certainly know to be true, without knowing what 'tis, that God doth command; and so be as far from any rule or principle of his actions, as he was before: and I think very few will take a proposition which amounts to no more than this, viz. that God is pleased with the doing of what he himself commands, for an innate moral principle writ on the minds of all men, (however true and certain it may be) since it teaches so little. Whosoever does so, will have reason to think hundreds of propositions, innate principles, since there are many, which have as good a title, as this, to be received for such, which nobody yet ever put into that rank of innate principles.

§19. Nor is the fourth proposition viz. 'men must repent of their sins' much more instructive, till what those actions are, that are meant by sins, be set down. For the word peccata, or sins, being put, as it usually is, to signify in general ill actions, that will draw punishment upon the doers: what great principle of morality can that be, to tell us we should be sorry, and cease to do that, which will bring mischief upon us, without knowing what those particular actions are, that will do so? Indeed, this is a very true proposition, and fit to be incited on, and received by those, who are supposed, to have been taught, what

actions in all kinds are sins; but neither this, nor the former, can be imagined to be innate principles; nor to be of any use, if they were innate, unless the particular measures and bounds of all virtues and vices were engraven in men's minds, and were innate principles also, which, I think, is very much to be doubted. And therefore, I imagine, it will scarcely seem possible, that God should engrave principles in men's minds, in words of uncertain signification, such as virtues and sins, which amongst different men, stand for different things: nay, it cannot be supposed to be in words at all, which, being in most of these principles very general names, cannot be understood, but by knowing the particulars comprehended under them. And in the practical instances, the measures must be taken from the knowledge of the actions themselves, and the rules of them abstracted from words, and antecedent to the knowledge of names; which rules a man must know, what language soever he chance to learn, whether English or Japan, or if he should learn no language at all, or never should understand the use of words, as happens in the case of dumb and deaf men. When it shall be made out, that men ignorant of words, or untaught by the laws and customs of their country, know that 'tis part of the worship of God, not to kill another man; not to know more women than one; not to procure abortion; not to expose their children; not to take from another what is his, though we want it ourselves, but on the contrary, relieve and supply his wants; and whenever we have done the contrary, we ought to repent, be sorry, and resolve to do so no more: when, I say, all men shall be proved actually to know, and allow all these and a thousand other such rules, all which come under these two general words made use of above, viz. *virtutes et peccata*, virtues and sins, there will be more reason for admitting these, and the like, for common notions and practical principles; yet after all, universal consent (were there any in moral principles) to truths, the knowledge whereof may be attained otherwise, would scarce prove them to be innate; which is all I contend for.

§20. Objection. Innate principles may be corrupted, answered. Nor will it be of much moment here, to offer that very ready, but not very material answer, viz. That the innate principles of morality, may, by education, and custom, and the general opinion of those, amongst whom we converse, be darkened, and at last quite worn out of the minds of men. Which assertion of theirs, if true, quite takes away the argument of universal consent, by which this opinion of innate

principles is endeavoured to be proved; unless those men will think it reasonable, that their private persuasions, or that of their party, should pass for universal consent; a thing not unfrequently done, when men presuming themselves to be the only masters of right reason, cast by the votes and opinions of the rest of mankind, as not worthy the reckoning. And then their argument stands thus: the principles which all mankind allow for true, are innate; those that men of right reason admit, are the principles allowed by all mankind; we and those of our mind, are men of reason; therefore we agreeing, our principles are innate: which is a very pretty way of arguing, and a short cut to infallibility. For otherwise it will be very hard to understand, how there be some principles, which all men do acknowledge, and agree in; and yet there are none of those principles, which are not by depraved custom, and ill education, blotted out of the minds of many men: which is to say, that all men admit, but yet many men do deny, and dissent from them. And indeed the supposition of such first principles, will serve us to very little purpose; and we shall be as much at a loss with, as without them, if they may by any human power, such as the will of our teachers, or opinions of our companions, be altered or lost in us: and notwithstanding all this boast of first principles, and innate light, we shall be as much in the dark and uncertainty, as if there were no such thing at all: it being all one to have no rule, and one that will warp any way; or amongst various and contrary rules, not to know which is the right. But concerning innate principles, I desire these men to say, whether they can, or cannot, by education and custom, be blurred and blotted out: if they cannot, we must find them in all mankind alike, and they must be clear in everybody: and if they may suffer variation from adventitious notions, we must then find them clearest and most perspicuous, nearest the fountain, in children and illiterate people, who have received least impression from foreign opinions. Let them take which side they please, they will certainly find it inconsistent with visible matter of fact, and daily observation.

§21. Contrary principles in the world. I easily grant, that there are great numbers of opinions which, by men of different countries, educations, and tempers, are received and embraced as first and unquestionable principles; many whereof, both for their absurdity, as well as oppositions to one another, 'tis impossible should be true. But yet all those propositions, how remote soever from reason, are so sacred somewhere or other, that men even of good

understanding in other matters, will sooner part with their lives, and whatever is dearest to them, than suffer themselves to doubt, or others to question, the truth of them.

§22. How men commonly come by their principles. This, however strange it may seem, is that which every day's experience confirms; and will not, perhaps, appear so wonderful, if we consider the ways, and steps by which 'tis brought about; and how really it may come to pass, that doctrines, that have been derived from no better original, than the superstition of a nurse, or the authority of an old woman; may, by length of time, and consent of neighbours, grow up to the dignity of principles in religion or morality. For such, who are careful (as they call it) to principle children well, (and few there be who have not a set of those principles for them, which they believe in) instil into the unwary, and, as yet, unprejudiced understanding, (for white paper receives any characters) those doctrines they would have them retain and profess. These being taught them as soon as they have any apprehension; and still as they grow up, confirmed to them, either by the open profession, or tacit consent, of all they have to do with; or at least by those of whose wisdom, knowledge, and piety, they have an opinion, who never suffer those propositions to be otherwise mentioned, but as the basis and foundation, on which they build their religion and manners, come, by these means to have the reputation of unquestionable, self-evident, and innate truths.

§23. Principles supposed innate because we do not remember when we began to hold them. To which we may add, that when men, so instructed, are grown up, and reflect on their own minds, they cannot find anything more ancient there, than those opinions, which were taught them, before their memory began to keep a register of their actions, or date the time, when any new thing appeared to them; and therefore make no scruple to conclude, that those propositions, of whose knowledge they can find in themselves no original, were certainly the impress of God and nature upon their minds: and not taught them by anyone else. These they entertain and submit to, as many do to their parents, with veneration; not because 'tis natural; nor do children do it, where they are not so taught; but because, having been always so educated, and having no remembrance of the beginning of this respect, they think 'tis natural.

§24. How such principles come to be held. This will appear very

likely, and almost unavoidable to come to pass, if we consider the nature of mankind, and the constitution of human affairs; wherein most men cannot live, without employing their time in the daily labours of their callings; nor be at quiet in their minds, without some foundation or principle to rest their thoughts on. There is scarcely anyone so floating and superficial in his understanding, who hath not some revered propositions, which are to him the principles on which he bottoms his reasonings; and by which he judgeth of truth and falsehood, right and wrong; which some, wanting skill and leisure, and others the inclination, and some being taught, that they ought not, to examine; there are few to be found, who are not exposed by their ignorance, laziness, education, or precipitancy, to take them upon trust.

§25. Further explained. This is evidently the case of all children and young folk; and custom, a greater power than nature, seldom failing to make them worship for divine, what she hath inured them to bow their minds, and submit their understandings to, 'tis no wonder, that grown men, either perplexed in the necessary affairs of life, or hot in the pursuit of pleasures, should not seriously sit down to examine their own tenets; especially when one of their principles is, that principles ought not to be questioned. And had men leisure, parts, and will, who is there almost, that dare shake the foundations of all his past thoughts and actions, and endure to bring upon himself, the shame of having been a long time wholly in mistake and error? Who is there, hardy enough to contend with the reproach, which is everywhere prepared for those, who dare venture to dissent from the received opinions of their country or party? And where is the man to be found, that can patiently prepare himself to bear the name of whimsical, sceptical, or atheist, which he is sure to meet with, who does in the least scruple any of the common opinions? And he will be much more afraid to question those principles, when he shall think them, as most men do, the standards set up by God in his mind, to be the rule and touchstone of all other opinions. And what can hinder him from thinking them sacred, when he finds them the earliest of all his own thoughts, and the most revered by others?

§26. A worship of idols. 'Tis easy to imagine, how by these means it comes to pass, that men worship the idols that have been set up in their minds; grow fond of the notions they have been long acquainted with there; and stamp the characters of divinity, upon absurdities and

errors, become zealous votaries to bulls and monkeys; and contend too, fight, and die in defence of their opinions. 'Dum solos credit habendos esse Deos, quos ipse colit.' For since the reasoning faculties of the soul, which are almost constantly, though not always warily nor wisely employed, would not know how to move, for want of a foundation and footing, in most men, who through laziness or avocation, do not; or for want of time, or true helps, or for other causes, cannot, penetrate into the principles of knowledge, and trace truth to its fountain and original, 'tis natural for them, and almost unavoidable, to take up with some borrowed principles; which being reputed and presumed to be the evident proofs of other things, are thought not to need any other proof themselves. Whoever shall receive any of these into his mind, and entertain them there, with the reverence usually paid to principles, never venturing to examine them; but accustoming himself to believe them, because they are to be believed, may take up from his education, and the fashions of his country, any absurdity for innate principles; and by long poring on the same objects, so dim his sight, as to take monsters lodged in his own brain, for the images of the Deity, and the workmanship of his hands.

§27. Principles must be examined. By this progress, how many there are, who arrive at principles, which they believe innate, may be easily observed, in the variety of opposite principles, held, and contended for, by all sorts and degrees of men. And he that shall deny this to be the method, wherein most men proceed to the assurance they have, of the truth and evidence of their principles, will perhaps, find it a hard matter, any other way to account for the contrary tenets, which are firmly believed, confidently asserted, and which great numbers are ready at any time to seal with their blood. And, indeed, if it be the privilege of innate principles, to be received upon their own authority, without examination, I know not what may not be believed, or how any one's principles can be questioned. If they may and ought to be examined, and tried, I desire to know how first and innate principles can be tried; or at least 'tis reasonable to demand the marks and characters, whereby the genuine, innate principles, may be distinguished from others; that so, amidst the great variety of pretenders, I may be kept from mistakes, in so material a point as this. When this is done, I shall be ready to embrace such welcome, and useful propositions; and till then I may with modesty doubt, since I fear universal consent, which is the only one produced, will scarcely prove a sufficient mark to direct my choice, and assure me of any

innate principles. From what has been said, I think it past doubt, that there are no practical principles wherein all men agree; and therefore none innate.

Chapter IV Other Considerations concerning Innate Principles, both Speculative and Practical

§1. Principles not innate, unless their ideas be innate. Had those, who would persuade us, that there are innate principles, not taken them together in gross; but considered, separately, the parts, out of which those propositions are made, they would not, perhaps, have been so forward to believe they were innate. Since, if the ideas, which made up those truths were not, it was impossible, that the propositions, made up of them, should be innate, or our knowledge of them be born with us. For if the ideas be not innate, there was a time when the mind was without those principles; and then, they will not be innate, but be derived from some other original. For, where the ideas themselves are not, there can be no knowledge, no assent, no mental, or verbal propositions about them.

§2. Ideas, especially those belonging to principles, not born with children. If we will attentively consider new-born children, we shall have little reason to think, that they bring many ideas into the world with them. For, bating, perhaps, some faint ideas, of hunger, and thirst, and warmth, and some pains, which they may have felt in the womb, there is not the least appearance of any settled ideas at all in them; especially of ideas, answering the terms, which make up those universal propositions, that are esteemed innate principles. One may perceive how, by degrees, afterwards, ideas come into their minds; and that they get no more, nor no other, than what experience, and the observation of things, that come in their way, furnish them with; which might be enough to satisfy us, that they are not original characters, stamped on the mind.

§3. ‘Impossibility’ and ‘identity’ not innate ideas. ‘Tis impossible for the same thing to be, and not to be’, is certainly (if there be any such) an innate principle. But can anyone think, or will anyone say, that impossibility and identity are two innate ideas? Are they such as all mankind have, and bring into the world with them? And are they those, that are the first in children, and antecedent to all acquired ones? If they are innate, they must needs be so. Hath a child an idea of

impossibility and identity, before it has of white or black; sweet or bitter' And is it from the knowledge of this principle, that it concludes, that wormwood rubbed on the nipple hath not the same taste, that it used to receive from thence' Is it the actual knowledge of 'impossible est idem esse, et non esse', that makes a child distinguish between its mother and a stranger; or, that makes it fond of the one, and fly the other' Or does the mind regulate itself, and its assent by ideas, that it never yet had' Or the understanding draw conclusions from principles, which it never yet knew or understood' The names impossibility and identity, stand for two ideas, so far from being innate, or born with us, that I think it requires great care and attention, to form them right in our understandings. They are so far from being brought into the world with us; so remote from the thoughts of infancy and childhood, that, I believe, upon examination, it will be found, that many grown men want them.

§4. Identity, an idea not innate. If identity (to instance in that alone) be a native impression; and consequently so clear and obvious to us, that we must needs know it even from our cradles; I would gladly be resolved, by one of seven, or seventy years old, whether a man, being a creature, consisting of soul and body, be the same man, when his body is changed' Whether Euphorbus and Pythagoras, having had the same soul, were the same men, though they lived several ages asunder' Nay, whether the cock too, which had the Other Considerations concerning Innate Principles, both Speculative and Practical same soul, were not the same with both of them' Whereby, perhaps, it will appear, that our idea of sameness, is not so settled and clear, as to deserve to be thought innate in us. For if those innate ideas, are not clear and distinct, so as to be universally known, and naturally agreed on, they cannot be subjects of universal, and undoubted truths; but will be the unavoidable occasion of perpetual uncertainty. For, I suppose everyone's idea of identity, will not be the same, that Pythagoras, and thousands others of his followers, have: and which then shall be the true' Which innate' Or are there two different ideas of identity, both innate'

§5. What makes the same man' Nor let any one think, that the questions, I have here proposed, about the identity of man, are bare, empty speculations; which if they were, would be enough to show, that there was in the understandings of men no innate idea of identity. He, that shall, with a little attention, reflect on the

resurrection, and consider, that divine justice will bring to judgment, at the last day, the very same persons, to be happy or miserable in the other, who did well or ill in this life, will find it perhaps, not easy to resolve with himself, what makes the same man, or wherein identity consists: and will not be forward to think he, and everyone, even children themselves, have naturally a clear idea of it.

§6. Whole and part, not innate ideas. Let us examine that principle of mathematics, viz. 'that the whole is bigger than a part'. This, I take it, is reckoned amongst innate principles. I am sure it has as good a title, as any, to be thought so; which yet, nobody can think it to be, when he considers the ideas it comprehends in it, whole and part, are perfectly relative; but the positive ideas, to which they properly and immediately belong, are extension and number, of which alone, whole and part, are relations. So that if whole and part are innate ideas, extension and number must be so too; it being impossible to have an idea of a relation, without having any at all of the thing to which it belongs, and in which 'tis founded. Now, whether the minds of men have naturally imprinted on them the ideas of extension and number, I leave to be considered by those, who are the patrons of innate principles.

§7. Idea of worship not innate. That 'God is to be worshipped', is, without doubt, as great a truth as any that can enter into the mind of man, and deserves the first place amongst all practical principles. But yet, it can by no means be thought innate, unless the ideas of God, and worship, are innate. That the idea, the term worship stands for, is not in the understanding of children, and a character stamped on the mind in its first original, I think, will be easily granted, by anyone, that considers how few there be, amongst grown men, who have a clear and distinct notion of it. And, I suppose, there cannot be anything more ridiculous, than to say, that children have this practical principle innate, 'that God is to be worshipped'; and yet, that they know not what that worship of God is, which is their duty. But to pass by this.

§8. Idea of God not innate. If any idea can be imagined innate, the idea of God may, of all others, for many reasons, be thought so; since 'tis hard to conceive, how there should be innate moral principles, without an innate idea of a Deity: Without a notion of a lawmaker, 'tis impossible to have a notion of a law, and an obligation

to observe it. Besides the atheists, taken notice of amongst the ancients, and left branded upon the records of history, hath not navigation discovered, in these later ages, whole nations, at the bay of Soldania in Brasil, in Boranday, and the Caribee Islands, etc. amongst whom there was to be found no notion of a God, no religion. Nicholaus del Techo in literis, ex Paraquaria de Caaiguarum conversione, has these words: 'Reperi eam gentem nullum nomen habere, quod Deum, et Hominis animam significet, nulla sacra habet, nulla idola.' These are instances of nations where uncultivated nature has been left to itself, without the help of letters, and discipline, and the improvements of arts and sciences. But there are others to be found, who have enjoyed Other Considerations concerning Innate Principles, both Speculative and Practical these in a very great measure, who yet, for want of a due application of their thoughts this way, want the idea, and knowledge of God. 'Twill, I doubt, not be a surprise to others, as it was to me, to find the Siamites of this number. But for this, let them consult the King of France's late envoy thither, who gives no better account of the Chinese themselves. And if we will not believe La Loubere, the missionaries of China, even the Jesuits themselves, the great encomiasts of the Chinese, do all to a man agree and will convince us that the sect of the litterari, or learned, keeping to the old religion of China, and the ruling party there, are all of them atheist. Vid. Navarette in the Collection of Voyages, vol. and Historia cultus Sinensium. And, perhaps, if we should, with attention, mind the lives, and discourses of people not so far off, we should have too much reason to fear, that many, in more civilized countries, have no very strong, and clear impressions of a deity upon their minds; and that the complaints of atheism, made from the pulpit, are not without reason. And though only some profligate wretches own it too barefacedly now; yet, perhaps, we should hear, more than we do, of it, from others, did not the fear of the magistrate's sword, or their neighbour's censure, tie up people's tongues; which, were the apprehensions of punishment, or shame taken away, would as openly proclaim their atheism, as their lives do.

§9. The name of God not universal or obscure in meaning. But had all mankind, everywhere, a notion of a God, (whereof yet history tells us the contrary) it would not from thence follow, that the idea of him was innate. For, though no nation were to be found without a name, and some few dark notions of him; yet that would not prove them to be natural impressions on the mind, no more than the names

of fire, or the sun, heat, or number, do prove the ideas they stand for, to be innate, because the names of those things, and the ideas of them, are so universally received, and known amongst mankind. Nor on the contrary, is the want of such a name, or the absence of such a notion out of men's minds, any argument against the being of a God, any more, than it would be a proof, that there was no loadstone in the world, because a great part of mankind, had neither a notion of any such thing, nor a name for it; or be any show of argument to prove, that there are no distinct and various species of angels, or intelligent beings above us, because we have no ideas of such distinct species, or names for them: for men being furnished with words, by the common language of their own countries, can scarce avoid having some kind of ideas of those things, whose names, those they converse with, have occasion frequently to mention to them; and if it carries with it the notion of excellency, greatness, or something extraordinary; if apprehension and concernment accompany it; if the fear of absolute and irresistible power set it upon the mind, the idea is likely to sink the deeper, and spread the further; especially if it be such an idea, as is agreeable to the common light of reason, and naturally deducible from every part of our knowledge, as that of a God is. For the visible marks of extraordinary wisdom and power, appear so plainly in all the works of the creation, that a rational creature, who will but seriously reflect on them, cannot miss the discovery of a Deity: and the influence, that the discovery of such a being must necessarily have on the minds of all, that have but once heard of 'tis so great, and carries such a weight of thought and communication with it, that it seems stranger to me, that a whole nation of men should be anywhere found so brutish, as to want the notion of a God; than that they should be without any notion of numbers, or fire.

§10. Ideas of God and idea of fire. The name of God being once mentioned in any part of the world, to express a superior, powerful, wise, invisible Being, the suitableness of such a notion to the principles of common reason, and the interest men will always have to mention it often, must necessarily spread it far and wide; and continue it down to all generations: though yet the general reception of this name, and some imperfect and unsteady notions conveyed thereby, Other Considerations concerning Innate Principles, both Speculative and Practical to the unthinking part of mankind, prove not the idea to be innate; but only that they, who made the discovery, had

made a right use of their reason, thought maturely of the causes of things, and traced them to their original; from whom other less considering people, having once received so important a notion, it could not easily be lost again.

§11. Idea of God not innate. This is all could be inferred from the notion of a God, were it to be found universally in all the tribes of mankind, and generally acknowledged, by men grown to maturity in all countries. For the generality of the acknowledging of a God, as I imagine, is extended no further than that; which if it be sufficient to prove the idea of God, innate, will as well prove the idea of fire, innate; since, I think, it may truly be said, that there is not a person in the world, who has a notion of a God, who has not also the idea of fire. I doubt not, but if a colony of young children should be placed in an island, where no fire was, they would certainly neither have any notion of such a thing, nor name for it, how generally soever it were received, and known in all the world besides; and perhaps too, their apprehensions would be as far removed from any name, or notion of a God, till some one amongst them had employed his thoughts, to inquire into the constitution and causes of things, which would easily lead him to the notion of a God; which having once taught to others, reason, and the natural propensity of their own thoughts, would afterwards propagate, and continue amongst them.

§12. Suitable to God's goodness, that all men should have an idea of Him, therefore naturally imprinted by Him; answered. Indeed 'tis urged, that 'tis suitable to the goodness of God, to imprint, upon the minds of men, characters and notions of himself, and not to leave them in the dark, and doubt, in so grand a concernment; and also by that means, to secure to himself the homage and veneration, due from so intelligent a creature as man; and therefore he has done it. This argument, if it be of any force, will prove much more than those, who use it in this case, expect from it. For if we may conclude, that God hath done for men, all that men shall judge is best for them, because 'tis suitable to his goodness so to do, it will prove, not only, that God has imprinted on the minds of men an idea of himself; but that he hath plainly stamped there, in fair characters, all that men ought to know, or believe of him; all that they ought to do in obedience to his will; and that he hath given them a will and affections conformable to it. This, no doubt, everyone will think it better for men, than that they should, in the dark, grope after knowledge, as St Paul tells us all

nations did after God, Acts XVII. 27, than that their wills should clash with their understandings, and their appetites cross their duty. The Romanists say, 'tis best for men, and so suitable to the goodness of God, that there should be an infallible judge of controversies on earth; and therefore there is one: and I, by the same reason, say 'tis better for men that every man himself should be infallible. I leave them to consider, whether by the force of this argument they shall think, that every man is so. I think it a very good argument, to say, the infinitely wise God hath made it so: and therefore 'tis best. But it seems to me a little too much confidence of our own wisdom, to say, I think it best, and therefore God hath made it so. and in the matter in hand, it will be in vain to argue from such a topic, that God hath done so, when certain experience shows us, that he hath not. But the goodness of God hath not been wanting to men without such original impressions of knowledge, or ideas stamped on the mind: since he hath furnished man with those faculties, which will serve for the sufficient discovery of all things requisite to the end of such a being; and I doubt not but to show that a man by the right use of his natural abilities, may, without any innate principles, attain a knowledge of a God, and other things that concern him. God having endued man with those faculties of knowing which he hath, was no more obliged by his goodness, to implant those innate notions in his mind, than that having given him reason, hands, and materials, he

Other Considerations concerning
Innate Principles, both Speculative and Practical should build him
bridge or houses, which some people in the world, however of good
parts, do either totally want, or are but ill provided of, as well as
others are wholly without ideas of God, and principles of morality; or
at least have but very ill ones. The reason in both cases being, that
they never employed their parts, faculties, and powers, industriously
that way, but contented themselves with the opinions, fashions, and
things, of their country, as they found them, without looking any
further. Had you or I been born at the Bay of Soldania, possibly our
thoughts, and notions, had not exceeded those brutish ones of the
Hottentots that inhabit there: and had the Virginia king Apochancana,
been educated in England, he had, perhaps been as knowing a divine,
and as good a mathematician, as any in it. The difference between
him, and a more improved Englishman, lying barely in this, that
exercise of his faculties was bounded within the ways, modes, and
notions of his own country, and never directed to any other, or further
inquiries: and if he had not any idea of a God, it was only because he
pursued not those thoughts, that would have led him to it.

§13. Ideas of God various in different men. I grant, that if there were any ideas to be found imprinted on the minds of men, we have reason to expect, it should be the notion of his Maker, as a mark God set on his own workmanship, to mind man of his dependence and duty; and that herein should appear the first instances of human knowledge. But how late is it before any such notion is discoverable in children? And when we find it there, how much more does it resemble the opinion, and notion of the teacher, than represent the true God? He that shall observe in children, the progress whereby their minds attain the knowledge they have, will think, that the objects they do first, and most familiarly converse with, are those that make the first impressions on their understandings: nor will he find the least footsteps of any other. 'Tis easy to take notice, how their thoughts enlarge themselves, only as they come to be acquainted with a greater variety of sensible objects, to retain the ideas of them in their memories; and to get the skill to compound and enlarge them, and several ways put them together. How by these means they come to frame in their minds an idea men have of a deity, I shall hereafter show.

§14. Contrary and inconsistent ideas of God under the same name. Can it be thought that the ideas men have of God, are the characters, and marks of himself, engraven in their minds by his own finger, when we see, that in the same country, under one and the same name, men have far different, nay, often contrary and inconsistent ideas and conceptions of him? Their agreeing in a name, or sound, will scarce prove an innate notion of him.

§15. Gross ideas of God. What true or tolerable notion of a deity could they have, who acknowledged, and worshipped hundreds? Every deity, that they owned above one, was an infallible evidence of their ignorance of Him, and a proof, that they had no true notion of God, where unity, infinity, and eternity, were excluded. To which if we add their gross conceptions of corporeity, expressed in their images, and representations of their deities; the amours, marriages, copulations, lusts, quarrels, and other mean qualities, attributed by them to their gods; we shall have little reason to think, that the heathen world, i.e. the greatest part of mankind, had such ideas of God in their minds, as he himself, out of care, that they should not be mistaken about him, was author of. And this universality of consent, so much argued, if it prove any native

impressions, it will be only this: that God imprinted on the minds of all men, speaking the same language, a name for himself, but not any idea: since those people, who agreed in the name, had at the same time, far different apprehensions about the thing signified. If they say, that the variety of deities worshipped by the heathen world, were but figurative ways of expressing the several attributes of that incomprehensible Being, or several parts of his providence: I answer, what they might be in Other Considerations concerning Innate Principles, both Speculative and Practical their original, I will not here inquire; but that they were so in the thoughts of the vulgar, I think nobody will affirm: and he that will consult the voyage of the Bishop of Beryte, c. 13. (not to mention other testimonies) will find, that the theology of the Siamites, professedly owns a plurality of gods: or, as the Abbé de Choisy more judiciously remarks, in his *Journal du Voyage de Siam*, 107/ 177, it consists properly in acknowledging no God at all.

§16. Idea of God not innate although wise men of all nations come to have it. If it be said, that wise men of all nations came to have true conceptions of the unity and infinity of the Deity, I grant it. But then this.

First, excludes universality of consent in anything, but the name, for those wise men being very few, perhaps one of a thousand, this universality is very narrow.

Secondly, it seems to me plainly to prove, that the truest and best notions men have of God, were not imprinted, but acquired by thought and meditation, and a right use of their faculties: since the wise and considerate men of the world, by a right and careful employment of their thoughts and reason, attained true notions in this, as well as other things; whilst the lazy and inconsiderate part of men, making far the greater number, took up their notions, by chance, from common tradition and vulgar conceptions, without much beating their heads about them. And if it be a reason to think the notion of God innate, because all wise men had it, virtue too must be thought innate; for that also wise men have always had.

§17. Odd, low, and pitiful ideas of God common among men. This was evidently the case of all Gentilism: nor hath even amongst Jews, Christians, and Mahometans, who acknowledged but one God, this doctrine, and the care is taken in those nations to teach men, to have

true notions of a God, prevailed so far, as to make men to have the same, and the true ideas of Him. How many, even amongst us, will be found upon inquiry, to fancy him in the shape of a man, sitting in heaven; and to have many other absurd and unfit conceptions of him? Christians, as well as Turks, have had whole sects owning, and contending earnestly for it, that the Deity was corporeal, and of human shape: and though we find few amongst us, who profess themselves anthropomorphites, (though some I have met with, that own it) yet, I believe, he that will make it his business, may find amongst the ignorant, and uninstructed Christians, many of that opinion. Talk but with country-people, almost of any age; or young people, almost of any condition, and you shall find, that though the name of God be frequently in their mouths; yet the notions they apply this name to, are so odd, low, and pitiful, that nobody can imagine, they were taught by a rational man; much less, that they were characters writ by the finger of God Himself. Nor do I see how it derogates more from the goodness of God, that he has given us minds unfurnished with these ideas of Himself, than that he hath sent us into the world, with bodies unclothed; and that there is no art or skill born with us. For being fitted with faculties to attain these, 'tis want of industry, and consideration in us, and not of bounty in Him, if we have them not. 'Tis as certain, that there is a God, as that the opposite angles, made by the intersection of two straight lines, are equal. There was never any rational creature, that set himself sincerely to examine the truth of these propositions, that could fail to assent to them: though yet be past doubt, that there are many men, who having not applied their thoughts that way, are ignorant both of the one and the other. If anyone think fit to call this (which is the utmost of its extent) universal consent, such an one I easily allow: but such an universal consent as this, proves not the idea of God, no more than it does the idea of such angles, innate.

§18. If the idea of God be not innate, no other can be supposed innate. Since then though the knowledge of a God, be the most natural discovery of human reason, yet the idea of him, is not innate, as, I think, is evident from what has been said; I imagine there will be scarce any other idea found, that can pretend to it: since if God Other Considerations concerning Innate Principles, both Speculative and Practical had set any impression, any character on the understanding of men, 'tis most reasonable to expect it should have been some clear and uniform idea of Himself, as far as our weak capacities were

capable to receive so incomprehensible and infinite an object. But our minds being, at first, void of that idea, which we are most concerned to have, 'tis a strong presumption against all other innate characters. I must own, as far as I can observe, I can find none, and would be glad to be informed by any other.

§19. Idea of substance not innate. I confess, there is another idea which would be of general use for mankind to have, as 'tis of general talk, as if they had it; and that is the idea of substance, which we neither have, nor can have, by sensation or reflection. If nature took care to provide us any ideas, we might well expect it should be such, as by our own faculties we cannot procure to ourselves: but we see on the contrary, that since by those ways, whereby other ideas are brought into our minds, this is not, we have no such clear idea at all, and therefore signify nothing by the word substance, but only an uncertain supposition of we know not what (i.e. of something whereof we have no particular distinct positive) idea, which we take to be the substratum, or support, of those ideas we do know.

§20. No propositions can be innate, since no ideas are innate. Whatever then we talk of innate, either speculative, or practical principles, it may, with as much probability, be said, that a man hath 100 l. sterling in his pocket, and yet denied, that he hath either penny, shilling, crown, or any other coin, out of which the sum is to be made up; as to think, that certain propositions are innate when the ideas about which they are, can by no means be supposed to be so. The general reception and assent that is given, doth not at all prove, that the ideas expressed in them, are innate: for in many cases, however the ideas came there, the assent to words expressing the agreement, or disagreement, of such ideas, will necessarily follow. Everyone that hath a true idea of God and worship, will assent to this proposition, that God is to be worshipped, when expressed, in a language he understands: and every rational man, that hath not thought on it today, may be ready to assent to this proposition tomorrow; and yet millions of men may be well supposed to want one, or both, those ideas today. For if we will allow savages, and most country-people, to have ideas of God and worship, (which conversation with them, will not make one forward to believe) yet I think few children can be supposed, to have those ideas which therefore they must begin to have sometime or other; and then they will also begin to assent to that proposition, and make very little question of it ever after. But such an

assent upon hearing, no more proves the ideas to be innate, than it does, that one born blind (with cataracts, which will be couched tomorrow) had the innate ideas of the sun, or light, or saffron, or yellow; because, when his sight is cleared, he will certainly assent to this proposition, that the Sun is lucid, or that saffron is yellow: and therefore if such an assent upon hearing, cannot prove the ideas innate, it can much less the propositions made up of those ideas. If they have any innate ideas, I would be glad to be told, what, and how many they are.

§21. No innate ideas in the memory. To which let me add: if there be any innate ideas, any ideas in the mind, which the mind does not actually think on; they must be lodged in the memory, and from thence must be brought into view by remembrance; i.e. must be known, when they are remembered, to have been perceptions in the mind before, unless remembrance can be without remembrance. For to remember, is to perceive anything with memory, or with a consciousness, that it was known or perceived before: without this, whatever idea comes into the mind is new, and not remembered: this consciousness of its having been in the mind before, being that which distinguishes remembering from all other ways of thinking. Whatever idea was never perceived by the mind, was never in the mind. Whatever idea is in the mind, is, either an actual perception, Other Considerations concerning Innate Principles, both Speculative and Practical or else having been an actual perception, is so in the mind, that by the memory it can be made an actual perception again. Whenever there is the actual perception of any idea without memory, the idea appears perfectly new and unknown before to the understanding. Whenever the memory brings any idea into actual view, 'tis with a consciousness, that it had been there before, and was not wholly a stranger to the mind. Whether this be not so, I appeal to every one's observation: and then I desire an instance of an idea, pretended to be innate, which (before any impression of it by ways hereafter to be mentioned) anyone could revive and remember as an idea, he had formerly known; without which consciousness of a former perception, there is no remembrance; and whatever idea comes into the mind without that consciousness, is not remembered, or comes not out of the memory, nor can be said to be in the mind before that appearance. For what is not either actually in view, or in the memory, is in the mind no way at all, and is all one as if it never had been there. Suppose a child had the use of his eyes till he knows and

distinguishes colours; but then cataracts shut the windows, and he is forty or fifty years perfectly in the dark; and in that time perfectly loses all memory of the ideas of colours, he once had. This was the case of a blind man I once talked with, who lost his sight by the smallpox, when he was a child, and had no more notion of colours, than one born blind. I ask whether anyone can say this man had then any ideas of colours in his mind, any more than one born blind? And I think nobody will say, that either of them had in his mind any ideas of colours at all. His cataracts are couched, and then he has the ideas (which he remembers not) of colours, *de novo*, by his restored sight, conveyed to his mind, and that without any consciousness of a former acquaintance. And these now he can revive, and call to mind in the dark. In this case all these ideas of colours, which when out of view can be revived with a consciousness of a former acquaintance, being thus in the memory, are said to be in the mind. The use I make of this is, that whatever idea being not actually in view, is in the mind, is there only by being in the memory; and if it be not in the memory, 'tis not in the mind; and if it be in the memory, it cannot by the memory be brought into actual view, without a perception that it comes out of the memory, which is this, that it had been known before, and is now remembered. If therefore there be any innate ideas, they must be in the memory, or else nowhere in the mind; and if they be in the memory, they can be revived without any impression from without, and whenever they are brought into the mind, they are remembered, i.e. they bring with them a perception of their not being wholly new to it. This being a constant, and distinguishing difference between what is, and what is not in the memory, or in the mind; that what is not in the memory, whenever it appears there, appears perfectly new, and unknown before; and what is in the memory, or in the mind, whenever 'tis suggested by the memory, appears not to be new, but the mind finds it in itself, and knows it was there before. By this it may be tried, whether there be any innate ideas in the mind before impression from sensation or reflection. I would fain meet with the man, who when he came to the use of reason, or at any other time, remembered any of them: and to whom, after he was born, they were never new. If any one will say, there are ideas in the mind, that are not in the memory, I desire him to explain himself, and make what he says intelligible.

§22. Principles not innate, because of little use, or little certainty. Besides what I have already said, there is another reason,

why I doubt, that neither these, nor any other principles are innate. I that am fully persuaded, that the infinitely, wise God made all things in perfect wisdom, cannot satisfy myself why he should be supposed to print upon the minds of men some universal principles; whereof those that are pretended innate, and concern speculation, are of no great use; and those that concern practice, not self-evident; and neither of them distinguishable from some other truths, not allowed to be innate. Other Considerations concerning Innate Principles, both Speculative and Practical For to what purpose should characters be graven on the mind, by the finger of God, which are not clearer there, than those, which are afterwards introduced, or cannot be distinguished from them? If any one thinks there are such innate ideas and propositions, which by their clearness and usefulness, are distinguishable from all that is adventitious in the mind, and acquired, it will not be a hard matter for him to tell us, which they are; and then everyone will be a fit judge, whether they be so, or no. Since if there be such innate ideas and impressions, plainly different from all other perceptions and knowledge, everyone will find it true in himself, of the evidence of these supposed innate maxims, I have spoken already; of their usefulness, I shall have occasion to speak more hereafter.

§23. Difference of men's discoveries depends upon the different application of their faculties. To conclude, some ideas forwardly offer themselves to all men's understanding; some sorts of truths result from any ideas, as soon as the mind puts them into propositions: other truths require a train of ideas placed in order, a due comparing of them, and deductions made with attention, before they can be discovered, and assented to. Some of the first sort, because of their general and easy reception, have been mistaken for innate: but the truth is, ideas and notions are no more born with us, than arts and sciences; though some of them, indeed, offer themselves to our faculties, more readily than others; and therefore are more generally received; though that too, be according as the organs of our bodies, and powers of our minds, happen to be employed; God having fitted men with faculties and means, to discover, receive, and retain truths, according as they are employed. The great difference that is to be found in the notions of mankind, is, from the different use they put their faculties to, whilst some (and those the most) taking things upon trust, misemploy their power of assent, by lazily enslaving their minds, to the dictates and dominion of others, in doctrines, which 'tis their duty carefully to examine; and not blindly, with an implicit faith,

to swallow: others employing their thoughts only about some few things, grow acquainted sufficiently with them, attain great degrees of knowledge in them, and are ignorant of all other, having never let their thoughts loose, in the search of other inquiries. Thus, that the three angles of a triangle are equal to two right ones, is a truth, as certain as anything can be; and I think more evident, than many of those propositions, that go for principles; and yet there are millions, however expert in other things, who know not this at all, because they never set their thoughts on work about such angles: and he that certainly knows this proposition, may yet be utterly ignorant of the truth of other propositions, in mathematics itself, which are as clear and evident as this; because, in his search of those mathematical truths, he stopped his thoughts short, and went not so far. The same may happen concerning the notions we have of the being of a deity; for though there be no truth, which a man may more evidently make out to himself, than the existence of a God, yet he that shall content himself with things, as he finds them, in this world, as they minister to his pleasures and passions, and not make inquiry a little further into their causes, ends, and admirable contrivances, and pursue the thoughts thereof with diligence and attention, may live long without any notion of such a being: and if any person hath, by talk, put such a notion into his head, he may, perhaps, believe it: but if he hath never examined it, his knowledge of it will be no perfecter, than his, who having been told, that the three angles of a triangle are equal to two right ones, takes it upon trust, without examining the demonstration; and may yield his assent as a probable opinion, but hath no knowledge of the truth of it; which yet his faculties, if carefully employed, were able to make clear and evident to him. But this only by the by, to show how much our knowledge depends upon the right use of those powers nature hath bestowed upon us, and how little upon such innate principles, as are in vain supposed to be in all mankind for their direction; which all Other Considerations concerning Innate Principles, both Speculative and Practical men could not but know, if they were there, or else they would be there to no purpose: and which, since all men do not know, nor can distinguish from other adventitious truths, we may well conclude there are no such.

§24. Men must think and know for themselves. What censure, doubting thus of innate principles, may deserve from men, who will be apt to call it, pulling up the old foundations of knowledge

and certainty, I cannot tell: I persuade myself, at least, that the way I have pursued, being conformable to truth, lays those foundations surer. This I am certain, I have not made it my business, either to quit or follow any authority in the ensuing discourse: truth has been my only aim; and wherever that has appeared to lead, my thoughts have impartially followed, without minding, whether the footsteps of any other lay that way, or not. Not that I want a due respect to other men's opinions; but after all, the greatest reverence is due to truth: and I hope, it will not be thought arrogance to say, that perhaps, we should make greater progress in the discovery of rational and contemplative knowledge, if we sought it in the fountain, in the consideration of things themselves; and made use rather of our own thoughts, than other men's to find it. For, I think, we may as rationally hope to see with other men's eyes, as to know by other men's understandings. So much as we ourselves consider and comprehend of truth and reason, so much we possess of real and true knowledge. The floating of other men's opinions in our brains, makes us not one jot the more knowing, though they happen to be true. What in them was science, is in us but opiniatrety, whilst we give up our assent only to reverend names, and do not, as they did, employ our own reason to understand those truths, which gave them reputation. Aristotle was certainly a knowing man, but nobody ever thought him so, because he blindly embraced, and confidently vented the opinions of another. And if the taking up of another's principles, without examining them, made not him a philosopher, I suppose it will hardly make anybody else so. In the sciences, everyone has so much, as he really knows and comprehends: what he believes only, and takes upon trust, are but shreds; which however well in the whole piece, make no considerable addition to his stock, who gathers them. Such borrowed wealth, like fairy-money, though it were gold in the hand from which he received it, will be but leaves and dust when it comes to use.

§25. Whence the opinion of innate principles. When men have found some general propositions that could not be doubted of, as soon as understood, it was, I know, a short and easy way to conclude them innate. This being once received, it eased the lazy from the pains of search, and stopped the inquiry of the doubtful, concerning all that was once styled innate: and it was of no small advantage to those who affected to be masters and teachers, to make this the principle of principles, that principles must not be questioned: for having once established this tenet, that there are innate principles, it put their

followers upon a necessity of receiving some doctrines as such; which was to take them off from the use of their own reason and judgment, and put them on believing and taking them upon trust without further examination: in which posture of blind credulity, they might be more easily governed by, and made useful to some sort of men, who had the skill and office to principle and guide them. Nor is it a small power it gives one man over another, to have the authority to be the dictator of principles, and teacher of unquestionable truths; and to make a man swallow that for an innate principle, which may serve to his purpose, who teacheth them. Whereas had they examined the ways, whereby men came to the knowledge of many universal truths, they would have found them to result in the minds of men, from the being of things themselves, when duly considered; and that they were discovered by the application of those faculties, that were fitted by nature to receive and judge of them, when duly employed about them.

§26. Conclusion. To show how the understanding proceeds herein, Other Considerations concerning Innate Principles, both Speculative and Practical is the design of the following discourse; which I shall proceed to, when I have first premised, that hithert to clear my way to those foundations, which, I conceive are the only true ones, whereon to establish those notions we can have of our own knowledge, it hath been necessary for me to give an account of the reasons, I had to doubt of innate principles: and since the arguments which are against them, do some of them, rise from common received opinions, I have been forced to take several things for granted, which is hardly avoidable to anyone, whose task is to show the falsehood, or improbability, of any tenet; it happening in controversial discourses, as it does in assaulting of towns; where, if the ground be but firm, whereon the batteries are erected, there is no further inquiry of whom 'tis borrowed, nor whom it belongs to, so it affords but a fit rise for the present purpose. But in the future part of this discourse, designing to raise an edifice uniform, and consistent with itself, as far as my own experience and observation will assist me, I hope, to erect it on such a basis, that I shall not need to shore it up with props and buttresses, leaning on borrowed or begged foundations: or at least, if mine prove a castle in the air, I will endeavour it shall be all of a piece, and hang together. Wherein I warn the reader not to expect undeniable cogent demonstrations, unless I may be allowed the privilege, not seldom assumed by others, to take

my principles for granted; and then, I doubt not, but I can demonstrate too. All that I shall say for the principles I proceed on, is, that I can only appeal to men's own unprejudiced experience, and observation, whether they be true, or not; and this is enough for a man who professes no more, than to lay down candidly and freely his own conjectures, concerning a subject lying somewhat in the dark, without any other design, than an unbiased inquiry after truth.

BOOK II: Of Ideas

Chapter I Of Ideas in General, and their Original

Chapter II Of Simple Ideas

§1. Idea is the object of thinking. Every man being conscious to himself, that he thinks, and that which his mind is applied about, whilst thinking, being the ideas, that are there, 'tis past doubt, that men have in their minds several ideas, such as are those expressed by the words, whiteness, hardness, sweetness, thinking, motion, man, elephant, army, drunkenness, and others: 'tis in the first place then to be inquired, How he comes by them? I know 'tis a received doctrine, that men have native ideas, and original characters stamped upon their minds, in their very first being. This opinion I have at large examined already; and, I suppose, what I have said in the foregoing book, will be much more easily admitted, when I have shown, whence the understanding may get all the ideas it has, and by what ways and degrees they may come into the mind; for which I shall appeal to everyone's own observation and experience.

§2. All ideas come from sensation or reflection. Let us then suppose the mind to be, as we say, white paper, void of all characters, without any ideas: How comes it to be furnished? Whence comes it by that vast store, which the busy and boundless fancy of man has painted on it, with an almost endless variety? Whence has it all the materials of reason and knowledge? To this I answer, in one word, from experience. In that, all our knowledge is founded; and from that it ultimately derives itself. Our observation employed either about external sensible objects; or about the internal operations of our minds, perceived and reflected on by ourselves, is that, which supplies our understandings with all the materials of thinking. These two are the fountains of knowledge, from whence all the ideas we have, or can naturally have, do spring.

§3. The objects of sensation one source of ideas. First, our senses, conversant about particular sensible objects, do convey into the mind, several distinct perceptions of things, according to those various ways, wherein those objects do affect them: and thus we come by those ideas we have of yellow, white, heat, cold, soft, hard, bitter, sweet,

and all those which we call sensible qualities, which when I say the senses convey into the mind, I mean, they from external objects convey into the mind what produces there those perceptions. This great source, of most of the ideas we have, depending wholly upon our senses, and derived by them to the understanding, I call sensation.

§4. The operations of our minds, the other source of them. Secondly, the other fountain, from which experience furnisheth the understanding with ideas, is the perception of the operations of our own mind within us, as 'tis employed about the ideas it has got; which operations, when the soul comes to reflect on, and consider, do furnish the understanding with another set of ideas, which could not be had from things without; and such are, perception, thinking, doubting, believing, reasoning, knowing, willing, and all the different actings of our own minds; which we being conscious of, and observing in ourselves, do from these receive into our understandings, as distinct ideas, as we do from bodies affecting our senses. This source of ideas, every man has wholly in himself: and though it be not sense, as having nothing to do with external objects; yet 'tis very like it, and might properly enough be called internal sense. But as I call the other sensation, so I call this reflection, the ideas it affords being such only, as the mind gets by reflecting on its own operations within itself. By reflection then, in the following part of this discourse, I would be understood to mean, that notice which the mind takes of its own operations, and the manner of them, by reason whereof, there come to be ideas of these operations in the understanding. These two, I say, viz. external, material things, as the objects of sensation; and the operations of our own minds within, as the objects of reflection, are, to me, the only originals, from whence all our ideas take their beginnings. The term operations here, I use in a large sense, as comprehending not barely the actions of the mind about its ideas, but some sort of passions arising sometimes from them, such as is the satisfaction or uneasiness arising from any thought.

§5. All our ideas are of the one or the other of these. The understanding seems to me, not to have the least glimmering of any ideas, which it doth not receive from one of these two. External objects furnish the mind with the ideas of sensible qualities, which are all those different perceptions they produce in us: and the mind furnishes the understanding with ideas of its own operations. These,

when we have taken a full survey of them, and their several modes, combinations, and relations, we shall find to contain all our whole stock of ideas; and that we have nothing in our minds, which did not come in, one of these two ways. Let anyone examine his own thoughts, and thoroughly search into his understanding, and then let him tell me, whether all the original ideas he has there, are any other than of the objects of his senses; or of the operations of his mind, considered as objects of his reflection: and how great a mass of knowledge soever he imagines to be lodged there, he will, upon taking a strict view, see that he has not any idea in his mind, but what one of these two have imprinted; though, perhaps, with infinite variety compounded and enlarged by the understanding, as we shall see hereafter.

§6. Observable in children. He that attentively considers the state of a child, at his first coming into the world, will have little reason to think him stored with plenty of ideas, that are to be the matter of his future knowledge. 'Tis by degrees he comes to be furnished with them: and though the ideas of obvious and familiar qualities, imprint themselves, before the memory begins to keep a register of time and order, yet 'tis often so late, before some unusual qualities come in the way, that there are few men that cannot recollect the beginning of their acquaintance with them: and if it were worth, while, no doubt a child might be so ordered, as to have but a very few, even of the ordinary ideas, till he were grown up to a man. But all that are born into the world being surrounded with bodies, that perpetually and diversely affect them, variety of ideas, whether care be taken about it or no, are imprinted on the minds of children. Light and colours, are busy at hand everywhere, when the eye is but open; sounds and some tangible qualities fail not to solicit their proper senses, and force an entrance to the mind; but yet, I think, it will be granted easily, that if a child were kept in a place, where he never saw any other but black and white, till he were a man, he would have no more ideas of scarlet or green, than he that from his childhood never tasted an oyster, or a pineapple, has of those particular relishes.

§7. Men are differently furnished with these, according to the different objects they converse with. Men then come to be furnished with fewer or more simple ideas from without, according as the objects they converse with, afford greater or less variety; and from the operations of their minds within, according as they more or less reflect

on them. For, though he that contemplates the operations of his mind, cannot but have plain and clear ideas of them; yet unless he turn his thoughts that way, and considers them attentively, he will no more have clear and distinct ideas of all the operations of his mind, and all that may be observed therein, than he will have all the particular ideas of any landscape, or of the parts and motions of a clock, who will not turn his eyes to it, and with attention heed all the parts of it. The picture, or clock may be so placed, that they may come in his way every day; but yet he will have but a confused idea of all the parts they are made up of, till he applies himself with attention, to consider them each in particular.

§8. Ideas of reflection later, because they need attention. And hence we see the reason, why 'tis pretty late, before most children get ideas of the operations of their own minds; and some have not any very, clear, or perfect ideas of the greatest part of them all their lives. Because, though they pass there continually; yet like floating visions, they make not deep impressions enough, to leave in the mind clear distinct lasting ideas, till the understanding turns inwards upon itself, reflects on its own operations, and makes them the object of its own contemplation. Children, when they come first into it, are surrounded with a world of new things, which, by a constant solicitation of their senses, draw the mind constantly to them, forward to take notice of new, and apt to be delighted with the variety of changing objects. Thus the first years are usually employed and diverted in looking abroad. Men's business in them is to acquaint themselves with what is to be found without; and so growing up in a constant attention to outward sensations, seldom make any considerable reflection on what passes within them, till they come to be of riper years; and some scarce ever at all.

§9. The soul begins to have ideas when it begins to perceive. To ask, at what time a man has first any ideas, is to ask, when he begins to perceive; having ideas, and perception, being the same thing. I know 'tis an opinion, that the soul always thinks, and that it has the actual perception of ideas in itself constantly, as long as it exists; and that actual thinking is as inseparable from the soul, as actual extension is from the body; which if true, to inquire after the beginning of a man's ideas, is the same, as to inquire after the beginning of his soul. For by this account, soul and its ideas, as body and its extension, will begin to exist both at the same time.

§10. The soul thinks not always; for this wants proofs. But whether the soul be supposed to exist antecedent to, or coeval with, or some time after the first rudiments of organization, or the beginnings of life in the body, I leave to be disputed by those, who have better thought of that matter. I confess myself, to have one of those dull souls, that doth not perceive itself always to contemplate ideas; nor can conceive it any more necessary for the soul always to think, than for the body always to move; the perception of ideas being (as I conceive) to the soul, what motion is to the body, not its essence, but one of its operations: and therefore, though thinking be supposed never so much the proper action of the soul; yet 'tis not necessary, to suppose, that it should be always thinking, always in action. That, perhaps, is the privilege of the infinite Author and Preserver of things, 'who never slumbers nor sleeps' but is not competent to any finite being, at least not to the soul of man. We know certainly by experience, that we sometimes think, and thence draw this infallible consequence, that, there is something in us, that has a power to think, but whether that substance perpetually thinks, or no, we can be no further assured, than experience informs us. For to say, that actual thinking is essential to the soul, and inseparable from it, is to beg, what is in question, and not to prove it by reason; which is necessary to be done, if it be not a self evident proposition. But whether this, 'that the soul always thinks' be a self evident proposition, that everybody assents to at first hearing, I appeal to mankind. 'Tis doubted whether I thought all last night, or no; the question being about a matter of fact, 'tis begging it to bring, as a proof for it, an hypothesis, which is the very thing in dispute; by which way one may prove anything, and 'tis but supposing that all watches, whilst the balance beats, think, and 'tis sufficiently proved, and past doubt, that my watch thought all last night. But he, that would not deceive himself, ought to build his hypothesis on matter of fact, and make it out by sensible experience, and not presume on matter of fact, because of his hypothesis, that is, because he supposes it to be so; which way of proving, amounts to this, that I must necessarily think all last night, because another supposes I always think, though I myself cannot perceive, that I always do so. But men in love with their opinions, may not only suppose what is in question, but allege wrong matter of fact. How else could anyone make it an inference of mine, that a thing is not, because we are not sensible of it in our sleep? I do not say there is no soul in a man, because he is not sensible of it in his sleep: but I do say, he cannot think at any time waking or sleeping, without being

sensible of it. Our being sensible of 'tis not necessary to anything, but to our thoughts; and to them 'tis, and to them it will always be necessary, till we can think without being conscious of it.

§11. 'Tis not always conscious of it. I grant that the soul in a waking man, is never without thought because 'tis the condition of being awake, but whether sleeping without dreaming be not an affection of the whole man, mind as well as body, may be worth a waking man's consideration; it being hard to conceive, that anything should think, and not be conscious of it. If the soul doth think in a sleeping man, without being conscious of it, I ask, whether, during such thinking, it has any pleasure or pain, or be capable of happiness or misery? I am sure the man is not, no more than the bed or earth he lies on. For to be happy or miserable without being conscious of it, seems to me utterly inconsistent and impossible. Or if it be possible, that the soul can, whilst the body is sleeping, have its thinking, enjoyments, and concerns, its pleasures or pain apart, which the man is not conscious of, nor partakes in: 'tis certain, that Socrates asleep, and Socrates awake, is not the same person: but his soul when he sleeps, and Socrates the man consisting of body and soul when he is waking, are two persons; since waking Socrates, has no knowledge of, or concernment for that happiness, or misery of his soul, which it enjoys alone by itself whilst he sleeps, without perceiving anything of it; no more than he has for the happiness, or misery of a man in the Indies, whom he knows not. For if we take wholly away all consciousness of our actions and sensations, especially of pleasure and pain, and the concernment that accompanies it, it will be hard to know wherein to place personal identity.

§12. If a sleeping man thinks without knowing it, the sleeping and waking man are two persons. The soul, during sound sleep, thinks, say these men. Whilst it thinks and perceives, 'tis capable certainly of those of delight or trouble, as well as any other perceptions; and it must necessarily be conscious of its own perceptions. But it has all this apart: the sleeping man, 'tis plain, is conscious of nothing of all this.

Let us suppose then the soul of Castor, while he is sleeping, retired from his body, which is no impossible supposition for the men I have here to do with, who so liberally allow life, without a thinking soul to all other animals. These men cannot then judge it impossible, or a contradiction, that the body should live without the

soul; nor that the soul should subsist and think, or have perception, even perception of happiness or misery, without the body. Let us then, as I say, suppose the soul of Castor separated, during his sleep, from his body, to think apart. Let us suppose too, that it chooses for its scene of thinking, the body of another man, v.g. Pollux, who is sleeping without a soul: for if Castor's soul can think whilst Castor is asleep, what Castor is never conscious of, 'tis no matter what place it chooses to think in. We have here then, the bodies of two men with only one soul between them, which we will suppose to sleep and wake by turns; and the soul still thinking in the waking man, whereof the sleeping man is never conscious, has never the least perception. I ask, then, whether Castor and Pollux, thus, with only one soul between them, which thinks and perceives in one, what the other is never conscious of, nor is concerned for, are not two as distinct persons, as Castor and Hercules; or, as Socrates and Plato were? And whether one of them might not be very happy, and the other very miserable? Just by the same reason, they make the soul and the man two persons, who make the soul think apart, what the man is not conscious of. For, I suppose, nobody will make identity of persons, to consist in the soul's being united to the very same numerical particles of matter: for if that be necessary to identity, it will be impossible, in that constant flux of the particles of our bodies, that any man should be the same person, two days, or two moments together.

§13. Impossible to convince those that sleep without dreaming, that they think. Thus, methinks, every drowsy nod shakes their doctrine, who teach, that the soul is always thinking. Those, at least, who do at any time sleep without dreaming, can never be convinced, that their thoughts are sometimes for four hours busy without their knowing of it; and if they are taken in the very act, waked in the middle of that sleeping contemplation, can give no manner of account of it.

§14. That men dream without remembering it, in vain urged. It will perhaps be said, that the soul thinks, even in the soundest sleep, but the memory retains it not. That the soul in a sleeping man should be this moment busy a thinking, and the next moment in a waking man, not remember, nor be able to recollect one jot of all those thoughts, is very hard to be conceived, and would need some better proof than bare assertion, to make it be believed. For who can without any more ado, but being barely told so, imagine, that the greatest part

of men, do, during all their lives, for several hours every day, think of something, which if they were asked, even in the middle of these thoughts, they could remember nothing at all of. Most men, I think, pass a great part of their sleep without dreaming. I once knew a man, that was bred a scholar, and had no bad memory, who told me, he had never dreamed in his life, till he had that fever, he was then newly recovered of, which was about the five or six and twentieth year of his age. I suppose the world affords more such, instances: at least everyone's acquaintance will furnish him with examples enough of such as pass most of their nights without dreaming.

§15. Upon this hypothesis, the thoughts of a sleeping man ought to be most rational. To think often, and never to retain it so much as one moment, is a very useless sort of thinking: and the soul in such a state of thinking, does very little if at all, excel that of a looking-glass, which constantly receives variety of images, or ideas, but retains none; they disappear and vanish, and there remain no footsteps of them; the looking-glass is never the better for such ideas, nor the soul for such thoughts. Perhaps it will be said, that in a waking man, the materials of the body are employed, and made use of, in thinking; and that the memory of thoughts, is retained by the impressions that are made on the brain, and the traces there left after such thinking; but that in the thinking of the soul, which is not perceived in a sleeping man, there the soul thinks apart, and making no use of the organs of the body, leaves no impressions on it, and consequently no memory of such thoughts. Not to mention again the absurdity of two distinct persons, which follows from this supposition, I answer further, that whatever ideas the mind can receive, and contemplate without the help of the body, 'tis reasonable to conclude, it can retain without the help of the body too, or else the soul, or any separate spirit will have but little advantage by thinking. If it has no memory of its own thoughts; if it cannot lay them up for its use, and be able to recall them upon occasion; if it cannot reflect upon what is past, and make use of its former experiences, reasonings, and contemplations, to what purpose does it think? They, who make the soul a thinking thing, at this rate, will not make it a much more noble being, than those do, whom they condemn, for allowing it to be nothing but the subtilist parts of matter. Characters drawn on dust, that the first breath of wind effaces; or impressions made on a heap of atoms, or animal spirits, are altogether as useful, and render the subject as noble, as the thoughts of a soul that perish in thinking; that once out of sight, are gone

forever, and leave no memory of themselves behind them.

Nature never makes excellent things, for mean or no uses: and 'tis hardly to be conceived, that our infinitely wise Creator, should make so admirable a faculty, as the power of thinking, that faculty which comes nearest the excellency of his own incomprehensible being, to be so idly and uselessly employed, at least a fourth part of its time here, as to think constantly, without remembering any of those thoughts, without doing any good to itself or others, or being any way useful to any other part of the creation. If we will examine it, we shall not find, I suppose, the motion of dull and senseless matter, anywhere in the universe, made so little use of, and so wholly thrown away.

§16. On this hypothesis the soul must have ideas not derived from sensation or reflection, of which there is no appearance. 'Tis true, we have sometimes instances of perception, whilst we are asleep, and retain the memory of those thoughts: but how extravagant and incoherent for the most part they are; how little conformable to the perfection and order of a rational being, those who are acquainted with dreams, need not be told. This I would willingly be satisfied in, whether the soul, when it thinks thus apart, and as it were separate from the body, acts less rationally than when conjointly with it, or no: if its separate thoughts be less rational, then these men must say, that the soul owes the perfection of rational thinking to the body: if it does not, 'tis a wonder that our dreams should be, for the most part, so frivolous and irrational; and that the soul should retain none of its more rational soliloquies and meditations.

§17. If I think when I know it not, nobody else can know it. Those who so confidently tell us, that the soul always actually thinks, I would they would also tell us, what those ideas are, that are in the soul of a child, before, or just at the union with the body, before it hath received any by sensation. The dreams of sleeping men are, as I take it, all made up of the waking man's ideas, though, for the most part, oddly put together. 'Tis strange, if the soul has ideas of its own that it derived not from sensation or reflection, (as it must have, if it thought before it received any impressions from the body) that it should never, in its private thinking, (so private, that the man himself perceives it not) retain any of them, the very moment it wakes out of them, and then make the man glad with new discoveries.

Who can find it reasonable that the soul should, in its

retirement,during sleep, have so many hours thoughts, and yet never light on any of those ideas it borrowed not from sensation or reflection; or at least preserve the memory of none, but such, which being occasioned from the body, must needs be less natural to a spirit“ ’Tis strange,the soul should never once in a man’s whole life, recall over any of its pure, native thoughts, and those ideas it had before it borrowed anything from the body; never bring into the waking man’s view, any other ideas, but what have a tang of the cask, and manifestly derive their original from that union. If it always thinks, and so had ideas before it was united, or before it received any from the body, ’tis not to be supposed, but that during sleep, it recollects its native ideas, and during that retirement from communicating with the body, whilst it thinks by itself, the ideas, ’tis busied about, should be, sometimes at least, those more natural and congenial ones which it had in itself, underived from the body, or its own operations about them:which since the waking man never remembers, we must from this hypothesis conclude, either that the soul remembers something that the man does not; or else that memory belongs only to such ideas, as are derived from the body, or the mind’s operations about them.

§18. How knows anyone that the soul always thinks‘ For if it be not a self-evident proposition, it needs proof. I would be glad also to learn from these men, who so confidently pronounce, that the human soul, or which is all one, that a man always thinks, how they come to know it; nay, how they come to know that they themselves think,when they themselves do not perceive it. This I am afraid, is to be sure,without proofs; and to know, without perceiving. ’Tis, I suspect, a confused notion, taken up to serve an hypothesis; and none of those clear truths, that either their own evidence forces us to admit, or common experience makes it impudence to deny. For the most that can be said of it, is, that ’tis possible the soul may always think, but not always retain it in memory: and, I say, ’tis as possible, that the soul may not always think; and much more probable, that it should sometimes not think, than that it should often think, and that a long while together, and not be conscious to itself the next moment after,that it had thought.

§19. That a man should be busy in thinking, and yet not retain it the next moment, very improbable. To suppose the soul to think, and the man not to perceive it, is, as has been said, to make two persons in one man: and if one considers well these men’s way of speaking, one

should be led into a suspicion, that they do so. For they who tell us that the soul always thinks, do never, that I remember, say, that a man always thinks. Can the soul think, and not the man? Or a man think, and not be conscious of it? This perhaps, would be suspected of jargon in others. If they say, the man thinks always, but is not always conscious of it; they may as well say, his body is extended, without having parts. For 'tis altogether as intelligible to say, that a body is extended without parts, as that anything thinks without being conscious of it, or perceiving, that it does so. They who talk thus, may, with as much reason, if it be necessary to their hypothesis, say, that a man is always hungry, but that he does not always feel it: whereas hunger consists in that very sensation, as thinking consists in being conscious that one thinks. If they say, that a man is always conscious, to himself of thinking; I ask, how they know it?

Consciousness is the perception of what passes in a man's own mind. Can another man perceive, that I am conscious of anything, when I perceive it not myself? No man's knowledge here, can go beyond his experience. Wake a man out of a sound sleep, and ask him, what he was that moment thinking on? If he himself be conscious of nothing he then thought on, he must be a notable diviner of thoughts, that can assure him, that he was thinking: may he not with more reason assure him, he was not asleep? This is something beyond philosophy; and it cannot be less than revelation, that discovers to another, thoughts in my mind, when I can find none there myself: and they must needs have a penetrating sight, who can certainly see, that I think, when I cannot perceive it myself, and when I declare, that I do not; and yet can see, that dogs or elephants do not think, when they give all the demonstration of it imaginable, except only telling us, that they do so. This some may suspect to be a step beyond the Rosicrucians; it seeming easier to make one, self invisible to others, than to make another's thoughts visible to me, which are not visible to himself. But 'tis but defining the soul to be a substance, that always thinks, and the business is done. If such definition be of any authority, I know not what it can serve for, but to make many men suspect, that they have no souls at all, since they find a good part of their lives pass away without thinking. For no definitions, that I know, no suppositions of any sect, are of force enough to destroy constant experience; and perhaps, 'tis the affectation of knowing beyond what we perceive, that makes so much useless dispute, and noise, in the world.

§20. No ideas but from sensation and reflection, evident, if we observe children. I see no reason therefore to believe, that the soul thinks before the senses have furnished it with ideas to think on; and as those are increased, and retained; so it comes, by exercise, to improve its faculty of thinking in the several parts of it, as well as afterwards, by compounding those ideas, and reflecting on its own operations, it increases its stock as well as facility, in remembering, imagining, reasoning, and other modes of thinking.

§21. State of a child in the mother's womb. He that will suffer himself, to be informed by observation and experience, and not make his own hypothesis the rule of nature, will find few signs of a soul accustomed to much thinking in a new-born child, and much fewer of any reasoning at all. And yet 'tis hard to imagine, that the rational soul should think so much, and not reason at all. And he that will consider, that infants, newly come into the world, spend the greatest part of their time in sleep, and are seldom awake, but when either hunger calls for the teat, or some pain, (the most importunate of all sensations) or some other violent impression on the body, forces the mind to perceive, and attend to it. He, I say, who considers this, will perhaps, find reason to imagine, that a foetus in the mother's womb, differs not much from the state of a vegetable; but passes the greatest part of its time without perception or thought, doing very little, but sleep in a place, where it needs not seek for food, and is surrounded with liquor, always equally soft, and near of the same temper; where the eyes have no light, and the ears, so shut up, are not very susceptible of sounds; and where there is little or no variety, or change of objects, to move the senses.

§22. The mind thinks in proportion to the matter it gets from experience to think about. Follow a child from its birth, and observe the alterations that time makes, and you shall find, as the mind by the senses comes more and more to be furnished with ideas, it comes to be more and more awake; thinks more, the more it has matter to think on. After some time, it begins to know the objects, which being most familiar with it, have made lasting impressions. Thus it comes, by degrees, to know the persons it daily converses with, and distinguishes them from strangers; which are instances and effects of its coming to retain and distinguish the ideas the senses convey to it: and so we may observe, how the mind, by degrees, improves in these, and advances to the exercise of those other faculties of enlarging, compounding, and

abstracting its ideas, and of reasoning about them, and reflecting upon all these, of which, I shall have occasion to speak more hereafter.

§23. A man begins to have ideas when he first has sensation. What sensation is. If it shall be demanded then, when a man begins to have any ideas' I think, the true answer is, when he first has any sensation. For since there appear not to be any ideas in the mind, before the senses have conveyed any in, I conceive that ideas in the understanding, are coeval with sensation; which is such an impression or motion, made in some part of the body, as produces some perception in the understanding. 'Tis about these impressions made on our senses by outward objects, that the mind seems first to employ itself in such operations as we call perception, remembering, consideration, reasoning, etc.

§24. The original of all our knowledge. In time, the mind comes to reflect on its own operations, about the ideas got by sensation, and thereby stores itself with a new set of ideas, which I call ideas of reflection. These are the impressions that are made on our senses by outward objects, that are extrinsical to the mind; and its own operations, proceeding from powers intrinsical and proper to itself, which when reflected on by itself, become also objects of its contemplation, are, as I have said, the original of all knowledge. Thus the first capacity of human intellect, is, that the mind is fitted to receive the impressions made on it; either, through the senses, by outward objects; or by its own operations, when it reflects on them. This is the first step a man makes towards the discovery of anything, and the groundwork, whereon to build all those notions, which ever he shall have naturally in this world. All those sublime thoughts, which tower above the clouds, and reach as high as heaven itself, take their rise and footing here: in all that great extent wherein the mind wanders, in those remote speculations, it may seem to be elevated with, it stirs not one jot beyond those ideas, which sense or reflection have offered for its contemplation.

§25. In the reception of simple ideas, the understanding is for the most part passive. In this part the understanding is merely passive; and whether or no, it will have these beginnings, and as it were materials of knowledge, is not in its own power. For the objects of our senses, do, many of them, obtrude their particular ideas upon our minds, whether we will or no: and the operations of our minds, will

not let us be without, at least some obscure notions of them. No man can be wholly ignorant of what he does, when he thinks. These simple ideas, when offered to the mind, the understanding can no more refuse to have, nor alter, when they are imprinted, nor blot them out, and make new ones itself, than a mirror can refuse, alter, or obliterate the images or ideas, which, the objects set before it, do therein produce. As the bodies that surround us, do diversely affect our organs, the mind is forced to receive the impressions; and cannot avoid the perception of those ideas that are annexed to them.

Chapter II Of Simple Ideas

§1. Uncompounded appearances. The better to understand the nature, manner, and extent of our knowledge, one thing is carefully to be observed concerning the ideas we have; and that is, that some of them are simple and some complex.

Though the qualities that affect our senses are, in the things themselves, so united and blended, that there is no separation, no distance between them; yet 'tis plain, the ideas they produce in the mind enter by the senses simple and unmixed. For, though the sight and touch often take in from the same object, at the same time, different ideas; as a man sees at once motion and colour; the hand feels softness and warmth in the same piece of wax: yet the simple ideas thus united in the same subject, are as perfectly distinct as those that come in by different senses. The coldness and hardness which a man feels in a piece of ice being as distinct ideas in the mind as the smell and whiteness of a lily; or as the taste of sugar, and smell of a rose. And there is nothing can be plainer to a man than the clear and distinct perception he has of those simple ideas; which, being each in itself uncompounded, contains in it nothing but one uniform appearance, or conception in the mind, and is not distinguishable into different ideas.

§2. The mind can neither make nor destroy them. These simple ideas, the materials of all our knowledge, are suggested and furnished to the mind only by those two ways above mentioned, viz. sensation and reflection. When the understanding is once stored with these simple ideas, it has the power to repeat, compare, and unite them, even to an almost infinite variety, and so can make at pleasure new complex ideas. But 'tis not in the power of the most exalted wit, or

enlarged understanding, by any quickness or variety of thought, to invent or frame one new simple idea in the mind, not taken in by the ways before mentioned: nor can any force of the understanding destroy those that are there. The dominion of man, in this little world of his own understanding being muchwhat the same as 'tis in the great world of visible things; wherein his power, however managed by art and skill, reaches no farther than to compound and divide the materials that are made to his hand; but can do nothing towards the making the least particle of new matter, or destroying one atom of what is already in being. The same inability, will everyone find in himself, who shall go about to fashion in his understanding one simple idea, not received in by his senses from external objects, or by reflection from the operations of his own mind about them. I would have any one try to fancy any taste which had never affected his palate; or frame the idea of a scent he had never smelt: and when he can do this, I will also conclude that a blind man hath ideas of colours, and a deaf man true distinct notions of sounds.

§3. Only the qualities that affect the senses are imaginable. This is the reason why, though we cannot believe it impossible to God to make a creature with other organs, and more ways to convey into the understanding the notice of corporeal things than those five, as they are usually counted, which he has given to man yet I think 'tis not possible for any man to imagine any other qualities in bodies, howsoever constituted, whereby they can be taken notice of, besides sounds, tastes, smells, visible and tangible qualities. And had mankind been made but with four senses, the qualities then which are the objects of the fifth sense had been as far from our notice, imagination, and conception, as now any belonging to a sixth, seventh, or eighth sense can possibly be; which, whether yet some other creatures, in some other parts of this vast and stupendous universe, may not have, will be a great presumption to deny. He that will not set himself proudly at the top of all things, but will consider the immensity of this fabric, and the great variety that is to be found in this little and inconsiderable part of it which he has to do with, may be apt to think that, in other mansions of it, there may be other and different intelligent beings, of whose faculties he has as little knowledge or apprehension as a worm shut up in one drawer of a cabinet, hath of the senses or understanding of a man; such variety and excellency being suitable to the wisdom and power of the Maker. I have here followed the common opinion of man's having but five senses; though,

perhaps, there may be justly counted more;but either supposition serves equally to my present purpose.

Chapter III Of Ideas of One Sense

§1. Division of simple ideas. The better to conceive the ideas we receive from sensation, it may not be amiss for us to consider them, in reference to the different ways whereby they make their approaches to our minds, and make themselves perceivable by us.

First, then, There are some which come into our minds by one sense only.

Secondly, there are others that convey themselves into the mind by more senses than one.

Thirdly, Others that are had from reflection only.

Fourthly, There are some that make themselves way, and are suggested to the mind by all the ways of sensation and reflection.

We shall consider them apart under these several heads.

First. There are some ideas which have admittance only through one sense, which is peculiarly adapted to receive them. Thus light and colours, as white, red, yellow, blue; with their several degrees or shades and mixtures, as green, scarlet, purple, seagreen, and the rest, come in only by the eyes. All kinds of noises, sounds, and tones, only by the ears: The several tastes and smells, by the nose and palate. And if these organs, or the nerves which are the conduits to convey them from without to their audience in the brain, the mind's presence-room (as I may so call it) are any of them so disordered as not to perform their functions, they have no postern to be admitted by; no other way to bring themselves into view, and be perceived by the understanding.

The most considerable of those belonging to the touch, are heat and cold, and solidity: all the rest, consisting almost wholly in the sensible configuration, as smooth and rough; or else more, or less firm adhesion of the parts, as hard and soft, tough and brittle, are obvious enough.

§2. Few simple ideas have names. I think it will be needless to

enumerate all the particular simple ideas, belonging to each sense. Nor indeed is it possible, if we would, there being a great many more of them belonging to most of the senses, than we have names for. The variety of smells, which are as many almost, if not more than species of bodies in the world, do most of them want names. Sweet and stinking commonly serve our turn for these ideas, which in effect is little more than to call them pleasing or displeasing; though the smell of a rose and violet, both sweet, are certainly very distinct ideas. Nor are the different tastes, that by our palates we receive ideas of, much better provided with names. Sweet, bitter, sour, harsh, and salt are almost all the epithets we have to denominate that numberless variety of relishes, which are to be found distinct, not only in almost every sort of creatures, but in the different parts of the same plant, fruit, or animal. The same may be said of colours and sounds. I shall, therefore, in the account of simple ideas I am here giving, content myself to set down only such as are most material to our present purpose, or are in themselves less apt to be taken notice of though they are very frequently the ingredients of our complex ideas; amongst which, I think, I may well account solidity, which therefore I shall treat of in the next chapter.

Chapter IV Of Solidity

§1. We receive this idea from touch. The idea of solidity we receive by our touch: and it arises from the resistance which we find in body to the entrance of any other body into the place it possesses, till it has left it. There is no idea which we receive more constantly from sensation than solidity. Whether we move or rest, in what posture soever we are, we always feel something under us that support us, and hinders our further sinking downwards; and the bodies which we daily handle make us perceive that, whilst they remain between them, they do by an insurmountable force, hinder the approach of the parts of our hands that press them. That which thus hinders the approach of two bodies, when they are moved one towards another, I call solidity. I will not dispute whether this acceptation of the word solid be nearer to its original signification than that which mathematicians use it in. It suffices that I think the common notion of solidity will allow, if not justify, this use of it; but if any one think it better to call it impenetrability, he has my consent. Only I have thought the term solidity the more proper to express this

idea, not only because of its vulgar use in that sense, but also because it carries something more of positive in it than impenetrability; which is negative, and is perhaps more a consequence of solidity, than solidity itself. This, of all other, seems the idea most intimately connected with, and essential to body; so as nowhere else to be found or imagined, but only in matter. And though our senses take no notice of it, but in masses of matter, of a bulk sufficient to cause a sensation in us: yet the mind, having once got this idea from such grosser sensible bodies, traces it further, and considers it, as well as figure, in the minutest particle of matter that can exist; and finds it inseparably inherent in body, wherever or however modified.

§2. Solidity fills space. This is the idea which belongs to body, whereby we conceive it to fill space. The idea of which filling of space is, that where we imagine any space taken up by a solid substance, we conceive it so to possess it, that it excludes all other solid substances; and, will forever hinder any other two bodies, that move towards one another in a straight line, from coming to touch one another, unless it removes from between them in a line not parallel to that which they move in. This idea of it, the bodies which we ordinarily handle sufficiently furnish us with.

§3. Distinct from space. This resistance, whereby it keeps other bodies out of the space which it possesses, is so great, that no force, how great soever, can surmount it. All the bodies in the world, pressing a drop of water on all sides, will never be able to overcome the resistance which it will make, soft as 'tis, to their approaching one another, till it be removed out of their way: whereby our idea of solidity is distinguished both from pure space, which is capable neither of resistance nor motion; and from the ordinary idea of hardness.

For a man may conceive two bodies at a distance, so as they may approach one another, without touching or displacing any solid thing, till their superficies come to meet; whereby, I think, we have the clear idea of space without solidity. For (not to go so far as annihilation of any particular body) I ask, whether a man cannot have the idea of the motion of one single body alone, without any other succeeding immediately into its place? I think 'tis evident he can: the idea of motion in one body no more including the idea of motion in another, than the idea of a square figure in one body includes the idea of a

square figure in another. I do not ask, whether bodies do so exist, that the motion of one body cannot really be without the motion of another. To determine this either way, is to beg the question for or against a vacuum. But my question is, whether one cannot have the idea of one body moved, whilst others are at rest' And I think this no one will deny. If so, then the place it deserted gives us the idea of pure space without solidity; whereinto any other body may enter, without either resistance or protrusion of anything. When the sucker in a pump is drawn, the space it filled in the tube is certainly the same whether any other body follows the motion of the sucker or not: nor does it imply a contradiction that, upon the motion of one body, another that is only contiguous to it should not follow it. The necessity of such a motion is built only on the supposition that the world is full; but not on the distinct ideas of space and solidity, which are as different as resistance and not resistance, protrusion and not protrusion. And that men have ideas of space without a body, their very disputes about a vacuum plainly demonstrate, as is shown in another place.

§4. From hardness. Solidity is hereby also differenced from hardness, in that solidity consists in repletion, and so an utter exclusion of other bodies out of the space it possesses: but hardness, in a firm cohesion of the parts of matter, making up masses of a sensible bulk, so that the whole does not easily change its figure. And indeed, hard and soft are names that we give to things only in relation to the constitutions of our own bodies; that being generally called hard by us, which will put us to pain sooner than change figure by the pressure of any part of our bodies; and that, on the contrary, soft, which changes the situation of its parts upon an easy and unpainful touch.

But this difficulty of changing the situation of the sensible parts amongst themselves, or of the figure of the whole, gives no more solidity to the hardest body in the world than to the softest; nor is an adamant one jot more solid than water. For, though the two flat sides of two pieces of marble will more easily approach each other, between which there is nothing but water or air, than if there be a diamond between them; yet 'tis not, that the parts of the diamond are more solid than those of water, or resist more; but because the parts of water, being more easily separable from each other, they will by a side motion be more easily removed, and give way to the approach of

the two pieces of marble: But if they could be kept from making place by that side motion, they would eternally hinder the approach of these two pieces of marble, as much as the diamond; and it would be as impossible by any force to surmount their resistance, as to surmount the resistance of the parts of a diamond. The softest body in the world will as invincibly resist the coming together of any other two bodies, if it be not put out of the way, but remain between them, as the hardest that can be found or imagined. He that shall fill a yielding soft body well with air or water, will quickly find its resistance. And he that thinks that nothing but bodies that are hard can keep his hands from approaching one another, may be pleased to make a trial, with the air inclosed in a football. The experiment, I have been told, was made at Florence, with a hollow globe of gold filled with water, and exactly closed; which further shows the solidity of so soft a body as water. For the golden globe thus filled, being put into a press, which was driven by the extreme force of screws, the water made itself way through the pores of that very close metal, and finding no room for a nearer approach of its particles within, got to the outside, where it rose like a dew, and so fell in drops, before the sides of the globe could be made to yield to the violent compression of the engine that squeezed it.

§5. On solidity depend impulse, resistance, and protrusion. By this idea of solidity is the extension of body distinguished from the extension of space: the extension of body being nothing, but the cohesion or continuity of solid, separable, movable parts; and the extension of space, the continuity of unsolid, inseparable, and immovable parts. Upon the solidity of bodies also depend their mutual impulse, resistance, and protrusion. Of pure space then, and solidity, there are several (amongst which I confess myself one) who persuade themselves they have clear and distinct ideas; and that they can think on space, without anything in it that resists or is protruded by body. This is the idea of pure space, which they think they have as clear as any idea they can have of the extension of body: the idea of the distance between the opposite parts of a concave superficies, being equally as clear, without, as with the idea of any solid parts between: and on the other side, they persuade themselves that they have, distinct from that of pure space, the idea of something that fills space, that can be protruded by the impulse of other bodies, or resist their motion. If there be others, that have not these two ideas distinct but confound them, and make but one of them, I know not how men, who have the same idea, under different names, or different ideas

under the same name, can in that case talk with one another; any more than a man who, not being blind, or deaf, has distinct ideas of the colour of scarlet and the sound of a trumpet, could discourse concerning scarlet colour with the blind man I mentioned in another place, who fancied that the idea of scarlet was like the sound of a trumpet.

§6. What solidity is. If any one ask me, what this solidity is, I send him to his senses to inform him. Let him put a flint or a football between his hands, and then endeavour to join them, and he will know. If he thinks this not a sufficient explication of solidity, what 'tis, and wherein it consists; I promise to tell him what 'tis, and wherein it consists, when he tells me what thinking is, or wherein it consists; or explains to me what extension or motion is, which perhaps seems much easier. The simple ideas we have, are such as experience teaches them us; but if, beyond that, we endeavour by words to make them clearer in the mind, we shall succeed no better than if we went about to clear up the darkness of a blind man's mind by talking; and to discourse into him the ideas of light and colours. The reason of this I shall show in another place.

Chapter V Of Simple Ideas of Divers Senses

The ideas we get by more than one sense are, of space or extension, figure, rest, and motion. For these make perceivable impressions, both on the eyes and touch; and we can receive and convey into our minds the ideas of the extension, figure, motion, and rest of bodies, both by seeing and feeling. But having occasion to speak more at large of these in another place, I here only enumerate them.

Chapter VI Of Simple Ideas of Reflection

§1. Are the operations of the mind about its other ideas. The mind receiving the ideas mentioned in the foregoing chapters from without, when it turns its view inward upon itself, and observes its own actions about those ideas it has, takes from thence other ideas, which are as capable to be the objects of its contemplation as any of those it received from foreign things.

§2. The idea of perception, and idea of willing, we have from

reflection. The two great and principal actions of the mind, which are most frequently considered, and which are so frequent that every one that pleases may take notice of them in himself, are these two: perception, or thinking; and volition, or willing.

The power of thinking is called the Understanding, and the power of volition is called the Will; and these two powers or abilities in the mind are denominated faculties. Of some of the modes of these simple ideas of reflection, such as are remembrance, discerning, reasoning, judging, knowledge, faith, etc., I shall have occasion to speak hereafter.

Chapter VII Of Simple Ideas of both Sensation and Reflection

§1. Pleasure and pain. There be other simple ideas which convey themselves into the mind, by all the ways of sensation and reflection, viz.

pleasure, or delight, and its opposite,

pain, or uneasiness;

power.

existence.

unity.

§2. Delight or uneasiness, one or other of them join themselves to almost all our ideas, both of sensation and reflection: and there is scarce any affection of our senses from without, any retired thought of our mind within, which is not able to produce in us pleasure or pain. By pleasure and pain, I would be understood to signify, whatsoever delights or molests us; whether it arises from the thoughts of our minds, or anything operating on our bodies. For, whether we call it satisfaction, delight, pleasure, happiness, etc., on the one side, or uneasiness, trouble, pain, torment, anguish, misery, etc., on the other, they are still but different degrees of the same thing, and belong to the ideas of pleasure and pain, delight or uneasiness; which are the names I shall most commonly use for those two sorts of ideas.

§3. The infinite wise Author of our being, having given us the power over several parts of our bodies, to move or keep them at rest as we think fit; and also. by the motion of them, to move ourselves and other contiguous bodies, in which consist all the actions of our body: having also given a power to our minds, in several instances, to choose, amongst its ideas, which it will think on, and to pursue the inquiry of this or that subject with consideration and attention, to excite us to these actions of thinking and motion that we are capable of, has been pleased to join to several thoughts, and several sensations a perception of delight. If this were wholly separated from all our outward sensations, and inward thoughts, we should have no reason to prefer one thought or action to another; negligence to attention, or motion to rest. And so we should neither stir our bodies, nor employ our minds, but let our thoughts (if I may so call it) run adrift, without any direction or design, and suffer the ideas of our minds, like unregarded shadows, to make their appearances there, as it happened, without attending to them. In which state man, however furnished with the faculties of understanding and will, would be a very idle, inactive creature, and pass his time only in a lazy, lethargic dream.

It has therefore pleased our wise creator to annex to several objects, and the ideas which we receive from them, as also to several of our thoughts, a concomitant pleasure, and that in several objects, to several degrees, that those faculties which he had endowed us with might not remain wholly idle and unemployed by us.

§4. Pain has the same efficacy and use to set us on work that pleasure has, we being as ready to employ our faculties to avoid that, as to pursue this: only this is worth our consideration, that pain is often produced by the same objects and ideas that produce pleasure in us. This their near conjunction, which makes us often feel pain in the sensations where we expected pleasure, gives us new occasion of admiring the wisdom and goodness of our Maker, who, designing the preservation of our being, has annexed pain to the application of many things to our bodies, to warn us of the harm that they will do, and as advices to withdraw from them. But he, not designing our preservation barely, but the preservation of every part and organ in its perfection, hath, in many cases, annexed pain to those very ideas which delight us. Thus heat, that is very agreeable to us in one degree, by a little greater increase of it proves no ordinary torment: and the

most pleasant of all sensible objects, light itself, if there be too much of it, if increased beyond a due proportion to our eyes, causes a very painful sensation. Which is wisely and favourably so ordered by nature, that when any object does, by the vehemency of its operation, disorder the instruments of sensation, whose structures cannot but be very nice and delicate, we might, by the pain, be warned to withdraw, before the organ be quite put out of order, and so be unfitted for its proper function for the future. The consideration of those objects that produce it may well persuade us, that this is the end or use of pain. For, though great light be insufferable to our eyes, yet the highest degree of darkness does not at all disease them: because that, causing no disorderly motion in it, leaves that curious organ unharmed in its natural state. But yet excess of cold as well as heat pains us: because 'tis equally destructive to that temper which is necessary to the preservation of life, and the exercise of the several functions of the body, and which consists in a moderate degree of warmth; or, if you please, a motion of the insensible parts of our bodies, confined within certain bounds.

§5. Beyond all this, we may find another reason why God hath scattered up and down several degrees of pleasure and pain, in all the things that environ and affect us; and blended them together in almost all that our thoughts and senses have to do with; that we finding imperfection, dissatisfaction, and want of complete happiness, in all the enjoyments which the creatures can afford us, might be led to seek it in the enjoyment of him 'with whom there is fullness of joy, and at whose right hand are pleasures for evermore'.

§6. Though what I have here said may not, perhaps, make the ideas of pleasure and pain clearer to us than our own experience does, which is the only way that we are capable of having them; yet the consideration of the reason why they are annexed to so many other ideas, serving to give us due sentiments of the wisdom and goodness of the Sovereign Disposer of all things, may not be unsuitable to the main end of these inquiries: the knowledge and veneration of him being the chief end of all our thoughts, and the proper business of all understandings.

§7. Existence and unity. Existence and Unity are two other ideas that are suggested to the understanding, by every object without, and every idea within. When ideas are in our minds, we consider them as

being actually there, as well as we consider things to be actually without us; which is, that they exist, or have existence. And whatever we can consider as one thing, whether a real being or idea, suggests to the understanding the idea of unity.

§8. Idea of power. Power also is another of those simple ideas which we receive from sensation and reflection. For, observing in ourselves that we do and can think, and that we can at pleasure move several parts of our bodies, which were at rest; the effects, also, that natural bodies are able to produce in one another, occurring every moment to our senses, we both these ways get the idea of power.

§9. Succession. Besides these, there is another idea, which though suggested by our senses, yet is more constantly offered to us, by what passes in our minds; and that is the idea of succession. For if we look immediately into ourselves, and reflect on what is observable there, we shall find our ideas always, whilst we are awake, or have any thought, passing in train, one going and another coming, without intermission.

§10. Simple ideas the materials of all our knowledge. These, if they are not all, are at least (as I think) the most considerable of those simple ideas which the mind has, and out of which is made all its other knowledge; all which it receives only by the two forementioned ways of sensation and reflection.

Nor let any one think these too narrow bounds for the capacious mind of man to expatiate in, which takes its flight further than the stars, and cannot be confined by the limits of the world; that extends its thoughts often even beyond the utmost expansion of matter, and makes excursions into that incomprehensible inane. I grant all this, but desire any one to assign any simple idea which is not received from one of those inlets before mentioned, or any complex idea not made out of those simple ones. Nor will it be so strange to think these few simple ideas sufficient to employ the quickest thought, or largest capacity; and to furnish the materials of all that various knowledge, and more various fancies and opinions of all mankind, if we consider how many words may be made out of the various composition of twenty-four letters; or if, going one step further, we will but reflect on the variety of combinations that may be made with barely one of the above-mentioned ideas, viz. number, whose stock is inexhaustible, and truly infinite: and what a large and immense field, doth extension

Chapter VIII Some further Considerations concerning our Simple Ideas

§1. Positive ideas from privative causes. Concerning the simple ideas of Sensation, 'tis to be considered, that whatsoever is so constituted in nature as to be able, by affecting our senses, to cause any perception in the mind, doth thereby produce in the understanding a simple idea; which, whatever be the external cause of it, when it comes to be taken notice of, by our discerning faculty, 'tis by the mind looked on and considered, there to be a real positive idea in the understanding, as much as any other whatsoever; though, perhaps, the cause of it be but a privation of the subject.

§2. Thus the ideas of heat and cold, light and darkness, white and black, motion and rest, are equally clear and positive ideas in the mind; though, perhaps, some of the causes which produce them are barely privations, in those subjects, from whence our senses derive those ideas. These the understanding, in its view of them, considers all as distinct positive ideas, without taking notice of the causes that produce them: which is an inquiry not belonging to the idea, as 'tis in the understanding, but to the nature of the things existing without us. These are two very different things, and carefully to be distinguished; it being one thing to perceive and know the idea of white or black, and quite another to examine what kind of particles they must be, and how ranged in the superficies, to make any object appear white or black.

§3. A painter or dyer who never inquired into their causes hath the ideas of white and black, and other colours, as clearly, perfectly, and distinctly in his understanding, and perhaps more distinctly, than the philosopher, who hath busied himself in considering their natures, and thinks he knows how far either of them is, in its cause, positive or privative; and the idea of black is no less positive in his mind than that of white, however the cause of that colour in the external object may be only a privation.

§4. Why a privative cause in nature may occasion a positive idea. If it were the design of my present undertaking to inquire into the natural causes and manner of perception, I should offer this as a reason why a privative cause might, in some cases at least, produce a positive idea; viz. that all sensation being produced in us, only by different degrees and modes of motion in our animal spirits, variously agitated by external objects, the abatement of any former motion must as necessarily produce a new sensation as the variation or increase of it; and so introduce a new idea, which depends only on a different motion of the animal spirits in that organ.

§5. But whether this be so or not I will not here determine, but appeal to every one's own experience, whether the shadow of a man, though it consists of nothing but the absence of light (and the more the absence of light is, the more discernible is the shadow) does not, when a man looks on it, cause as clear and positive idea in his mind as a man himself, though covered over with clear sunshine'

And the picture of a shadow, is a positive thing. Indeed, we have

negative names, which stand not directly for positive ideas, but for their absence, such as insipid, silence, nihil, &c.; which words denote positive ideas, v.g. taste, sound, being, with a signification of their absence.

§6. And thus one may truly be said to see darkness. For, supposing a hole perfectly dark, from whence no light is reflected, 'tis certain one may see the figure of it, or it may be painted; or whether the ink I write with makes any other idea, is a question. The privative causes I have here assigned of positive ideas are according to the common opinion; but, in truth, it will be hard to determine whether there be really any ideas from a privative cause, till it be determined, whether rest be any more a privation than motion.

§7. Ideas in the mind, qualities in bodies. To discover the nature of our ideas the better, and to discourse of them intelligibly, it will be convenient to distinguish them as they are ideas or perceptions in our minds; and as they are modifications of matter in the bodies that cause such perceptions in us: that so we may not think (as perhaps usually is done) that they are exactly the images and resemblances of something inherent in the subject; most of those of sensation being in the mind no more the likeness of something existing without us, than the names that stand for them are the likeness of our ideas, which yet upon hearing they are apt to excite in us.

§8. Whatsoever the mind perceives in itself, or is the immediate object of perception, thought, or understanding, that I call idea; and the power to produce any idea in our mind, I call quality of the subject wherein that power is. Thus a snowball having the power to produce in us the ideas of white, cold, and round, the power to produce those ideas in us, as they are in the snowball, I call qualities; and as they are sensations or perceptions in our understandings, I call them ideas; which ideas, if I speak of sometimes as in the things themselves, I would be understood to mean those qualities in the objects which produce them in us.

§9. Primary qualities of bodies. Qualities thus considered in bodies are, first, such as are utterly inseparable from the body, in what state soever it be; and such as in all the alterations and changes it suffers, all the force can be used upon it, it constantly keeps; and such as sense constantly finds in every particle of matter which has bulk enough to be perceived; and the mind finds inseparable from

every particle of matter, though less than to make itself singly be perceived by our senses: v.g. take a grain of wheat, divide it into two parts; each part has still solidity, extension, figure, and mobility; divide it again, and it retains still the same qualities; and so divide it on, till the parts become insensible; they must retain still each of them all those qualities. For division (which is all that a mill, or pestle, or any other body, does upon another, in reducing it to insensible parts) can never take away either solidity, extension, figure, or mobility from any body, but only makes two or more distinct separate masses of matter, of that which was but one before; all which distinct masses, reckoned as so many distinct bodies, after division, make a certain number. These I call original or primary qualities of body, which I think we may observe to produce simple ideas in us, viz. solidity, extension, figure, motion or rest, and number.

§10. Secondly, such qualities which in truth are nothing in the objects themselves but power to produce various sensations in us by their primary qualities, i.e. by the bulk, figure, texture, and motion of their insensible parts, as colours, sounds, tastes, etc. These I call secondary qualities. To these might be added a third sort, which are allowed to be barely powers; though they are as much real qualities in the subject, as those which I, to comply with the common way of speaking, call qualities, but for distinction, secondary qualities. For the power in fire to produce a new colour, or consistency, in wax or clay, by its primary qualities, is as much a quality in fire, as the power it has to produce in me a new idea or sensation of warmth or burning, which I felt not before, by the same primary qualities, viz. the bulk, texture, and motion of its insensible parts.

§11. How primary qualities produce their ideas. The next thing to be considered is, how bodies produce ideas in us; and that is manifestly by impulse, the only way which we can conceive bodies to operate in.

§12. If then external objects be not united to our minds when they produce ideas therein; and yet we perceive these original qualities in such of them as singly fall under our senses, 'tis evident that some motion must be thence continued by our nerves, or animal spirits, by some parts of our bodies, to the brains or the seat of sensation, there to produce in our minds the particular ideas we have of them. And since the extension, figure, number, and motion of bodies of an

observable bigness, may be perceived at a distance by the sight, 'tis evident some singly imperceptible bodies must come from them to the eyes, and thereby convey to the brain some motion; which produces these ideas which we have of them in us.

§13. How secondary. After the same manner, that the ideas of these original qualities are produced in us, we may conceive that the ideas of secondary qualities are also produced, viz. by the operation of insensible particles on our senses. For, it being manifest, that there are bodies, and good store of bodies, each whereof are so small, that we cannot, by any of our senses, discover either their bulk, figure, or motion, as is evident in the particles of the air and water, and others extremely smaller than those; perhaps as much smaller than the particles of air and water, as the particles of air and water are smaller than peas or hail-stones; let us suppose at present that the different motions and figures, bulk and number, of such particles, affecting the several organs of our senses, produce in us those different sensations which we have from the colours and smells of bodies; v.g. that a violet, by the impulse of such insensible particles of matter, of peculiar figures, and bulks, and in different degrees and modifications of their motions, causes the ideas of the blue colour, and sweet scent of that flower to be produced in our minds. It being no more impossible, to conceive that God should annex such ideas to such motions, with which they have no similitude; than that he should annex the idea of pain to the motion of a piece of steel dividing our flesh, with which that idea hath no resemblance.

§14. What I have said concerning colours and smells may be understood also of tastes and sounds, and other the like sensible qualities; which, whatever reality we by mistake attribute to them, are in truth nothing in the objects themselves, but powers to produce various sensations in us; and depend on those primary qualities, viz. bulk, figure, texture, and motion of parts as I have said.

§15. Ideas of primary qualities are resemblances; of secondary, not. From whence I think it easy to draw this observation, that the ideas of primary qualities of bodies are resemblances of them, and their patterns do really exist in the bodies themselves, but the ideas produced in us by these secondary qualities, have no resemblance of them at all. There is nothing like our ideas, existing in the bodies themselves. They are in the bodies, we denominate from

them, only a power to produce those sensations in us: and what is sweet, blue, or warm in idea, is but the certain bulk, figure, and motion of the insensible parts, in the bodies themselves, which we call so.

§16. Flame is denominated hot and light; snow, white and cold; and manna, white and sweet, from the ideas they produce in us.

Which qualities are commonly thought to be the same in those bodies that those ideas are in us, the one the perfect resemblance of the other, as they are in a mirror, and it would by most men be judged very extravagant if one should say otherwise. And yet he, that will consider, that the same fire, that at one distance produces in us the sensation of warmth, does, at a nearer approach, produce in us the far different sensation of pain, ought to bethink himself, what reason he has to say, that this idea of warmth, which was produced in him by the fire, is actually in the fire; and his idea of pain, which the same fire produced in him the same way, is not in the fire. Why are whiteness and coldness in snow, and pain not, when it produces the one and the other idea in us; and can do neither, but by the bulk, figure, number, and motion of its solid parts?

§17. The particular bulk, number, figure, and motion of the parts of fire or snow are really in them, whether any one's senses perceive them or no: and therefore they may be called real qualities, because they really exist in those bodies. But light, heat, whiteness, or coldness, are no more really in them, than sickness or pain is in manna. Take away the sensation of them; let not the eyes see light, or colours, nor the ears hear sounds; let the palate not taste, nor the nose smell, and all colours, tastes, odours, and sounds, as they are such particular ideas, vanish and cease, and are reduced to their causes, i.e. bulk, figure, and motion of parts.

§18. A piece of manna of a sensible bulk is able to produce in us the idea of a round or square figure; and by being removed from one place to another, the idea of motion. This idea of motion represents it as it really is in the manna moving: a circle or square are the same, whether in idea or existence, in the mind or in the manna. And this, both motion and figure, are really in the manna, whether we take notice of them or no: this everybody is ready to agree to. Besides, manna, by its bulk, figure, texture, and motion of its parts, has a power to produce the sensations of sickness, and sometimes of acute

pains or gripings in us. That these ideas of sickness and pain are not in the manna, but effects of its operations on us, and are nowhere when we feel them not; this also every one readily agrees to. And yet men are hardly to be brought to think, that sweetness and whiteness are not really in manna; which are but the effects of the operations of manna, by the motion, size, and figure of its particles, on the eyes and palate: as the pain and sickness caused by manna are confessedly nothing, but the effects of its operations on the stomach and guts, by the size, motion, and figure of its insensible parts, (for by nothing else can a body operate, as has been proved): as if it could not operate on the eyes and palate, and thereby produce in the mind particular distinct ideas, which in itself it has not, as well as we allow it can operate on the guts and stomach, and thereby produce distinct ideas, which in itself it has not. These ideas, being all effects of the operations of manna on several parts of our bodies, by the size, figure number, and motion of its parts; why those produced by the eyes and palate should rather be thought to be really in the manna, than those produced by the stomach and guts; or why the pain and sickness, ideas that are the effect of manna, should be thought to be nowhere when they are not felt; and yet the sweetness and whiteness, effects of the same manna on other parts of the body, by ways equally as unknown, should be thought to exist in the manna, when they are not seen or tasted, would need some reason to explain.

§19. Let us consider the red and white colours in porphyry.

Hinder light from striking on it, and its colours vanish; it no longer produces any such ideas in us: upon the return of light it produces these appearances on us again. Can any one think any real alterations are made in the porphyry by the presence or absence of light; and that those ideas of whiteness and redness are really in porphyry in. the light, when 'tis plain it has no colour in the dark' It has, indeed, such a configuration of particles, both night and day, as are apt, by the rays of light rebounding from some parts of that hard stone, to produce in us the idea of redness, and from others the idea of whiteness; but whiteness or redness are not in it at any time, but such a texture that hath the power to produce such a sensation in us.

§20. Pound an almond, and the clear white colour will be altered into a dirty one, and the sweet taste into an oily one. What real alteration can the beating of the pestle make in any body, but an

alteration of the texture of it'

§21. Ideas being thus distinguished and understood, we may be able to give an account how the same water, at the same time, may produce the idea of cold by one hand and of heat by the other: whereas 'tis impossible that the same water, if those ideas were really in it, should at the same time be both hot and cold. For, if we imagine warmth, as 'tis in our hands, to be nothing but a certain sort and degree of motion in the minute particles of our nerves or animal spirits, we may understand how 'tis possible that the same water may, at the same time, produce the sensations of heat in one hand and cold in the other; which yet figure never does, that never producing the idea of a square by one hand which has produced the idea of a globe by another. But if the sensation of heat and cold be nothing but the increase or diminution of the motion of the minute parts of our bodies, caused by the corpuscles of any other body, 'tis easy to be understood, that if that motion be greater in one hand than in the other; if a body be applied to the two hands, which has in its minute particles a greater motion than in those of one of the hands, and a less than in those of the other, it will increase the motion of the one hand and lessen it in the other; and so cause the different sensations of heat and cold that depend thereon.

§22. I have in what just goes before, been engaged in physical inquiries a little further than perhaps I intended. But, it being necessary to make the nature of sensation a little understood; and to make the difference between the qualities in bodies, and the ideas produced by them in the mind, to be distinctly conceived, without which it were impossible to discourse intelligibly of them; I hope I shall be pardoned this little excursion into natural philosophy; it being necessary in our present inquiry, to distinguish the primary and real qualities of bodies, which are always in them (*viz.* solidity, extension, figure, number, and motion, or rest; and are sometimes perceived by us, *viz.* when the bodies they are in, are big enough singly to be discerned), from those secondary and imputed qualities, which are but the powers of several combinations of those primary ones, when they operate without being distinctly discerned; whereby we may also come to know what ideas are, and what are not, resemblances of something really existing in the bodies we denominate from them.

§23. Three sorts of qualities in bodies. The qualities then that are

in bodies, rightly considered, are of three sorts: First, the bulk, figure, number, situation, and motion, or rest of their solid parts; Those are in them, whether we perceive them or not; and when they are of that size that we can discover them, we have by these an idea of the thing as 'tis in itself, as is plain in artificial things. These I call primary qualities.

Secondly, the power that is in any body, by reason of its insensible primary qualities, to operate after a peculiar manner on any of our senses, and thereby produce in us the different ideas of several colours, sounds, smells, tastes, etc. These are usually called sensible qualities.

Thirdly, the power that is in any body, by reason of the particular constitution of its primary qualities, to make such a change in the bulk, figure, texture, and motion of another body, as to make it operate on our senses differently from what it did before. Thus the sun has a power to make wax white, and fire to make lead fluid. These are usually called powers.

The first of these, as has been said, I think, may be properly called real, original, or primary qualities, because they are in the things themselves, whether they are perceived or no; and upon their different modifications 'tis that the secondary qualities depend.

The other two, are only powers to act differently upon other things, which powers result from the different modifications of those primary qualities.

§24. The first are resemblances; the second thought to be resemblances, but are not; the third neither are nor are thought so. But though these two latter sorts of qualities are powers barely, and nothing but powers, relating to several other bodies, and resulting from the different modifications of the original qualities, yet they are generally otherwise thought of. For the second sort, viz, the powers to produce several ideas in us, by our senses, are looked upon as real qualities, in the things thus affecting us: but the third sort are called, and esteemed barely powers. v.g. the idea of heat or light, which we receive by our eyes, or touch, from the sun, are commonly thought real qualities, existing in the sun, and something more than mere powers in it. But when we consider the sun, in reference to wax, which it melts or blanches, we look on the whiteness and softness produced in

the wax, not as qualities in the sun, but effects produced by powers in it. Whereas, if rightly considered, these qualities of light and warmth, which are perceptions in me when I am warmed, or enlightened by the sun, are no otherwise in the sun, than the changes made in the wax, when 'tis blanced or melted, are in the sun. They are all of them equally powers in the sun, depending on its primary qualities; whereby 'tis able, in the one case, so to alter the bulk, figure, texture, or motion of some of the insensible parts of my eyes, or hands, as thereby to produce in me the idea of light or heat; and in the other, 'tis able so to alter the bulk, figure, texture, or motion of the insensible parts of the wax, as to make them fit to produce in me the distinct ideas of white and fluid.

§25. The reason, why the one are ordinarily taken for real qualities, and the other only for bare powers, seems to be, because the ideas we have of distinct colours, sounds, etc., containing nothing at all in them of bulk, figure, or motion, we are not apt to think them the effects of these primary qualities; which appear not, to our senses, to operate in their production, and with which they have not any apparent congruity or conceivable connexion. Hence 'tis that we are so forward to imagine, that those ideas are the resemblances of something really existing in the objects themselves: since sensation discovers nothing of bulk, figure, or motion of parts in their production; nor can reason show how bodies, by their bulk, figure, and motion, should produce in the mind the ideas of blue or yellow, etc. But, in the other case, in the operations of bodies changing the qualities one of another, we plainly discover that the quality produced hath commonly no resemblance with anything in the thing producing it; wherefore we look on it as a bare effect of power. For, through receiving the idea of heat or light from the sun, we are apt to think 'tis a perception and resemblance of such a quality in the sun: yet when we see wax, or a fair face, receive change of colour from the sun, we cannot imagine that to be the reception or resemblance of anything in the sun, because we find not those different colours in the sun itself. For our senses, being able to observe a likeness, or unlikeness of sensible qualities in two different external objects, we forwardly enough conclude the production of any sensible quality in any subject, to be an effect of bare power, and not the communication of any quality, which was really in the efficient, when we find no such sensible quality in the thing that produced it. But our senses, not being able to discover any unlikeness between the idea produced in

us, and the quality of the object producing it, we are apt to imagine that our ideas are resemblances of something in the objects, and not the effects of certain powers, placed in the modification of their primary qualities, with which primary qualities the ideas produced in us have no resemblance.

§26. Secondary qualities twofold; first, immediately perceivable; secondly, mediately perceivable. To conclude. Besides those beforementioned primary qualities in bodies, viz. bulk, figure, extension, number, and motion of their solid parts; all the rest, whereby we take notice of bodies, and distinguish them one from another, are nothing else but several powers in them, depending on those primary qualities; whereby they are fitted, either by immediately operating on our bodies to produce several different ideas in us; or else, by operating on other bodies, so to change their primary qualities as to render them capable of producing ideas in us different from what before they did. The former of these, I think, may be called secondary qualities immediately perceivable: the latter, secondary qualities, mediately perceivable.

Chapter IX Of Perception

§1. 'Tis the first simple idea of reflection. Perception, as 'tis the first faculty of the mind exercised about our ideas; so 'tis the first and simplest idea we have from reflection, and is by some called thinking in general. Though thinking, in the propriety of the English tongue, signifies that sort of operation in the mind about its ideas, wherein the mind is active; where it, with some degree of voluntary attention, considers anything. For in bare naked perception, the mind is, for the most part, only passive; and what it perceives, it cannot avoid perceiving.

§2. Perception is only when the mind receives the impression. What perception is, every one will know better by reflecting on what he does himself, when he sees, hears, feels, etc., or thinks, than by any discourse of mine. Who-ever reflects on what passes in his own mind cannot miss it: and if he does not reflect, all the words in the world cannot make him have any notion of it.

§3. This is certain, that whatever alterations are made in the body, if they reach not the mind; whatever impressions are made on

the outward parts, if they are not taken notice of within, there is no perception. Fire may burn our bodies, with no other effect, than it does a billet, unless the motion be continued to the brain, and there the sense of heat, or idea of pain, be produced in the mind; wherein consists actual perception.

§4. Impulse on the organ insufficient. How often may a man observe in himself, that whilst his mind is intently employed in the contemplation of some objects, and curiously surveying some ideas that are there, it takes no notice of impressions of sounding bodies made upon the organ of hearing, with the same alteration, that uses to be for the producing the idea of sound? A sufficient impulse there may be on the organ; but it not reaching the observation of the mind, there follows no perception: and though the motion that uses to produce the idea of sound, be made in the ear, yet no sound is heard. Want of sensation in this case, is not through any defect in the organ, or that the man's ears are less affected, than at other times, when he does hear: but that which uses to produce the idea, though conveyed in by the usual organ, not being taken notice of in the understanding, and so imprinting no idea in the mind, there follows no sensation. So that wherever there is sense or perception, there some idea is actually produced, and present in the understanding.

§5. Children, though they may have ideas in the womb, have none innate. Therefore I doubt not but children, by the exercise of their senses about objects, that affect them in the womb, receive some few ideas before they are born, as the unavoidable effects, either of the bodies that environ them, or else of those wants or diseases they suffer; amongst which (if one may conjecture concerning things not very capable of examination) I think the ideas of hunger and warmth are two: which probably are some of the first that children have, and which they scarce ever part with again.

§6. The effects of sensation in the womb. But though it be reasonable to imagine, that children receive some ideas before they come into the world, yet these simple ideas are far from those innate principles, which some contend for, and we, above, have rejected.

These here mentioned, being the effects of sensation, are only from some affections of the body, which happen to them there, and so depend on something exterior to the mind; no otherwise differing in their manner of production from other ideas derived from sense, but

only in the precedence of time: Whereas those innate principles are supposed to be quite of another nature; not coming into the mind by any accidental alterations in, or operations on the body; but, as it were, original characters impressed upon it, in the very first moment of its being and constitution.

§7. Which ideas appear first, is not evident. As there are some ideas which we may reasonably suppose may be introduced into the minds of children in the womb, subservient to the necessities of their life and being there: so, after they are born, those ideas are the earliest imprinted which happen to be the sensible qualities which first occur to them; amongst which light is not the least considerable, nor of the weakest efficacy. And how covetous the mind is, to be furnished with all such ideas as have no pain accompanying them, may be a little guessed by what is observable in children new-born; who always turn their eyes to that part from whence the light comes, lay them how you please. But the ideas that are most familiar at first, being various according to the divers circumstances of children's first entertainment in the world, the order, wherein the several ideas come at first into the mind is very various, and uncertain also; neither is it much material to know it.

§8. Ideas of sensations often changed by the judgment. We are further to consider concerning perception, that the ideas we receive by sensation are often, in grown people altered by the judgment, without our taking notice of it. When we set before our eyes a round globe of any uniform colour, v.g. gold, alabaster, or jet, 'tis certain that the idea thereby imprinted on our mind is of a flat circle, variously shadowed, with several degrees of light and brightness coming to our eyes. But we having, by use, been accustomed to perceive what kind of appearance convex bodies are wont to make in us; what alterations are made in the reflections of light, by the difference of the sensible figures of bodies, the judgment presently, by an habitual custom, alters the appearances into their causes: So that from that which is truly variety of shadow or colour, collecting the figure, it makes it pass for a mark of figure, and frames to itself the perception of a convex figure and an uniform colour; when the idea we receive from thence is only a plane variously coloured, as is evident in painting. To which purpose I shall here insert a problem of that very ingenious and studious promoter of real knowledge, the learned and worthy Mr Molyneux, which he was pleased to send me in a letter some months

since; and 'tis this: 'Suppose a man born blind, and now adult, and taught by his touch to distinguish between a cube and a sphere of the same metal, and nighly of the same bigness, so as to tell, when he felt one and the other, which is the cube, which the sphere. Suppose then the cube and sphere placed on a table, and the blind man be made to see: Qu're, whether by his sight, before he touched them, he could now distinguish and tell which is the globe, which the cube.' To which the acute and judicious proposer answers, 'Not. For, though he has obtained the experience of how a globe, how a cube affects his touch, yet he has not yet obtained the experience, that what affects his touch so or so, must affect his sight so or so; or that a protuberant angle in the cube, that pressed his hand unequally, shall appear to his eye as it does in the cube.' I agree with this thinking gentleman, whom I am proud to call my friend, in his answer to this problem; and am of opinion that the blind man, at first sight, would not be able with certainty to say, which was the globe, which the cube, whilst he only saw them; though he could unerringly name them by his touch, and certainly distinguish them by the difference of their figures felt. This I have set down, and leave with my reader, as an occasion for him to consider how much he may be beholden to experience, improvement, and acquired notions, where he thinks, he had not the least use of, or help from them: and the rather, because this observing gentleman further adds, that 'having, upon the occasion of my book, proposed this to divers very ingenious men, he hardly ever met with one, that at first gave the answer to it which he thinks true, till by hearing his reasons they were convinced.'

§9. But this is not, I think, usual in any of our ideas, but those received by sight. Because sight, the most comprehensive of all our senses, conveying to our minds the ideas of light and colours, which are peculiar only to that sense; and also the far different ideas of space, figure, and motion, the several varieties whereof change the appearances of its proper object, viz. light and colours; we bring ourselves by use to judge of the one by the other. This, in many cases by a settled habit, in things whereof we have frequent experience, is performed so constantly and so quick, that we take that for the perception of our sensation which is an idea formed by our judgment; so that one, viz. that of sensation, serves only to excite the other, and is scarce taken notice of itself; as a man who reads or hears with attention and understanding, takes little notice of the characters or sounds, but of the ideas that are excited in him by them.

§10. Nor need we wonder, that this is done with so little notice, if we consider, how very quick the actions of the mind are performed: For, as itself is thought to take up no space, to have no extension; so its actions seem to require no time, but many of them seem to be crowded into an instant. I speak this in comparison to the actions of the body. Any one may easily observe this in his own thoughts, who will take the pains to reflect on them. How, as it were in an instant, do our minds, with one glance, see all the parts of a demonstration, which may very well be called a long one, if we consider the time it will require to put it into words, and step by step show it another

Secondly, we shall not be so much surprised that this is done in us with so little notice, if we consider how the facility which we get of doing things, by a custom of doing, makes them often pass in us without our notice. Habits, especially such as are begun very early, come at last to produce actions in us, which often escape our observation. How frequently do we, in a day, cover our eyes with our eyelids, without perceiving that we are at all in the dark! Men that by custom have got the use of a by-word, do almost in every sentence pronounce sounds which, though taken notice of by others, they themselves neither hear nor observe. And therefore 'tis not so strange, that our mind should often change the idea of its sensation into that of its judgment, and make one serve only to excite the other, without our taking notice of it.

§11. Perception puts the difference between animals and vegetables. This faculty of perception seems to me to be, that which puts the distinction betwixt the animal kingdom and the inferior parts of nature. For, however vegetables have, many of them, some degrees of motion, and upon the different application of other bodies to them, do very briskly alter their figures and motions, and so have obtained the name of sensitive plants, from a motion which has some resemblance to that which in animals follows upon sensation: yet I suppose 'tis all bare mechanism; and no otherwise produced than the turning of a wild oat-beard, by the insinuation of the particles of moisture, or the shortening of a rope, by the affusion of water. All which is done without any sensation in the subject, or the having or receiving any ideas.

§12. Perception, I believe, is, in some degree, in all sorts of

animals; though in some, possibly, the avenues provided by nature for the reception of sensations are so few, and the perception they are received with so obscure and dull, that it comes extremely short of the quickness and variety of sensation, which is in other animals: but yet 'tis sufficient for, and wisely adapted to, the state and condition of that sort of animals who are thus made: so that the wisdom and goodness of the Maker plainly appear in all the parts of this stupendous fabric, and all the several degrees and ranks of creatures in it.

§13. We may, I think, from the make of an oyster or cockle, reasonably conclude that it has not so many, nor so quick senses as a man, or several other animals; nor if it had, would it, in that state and incapacity of transferring itself from one place to another, be bettered by them. What good would sight and hearing do to a creature that cannot move itself to or from the objects wherein at a distance it perceives good or evil? And would not quickness of sensation be an inconvenience to an animal that must lie still where chance has once placed it, and there receive the afflux of colder or warmer, clean or foul water, as it happens to come to it?

§14. Decay of perception in old age. But yet I cannot but think there is some small dull perception, whereby they are distinguished from perfect insensibility. And that this may be so, we have plain instances, even in mankind itself. Take one in whom decrepit old age has blotted out the memory of his past knowledge, and clearly wiped out the ideas his mind was formerly stored with; and has, by destroying his sight, hearing, and smell quite, and his taste to a great degree, stopped up almost all the passages for new ones to enter; or if there be some of the inlets yet half open, the impressions made are scarcely perceived, or not at all retained. How far such an one (notwithstanding all that is boasted of innate principles) is in his knowledge and intellectual faculties above the condition of a cockle or an oyster, I leave to be considered. And if a man had passed sixty years in such a state, as 'tis possible he might, as well as three days, I wonder what difference there would have been, in any intellectual perfections, between him and the lowest degree of animals.

§15. Perception the inlet of knowledge. Perception then being the first step and degree towards knowledge, and the inlet of all the materials of it; the fewer senses any man, as well as any other

creature, hath; and the fewer and duller the impressions are that are made by them, and the duller the faculties are that are employed about them, the more remote are they from that knowledge which is to be found in some men. But this being in great variety of degrees (as may be perceived amongst men) cannot certainly be discovered in the several species of animals, much less in their particular individuals. It suffices me only to have remarked here, that perception is the first operation of all our intellectual faculties, and the inlet of all knowledge in our minds. And I am apt too to imagine, that 'tis perception in the lowest degree of it, which puts the boundaries between animals, and the inferior ranks of creatures. But this I mention only as my conjecture by the by; it being indifferent to the matter in hand, which way the learned shall determine of it.

Chapter X Of Retention

§1. Contemplation. The next faculty of the mind, whereby it makes a further progress towards knowledge, is that which I call retention; or the keeping of those simple ideas, which from sensation or reflection it hath received. This is done two ways. First, by keeping the idea, which is brought into it, for some time actually in view, which is called contemplation.

§2. Memory. The other way of retention is the power to revive again in our minds those ideas, which after imprinting, have disappeared, or have been as it were laid aside out of sight: and thus we do, when we conceive heat or light, yellow or sweet, the object being removed. This is memory, which is as it were the storehouse of our ideas. For the narrow mind of man, not being capable of having many ideas under view and consideration at once, it was necessary to have a repository, to lay up those ideas which at another time, it might have use of. But our ideas being nothing but actual perceptions in the mind, which cease to be anything when there is no perception of them; this laying up of our ideas in the repository of the memory signifies no more but this, that the mind has a power, in many cases to revive perceptions which it has once had, with this additional perception annexed to them, that it has had them before. And in this sense 'tis that our ideas are said to be in our memories, when indeed they are actually nowhere; but only there is an ability in the mind when it will to revive them again, and as it were paint them anew on itself, though some with more, some with less difficulty; some more

lively, and others more obscurely. And thus 'tis, by the assistance of this faculty, that we are said to have all those ideas in our understandings which, though we do not actually contemplate, yet we can bring in sight, and make appear again, and be the objects of our thoughts, without the help of those sensible qualities which first imprinted them there.

§3. Attention, repetition, pleasure and pain, fix ideas. Attention and repetition help much to the fixing any ideas in the memory: But those, which naturally at first make the deepest and most lasting impressions, are those, which are accompanied with pleasure or pain. The great business of the senses, being to make us take notice of what hurts or advantages the body, 'tis wisely ordered by nature,(as has been shown), that pain should accompany the reception of several ideas; which, supplying the place of consideration and reasoning in children, and acting quicker than consideration in grown men, makes both the old and young avoid painful objects with that haste which is necessary for their preservation; and in both settles in the memory a caution for the future.

§4. Ideas fade in the memory. Concerning the several degrees of lasting, wherewith ideas are imprinted on the memory, we may observe, that some of them have been produced in the understanding by an object affecting the senses once only, and no more than once:others, that have more than once offered themselves to the senses,have yet been little taken notice of; the mind, either heedless, as in children, or otherwise employed, as in men, intent only on one thing,not setting the stamp deep into itself. And in some, where they are set on with care and repeated impressions, either through the temper of the body, or some other fault, the memory is very weak. In all these cases, ideas in the mind quickly fade, and often vanish quite out of the understanding, leaving no more footsteps or remaining characters of themselves than shadows do flying over fields of corn,and the mind is as void of them as if they had never been there.

§5. Thus many of those ideas which were produced in the minds of children, in the beginning of their sensation, (some of which perhaps, as of some pleasures and pains, were before they were born, and others in their infancy) if the future course of their lives they are not repeated again, are quite lost, without the least glimpse remaining of them. This may be observed in those, who by some mischance have

lost their sight, when they were very young, in whom the ideas of colours, having been but slightly taken notice of, and ceasing to be repeated, do quite wear out; so that some years after, there is no more notion nor memory of colours left in their minds, than in those of people born blind. The memory of some men, 'tis true, is very tenacious, even to a miracle. But yet there seems to be a constant decay of all our ideas, even of those which are struck deepest, and in minds the most retentive; so that if they be not sometimes renewed, by repeated exercise of the senses, or reflection on those kinds of objects which at first occasioned them, the print wears out, and at last there remains nothing to be seen. Thus the ideas, as well as children, of our youth, often die before us: and our minds represent to us those tombs to which we are approaching; where, though the brass and marble remain, yet the inscriptions are effaced by time, and the imagery moulders away. The pictures drawn in our minds are laid in fading colours; and if not sometimes refreshed, vanish and disappear. How much the constitution of our bodies, and the make of our animal spirits, are concerned in this, and whether the temper of the brain makes this difference, that in some it retains the characters drawn on it like marble, in others like freestone, and in others little better than sand, I shall not here inquire; though it may seem probable that the constitution of the body does sometimes influence the memory, since we oftentimes find a disease quite strip the mind of all its ideas, and the flames of a fever in a few days calcine all those images to dust and confusion, which seemed to be as lasting as if graved in marble.

§6. Constantly repeated ideas can scarce be lost. But concerning the ideas themselves, 'tis easy to remark, that those that are oftenest refreshed (amongst which are those that are conveyed into the mind by more ways than one) by a frequent return of the objects or actions that produce them, fix themselves best in the memory, and remain clearest and longest there; and therefore those which are of the original qualities of bodies, viz. solidity, extension, figure, motion, and rest; and those that almost constantly affect our bodies, as heat and cold; and those which are the affections of all kinds of beings, as existence, duration, and number, which almost every object that affects our senses, every thought which employs our minds, bring along with them; these, I say, and the like ideas, are seldom quite lost, whilst the mind retains any ideas at all.

§7. In remembering, the mind is often active. In this secondary

perception, as I may so call it, or viewing again the ideas that are lodged in the memory, the mind is oftentimes more than barely passive; the appearance of those dormant pictures depending sometimes on the will.

The mind very often sets itself on work in search of some hidden idea, and turns as it were the eye of the soul upon it; though sometimes too they start up in our minds of their own accord, and offer themselves to the understanding; and very often are roused and tumbled out of their dark cells, into open daylight, by some turbulent and tempestuous passions; our affections bringing ideas to our memory which had otherwise lain quiet and unregarded. This further is to be observed, concerning ideas lodged in the memory, and upon occasion revived by the mind, that they are not only (as the word revive imports) none of them new ones, but also that the mind takes notice of them, as of a former impression, and renews its acquaintance with them, as with ideas it had known before. So that though ideas formerly imprinted are not all constantly in view, yet in remembrance they are constantly known to be such as have been formerly imprinted; i.e. in view, and taken notice of before, by the understanding.

§8. Two defects in the memory, oblivion and slowness. Memory, in an intellectual creature, is necessary in the next degree to perception. 'Tis of so great moment, that where 'tis wanting, all the rest of our faculties are in a great measure useless: And we in our thoughts, reasonings, and knowledge, could not proceed beyond present objects, were it not for the assistance of our memories; wherein there may be two defects.

First, That it loses the idea quite, and so far it produces perfect ignorance. For since we can know nothing further than we have the idea of it, when that is gone, we are in perfect ignorance.

Secondly, that it moves slowly, and retrieves not the ideas that it has, and are laid up in store, quick enough to serve the mind upon occasion. This, if it be to a great degree, is stupidity; and he who, through this default in his memory, has not the ideas that are really preserved there, ready at hand when need and occasion calls for them, were almost as good be without them quite, since they serve him to little purpose. The dull man, who loses the opportunity, whilst he is seeking in his mind for those ideas that should serve his turn, is

not much more happy in his knowledge than one that is perfectly ignorant. 'Tis the business therefore of the memory to furnish to the mind those dormant ideas which it has present occasion for; in the having them ready at hand on all occasions, consists that which we call invention, fancy, and quickness of parts.

§9. These are defects we may observe, in the memory of one man compared with another. There is another defect, which we may conceive to be in the memory of man in general, compared with some superior created intellectual beings, which in this faculty may so far excel man, that they may have constantly in view the whole scene of all their former actions, wherein no one of the thoughts they have ever had, may slip out of their sight. The omniscience of God, who knows all things, past, present, and to come, and to whom the thoughts of men's hearts always lie open, may satisfy us of the possibility of this. For who can doubt but God may communicate to those glorious spirits, his immediate attendants, any of his perfections, in what proportions he pleases, as far as created finite beings can be capable. 'Tis reported of that prodigy of parts, Monsieur Pascal, that till the decay of his health had impaired his memory, he forgot nothing of what he had done, read, or thought, in any part of his rational age. This is a privilege so little known to most men, that it seems almost incredible to those who, after the ordinary way, measure all others by themselves; but yet, when considered, may help us to enlarge our thoughts towards greater perfections of it in superior ranks of spirits. For this of Monsieur Pascal was still with the narrowness that human minds are confined to here, of having great variety of ideas only by succession, not all at once. Whereas the several degrees of angels may probably have larger views; and some of them be endowed with capacities able to retain together, and constantly set before them, as in one picture, all their past knowledge at once. This, we may conceive, would be no small advantage to the knowledge of a thinking man, if all his past thoughts and reasonings could be always present to him. And therefore we may suppose it one of those ways, wherein the knowledge of separate spirits may exceedingly surpass ours.

§10. Brutes have memory. This faculty of laying up and retaining the ideas that are brought into the mind, several other animals seem to have to a great degree, as well as man. For, to pass by other instances, birds learning of tunes, and the endeavours one may

observe in them to hit the notes right, put it past doubt with me, that they have perception, and retain ideas in their memories, and use them for patterns. For it seems to me impossible that they should endeavour to conform their voices to notes (as 'tis plain they do) of which they had no ideas. For, though I should grant sound may mechanically cause a certain motion of the animal spirits in the brains of those birds, whilst the tune is actually playing; and that motion may be continued on to the muscles of the wings, and so the bird mechanically be driven away by certain noises, because this may tend to the bird's preservation; yet that can never be supposed a reason why it should cause mechanically either whilst the tune is playing, much less after it has ceased such a motion of the organs in the bird's voice as should conform it to the notes of a foreign sound, which imitation can be of no use to the bird's preservation. But, which is more, it cannot with any appearance of reason be supposed (much less proved) that birds, without sense and memory, can approach their notes nearer and nearer by degrees to a tune played yesterday; which if they have no idea of in their memory, is now nowhere, nor can be a pattern for them to imitate, or which any repeated essays can bring them nearer to. Since there is no reason why the sound of a pipe should leave traces in their brains, which, not at first, but by their afterendeavours, should produce the like sounds; and why the sounds they make themselves, should not make traces which they should follow, as well as those of the pipe, is impossible to conceive.

Chapter XI Of Discerning, and other Operations of the Mind

§1. No knowledge without it. Another faculty, we may take notice of in our minds is that of discerning and distinguishing between the several ideas it has. 'Tis not enough to have a confused perception of something in general. Unless the mind had a distinct perception of different objects and their qualities, it would be capable of very little knowledge, though the bodies that affect us were as busy about us as they are now, and the mind were continually employed in thinking.

On this faculty of distinguishing one thing from another depends the evidence and certainty of several, even very general, propositions, which have passed for innate truths; because men, overlooking the true cause why those propositions find universal

assent, impute it wholly to native uniform impressions; whereas it in truth depends upon this clear discerning faculty of the mind, whereby it perceives two ideas to be the same, or different. But of this more hereafter.

§2. The difference of wit and judgment. How much the imperfection of accurately discriminating ideas one from another lies, either in the dulness or faults of the organs of sense; or want of acuteness, exercise, or attention in the understanding; or hastiness and precipitancy, natural to some tempers, I will not here examine: it suffices to take notice, that this is one of the operations that the mind may reflect on and observe in itself. 'Tis of that consequence to its other knowledge, that so far as this faculty is in itself dull, or not rightly made use of, for the distinguishing one thing from another, so far our notions are confused, and our reason and judgment disturbed or misled. If in having our ideas in the memory ready at hand consists quickness of parts; in this, of having them unconfused, and being able nicely to distinguish one thing from another, where there is but the least difference, consists, in a great measure, the exactness of judgment, and clearness of reason, which is to be observed in one man above another. And hence perhaps may be given some reason of that common observation, that men who have a great deal of wit, and prompt memories, have not always the clearest judgment or deepest reason. For wit lying most in the assemblage of ideas, and putting those together with quickness and variety, wherein can be found any resemblance or congruity, thereby to make up pleasant pictures and agreeable visions in the fancy; judgment, on the contrary, lies quite on the other side, in separating carefully, one from another, ideas wherein can be found the least difference, thereby to avoid being misled by similitude, and by affinity to take one thing for another. This is a way of proceeding quite contrary to metaphor and allusion; wherein for the most part lies that entertainment and pleasantry of wit, which strikes so lively on the fancy, and therefore is so acceptable to all people, because its beauty appears at first sight, and there is required no labor of thought to examine what truth or reason there is in it. The mind, without looking any further, rests satisfied with the agreeableness of the picture and the gaiety of the fancy. And 'tis a kind of affront to go about to examine it, by the severe rules of truth and good reason; whereby it appears that it consists in something that is not perfectly conformable to them.

§3. Clearness done hinders confusion. To the well distinguishing our ideas, it chiefly contributes that they be clear and determinate. And when they are so, it will not breed any confusion or mistake about them, though the senses should (as sometimes they do) convey them from the same object differently on different occasions, and so seem to err. For, though a man in a fever should from sugar have a bitter taste, which at another time would produce a sweet one, yet the idea of bitter in that man's mind would be as clear and distinct from the idea of sweet as if he had tasted only gall. Nor does it make any more confusion between the two ideas of sweet and bitter, that the same sort of body produces at one time one, and at another time another idea by the taste, than it makes a confusion in two ideas of white and sweet, or white and round, that the same piece of sugar produces them both in the mind at the same time. And the ideas of orangecolour and azure, that are produced in the mind by the same parcel of the infusion of *lignum nephriticum*, are no less distinct ideas than those of the same colours taken from two very different bodies.

§4. Comparing. The comparing them one with another, in respect of extent, degrees, time, place, or any other circumstances, is another operation of the mind about its ideas, and is that upon which depends all that large tribe of ideas comprehended under relation; which, of how vast an extent 'tis, I shall have occasion to consider hereafter.

§5. Brutes compare but imperfectly. How far brutes partake in this faculty, is not easy to determine. I imagine they have it not in any great degree: for though they probably have several ideas distinct enough, yet it seems to me to be the prerogative of human understanding, when it has sufficiently distinguished any ideas, so as to perceive them to be perfectly different, and so consequently two, to cast about and consider in what circumstances they are capable to be compared. And therefore, I think, beasts compare not their ideas further than some sensible circumstances annexed to the objects themselves. The other power of comparing, which may be observed in men, belonging to general ideas, and useful only to abstract reasonings, we may probably conjecture beasts have not.

§6. Compounding. The next operation we may observe in the mind about its ideas is composition; whereby it puts together several of those simple ones it has received from sensation and reflection, and combines them into complex ones. Under this of composition may be

reckoned also that of enlarging, wherein, though the composition does not so much appear as in more complex ones, yet 'tis nevertheless a putting several ideas together, though of the same kind. Thus, by adding several units together, we make the idea of a dozen; and putting together the repeated ideas of several perches, we frame that of a furlong.

§7. Brutes compound but little. In this also, I suppose, brutes come far short of man. For, though they take in, and retain together, several combinations of simple ideas, as possibly the shape, smell, and voice of his master make up the complex idea a dog has of him, or rather are so many distinct marks whereby he knows him; yet I do not think they do of themselves ever compound them and make complex ideas. And perhaps even where we think they have complex ideas, 'tis only one simple one that directs them in the knowledge of several things, which possibly they distinguish less by their sight than we imagine. For I have been credibly informed that a bitch will nurse, play with, and be fond of young foxes, as much as, and in place of her puppies, if you can but get them once to suck her so long that her milk may go through them. And those animals which have a numerous brood of young ones at once, appear not to have any knowledge of their number; for though they are mightily concerned for any of their young that are taken from them whilst they are in sight or hearing, yet if one or two of them be stolen from them in their absence, or without noise, they appear not to miss them, or to have any sense that their number is lessened.

§8. Naming. When children have, by repeated sensations, got ideas fixed in their memories, they begin by degrees to learn the use of signs. And when they have got the skill to apply the organs of speech to the framing of articulate sounds, they begin to make use of words, to signify their ideas to others. These verbal signs they sometimes borrow from others, and sometimes make themselves, as one may observe among the new and unusual names children often give to things in the first use of language.

§9. Abstraction. The use of words then being to stand as outward marks of our internal ideas, and those ideas being taken from particular things, if every particular idea that we take in should have a distinct name, names must be endless. To prevent this, the mind makes the particular ideas received from particular objects to become

general; which is done by considering them as they are in the mind such appearances, separate from all other existences, and the circumstances of real existence, as time, place, or any other concomitant ideas. This is called abstraction, whereby ideas taken from particular beings become general representatives of all of the same kind; and their names general names, applicable to whatever exists conformable to such abstract ideas. Such precise, naked appearances in the mind, without considering how, whence, or with what others they came there, the understanding lays up (with names commonly annexed to them) as the standards to rank real existences into sorts, as they agree with these patterns, and to denominate them accordingly. Thus the same colour being observed today in chalk or snow, which the mind yesterday received from milk, it considers that appearance alone, makes it a representative of all of that kind; and having given it the name whiteness, it by that sound signifies the same quality wheresoever to be imagined or met with; and thus universals, whether ideas or terms, are made.

§10. Brutes abstract not. If it may be doubted whether beasts compound and enlarge their ideas that way to any degree; this, I think, I may be positive in, that the power of abstracting is not at all in them; and that the having of general ideas is that which puts a perfect distinction betwixt man and brutes, and is an excellency which the faculties of brutes do by no means attain to. For 'tis evident we observe no footsteps in them of making use of general signs for universal ideas; from which we have reason to imagine that they have not the faculty of abstracting, or making general ideas, since they have no use of words, or any other general signs.

§11. Nor can it be imputed to their want of fit organs to frame articulate sounds, that they have no use or knowledge of general words; since many of them, we find, can fashion such sounds, and pronounce words distinctly enough, but never with any such application. And, on the other side, men who, through some defect in the organs, want words, yet fail not to express their universal ideas by signs, which serve them instead of general words, a faculty which we see beasts come short in. And, therefore, I think, we may suppose, that 'tis in this that the species of brutes are discriminated from man; and 'tis that proper difference wherein they are wholly separated, and which at last widens to so vast a distance. For if they have any ideas at all, and are not bare machines, (as some would have them,) we

cannot deny them to have some reason. It seems as evident to me, that they do some of them in certain instances reason, as that they have sense; but 'tis only in particular ideas, just as they received them from their senses. They are the best of them tied up within those narrow bounds, and have not (as I think) the faculty to enlarge them by any kind of abstraction.

§12. Idiots and madmen. How far idiots are concerned in the want or weakness of any, or all of the foregoing faculties, an exact observation of their several ways of faltering would no doubt discover. For those who either perceive but dully, or retain the ideas that come into their minds but ill, who cannot readily excite or compound them, will have little matter to think on. Those who cannot distinguish, compare, and abstract, would hardly be able to understand and make use of language, or judge or reason to any tolerable degree; but only a little and imperfectly about things present, and very familiar to their senses. And indeed any of the forementioned faculties, if wanting, or out of order, produce suitable defects in men's understandings and knowledge.

§13. In fine, the defect in naturals seems to proceed from want of quickness, activity, and motion in the intellectual faculties, whereby they are deprived of reason; whereas madmen, on the other side, seem to suffer by the other extreme. For they do not appear to me to have lost the faculty of reasoning, but having joined together some ideas very wrongly, they mistake them for truths; and they err as men do that argue right from wrong principles. For, by the violence of their imaginations, having taken their fancies for realities, they make right deductions from them. Thus you shall find a distracted man fancying himself a king, with a right inference require suitable attendance, respect, and obedience: others who have thought themselves made of glass, have used the caution necessary to preserve such brittle bodies. Hence it comes to pass that a man who is very sober, and of a right understanding in all other things, may in one particular be as frantic as any in Bedlam; if either by any sudden very strong impression, or long fixing his fancy upon one sort of thoughts, incoherent ideas have been cemented together so powerfully, as to remain united. But there are degrees of madness, as of folly; the disorderly jumbling ideas together is in some more, and some less. In short, herein seems to lie the difference between idiots and madmen: that madmen put wrong ideas together, and so make wrong propositions, but argue and reason right

from them; but idiots make very few or no propositions, and reason scarce at all.

§14. Method. These, I think, are the first faculties and operations of the mind, which it makes use of in understanding; and though they are exercised about all its ideas in general, yet the instances I have hitherto given have been chiefly in simple ideas. And I have subjoined the explication of these faculties of the mind to that of simple ideas, before I come to what I have to say concerning complex ones, for these following reasons: First, Because several of these faculties being exercised at first principally about simple ideas, we might, by following nature in its ordinary method, trace and discover them, in their rise, progress, and gradual improvements.

Secondly, Because observing the faculties of the mind, how they operate about simple ideas, which are usually, in most men's minds, much more clear, precise, and distinct than complex ones, we may the better examine and learn how the mind extracts, denominates, compares, and exercises, in its other operations about those which are complex, wherein we are much more liable to mistake.

Thirdly, Because these very operations of the mind about ideas received from sensations, are themselves, when reflected on, another set of ideas, derived from that other source of our knowledge, which I call reflection; and therefore fit to be considered in this place after the simple ideas of sensation. Of compounding, comparing, abstracting, etc., I have but just spoken, having occasion to treat of them more at large in other places.

§15. These are the beginning of human knowledge. And thus I have given a short, and, I think, true history of the first beginnings of human knowledge; whence the mind has its first objects; and by what steps it makes its progress to the laying in and storing up those ideas, out of which is to be framed all the knowledge 'tis capable of: wherein I must appeal to experience and observation whether I am in the right: the best way to come to truth being to examine things as really they are, and not to conclude they are, as we fancy of ourselves, or have been taught by others to imagine.

§16. Appeal to experience. To deal truly, this is the only way, that I can discover, whereby the ideas of things are brought into the

understanding. If other men have either innate ideas or infused principles, they have reason to enjoy them; and if they are sure of it, 'tis impossible for others to deny them the privilege that they have above their neighbours. I can speak but of what I find in myself, and is agreeable to those notions, which, if we will examine the whole course of men in their several ages, countries, and educations, seem to depend on those foundations which I have laid, and to correspond with this method in all the parts and degrees thereof.

§17. Dark room. I pretend not to teach, but to inquire; and therefore cannot but confess here again, that external and internal sensation are the only passages I can find, of knowledge to, the understanding. These alone, as far as I can discover, are the windows by which light is let into this dark room. For, methinks, the understanding is not much unlike a closet wholly shut from light, with only some little openings left, to let in external visible resemblances, or ideas of things without: would the pictures coming into such a dark room but stay there, and lie so orderly as to be found upon occasion, it would very much resemble the understanding of a man, in reference to all objects of sight, and the ideas of them.

These are my guesses concerning the means whereby the understanding comes to have and retain simple ideas, and the modes of them, with some other operations about them. I proceed now to examine some of these simple ideas and their modes a little more particularly.

Chapter XII Of Complex Ideas

§1. Made by the mind out of simple ones. We have hitherto considered those ideas, in the reception whereof the mind is only passive, which are those simple ones received from sensation and reflection before mentioned, whereof the mind cannot make one to itself, nor have any idea which does not wholly consist of them.

But as the mind is wholly passive in the reception of all its simple ideas, so it exerts several acts of its own, whereby out of its simple ideas, as the materials and foundations of the rest, the others are framed. The acts of the mind, wherein it exerts its power over its simple ideas, are chiefly these three: 1. Combining several simple ideas into one compound one; and thus all complex ideas are made.

2. The second is bringing two ideas, whether simple or complex, together, and setting them by one another, so as to take a view of them at once, without uniting them into one; by which way it gets all its ideas of relations. 3. The third is separating them from all other ideas that accompany them in their real existence: this is called abstraction: and thus all its general ideas are made. This shows man's power, and its ways of operation, to be much the same in the material and intellectual world. For the materials in both being such as he has no power over, either to make or destroy, all that man can do is either to unite them together, or to set them by one another, or wholly separate them. I shall here begin with the first of these in the consideration of complex ideas, and come to the other two in their due places. As simple ideas are observed to exist in several combinations united together, so the mind has a power to consider several of them united together as one idea; and that not only as they are united in external objects, but as itself has joined them together.

Ideas thus made up of several simple ones put together, I call complex; such as are beauty, gratitude, a man, an army, the universe; which, though complicated of various simple ideas, or complex ideas made up of simple ones, yet are, when the mind pleases, considered each by itself, as one entire thing, and signified by one name.

§2. Made voluntarily. In this faculty of repeating and joining together its ideas, the mind has great power in varying and multiplying the objects of its thoughts, infinitely beyond what sensation or reflection furnished it with: but all this still confined to those simple ideas which it received from those two sources, and which are the ultimate materials of all its compositions. For simple ideas are all from things themselves, and of these the mind can have no more, nor other than what are suggested to it. It can have no other ideas of sensible qualities than what come from without by the senses; nor any ideas of other kind of operations of a thinking substance, than what it finds in itself. But when it has once got these simple ideas, 'tis not confined barely to observation, and what offers itself from without; it can, by its own power, put together those ideas it has, and make new complex ones, which it never received so united.

§3. Are either modes, substances, or relations. Complex ideas, however compounded and decomposed, though their number

be infinite, and the variety endless, wherewith they fill and entertain the thoughts of men; yet I think they may be all reduced under these three heads:

1. Modes.

2. Substances.

3. Relations.

§4. modes. First, modes I call such complex ideas which, however compounded, contain not in them the supposition of subsisting by themselves, but are considered as dependences on, or affections of substances; such as are the ideas signified by the words triangle, gratitude, murder, etc. And if in this I use the word mode in somewhat a different sense from its ordinary signification, I beg pardon; it being unavoidable in discourses, differing from the ordinary received notions, either to make new words, or to use old words in some-what a new signification; the later whereof, in our present case, is perhaps the more tolerable of the two.

§5. Simple and mixed modes. Of these modes, there are two sorts which deserve distinct consideration: First, there are some which are only variations, or different combinations of the same simple idea, without the mixture of any other; as a dozen, or score; which are nothing but the ideas of so many distinct units added together, and these I call simple modes as being contained within the bounds of one simple idea. Secondly, there are others compounded of simple ideas of several kinds, put together to make one complex one; v.g. beauty, consisting of a certain composition of colour and figure, causing delight to the beholder; theft, which being the concealed change of the possession of anything, without the consent of the proprietor, contains, as is visible, a combination of several ideas of several kinds: and these I call mixed modes.

§6. Substances single or collective. Secondly, the ideas of substances are such combinations of simple ideas, as are taken to represent distinct particular things subsisting by themselves; in which the supposed or confused idea of substance, such as 'tis, is always the first and chief. Thus if to substance be joined the simple idea of a certain dull whitish colour, with certain degrees of weight, hardness, ductility, and fusibility, we have the idea of lead; and a

combination of the ideas of a certain sort of figure, with the powers of motion, thought and reasoning, joined to substance, the ordinary idea of a man. Now, of substances also, there are two sorts of ideas: one of single substances, as they exist separately, as of a man or a sheep; the other of several of those put together as an army of men, or flock of sheep which collective ideas of several substances thus put together, are as much each of them one single idea as that of a man or an unit.

§7. Relation. Thirdly, the last sort of complex ideas is that we call relation, which consists in the consideration and comparing one idea with another: of these several kinds we shall treat in their order.

§8. The abstrusest ideas from the two sources. If we trace the progress of our minds, and with attention observe how it repeats, adds together, and unites its simple ideas received from sensation or reflection, it will lead us further than at first perhaps we should have imagined. And, I believe, we shall find, if we warily observe the originals of our notions, that even the most abstruse ideas, how remote soever they may seem from sense, or from any operations of our own minds, are yet only such as the understanding frames to itself, by repeating and joining together ideas that it had either from objects of sense, or from its own operations about them: so that those even large and abstract ideas are derived from sensation or reflection, being no other than what the mind, by the ordinary use of its own faculties, employed about ideas received from objects of sense, or from the operations it observes in itself about them, may, and does, attain unto. This I shall endeavour to show in the ideas we have of space, time, and infinity, and some few others that seem the most remote, from those originals.

Chapter XIII Of Simple Modes; and first, of the Simple Modes of Space

§1. Simple modes. Though in the foregoing part, I have often mentioned simple ideas, which are truly the materials of all our knowledge; yet having treated of them there, rather in the way that they come into the mind, than as distinguished from others more compounded, it will not be perhaps amiss to take a view of some of them again under this consideration, and examine those different modifications of the same idea; which the mind either finds in things existing, or is able to make within itself, without the help of any

extrinsical object, or any foreign suggestion.

Those modifications of any one simple idea, (which, as has been said, I call simple modes) are as perfectly different and distinct ideas in the mind, as those of the greatest distance or contrariety. For the idea of two is as distinct from that of one, as blueness from heat, or either of them from any number: and yet 'tis made up only of that simple idea of an unit repeated; and repetitions of this kind joined together, make those distinct simple modes, of a dozen, a gross, a million.

§2. Idea of Space. I shall begin with the simple idea of space. I have showed above, c.4. that we get the idea of space, both by our sight, and touch; which, I think, is so evident, that it would be as needless to go to prove, that men perceive, by their sight, a distance between bodies of different colours, or between the parts of the same body; as that they see colours themselves: nor is it less obvious, that they can do so in the dark by feeling and touch.

§3. Space and extension. This space considered barely in length between any two beings, without considering anything else between them, is called distance: if considered in length, breadth, and thickness, I think it may be called capacity. the term extension, is usually applied to it in what manner soever considered.

§4. Immensity. Each different distance, is a different modification of space, and each idea of any different distance, or space, is a simple mode of this idea. Men, for the use and by the custom of measuring, settle in their minds the ideas of certain stated lengths, such as are an inch, foot, yard, fathom, mile, diameter of the earth, etc. which are so many distinct ideas made up only of space. When any such stated lengths or measures of space are made familiar to men's thoughts, they can, in their minds, repeat them as often as they will, without mixing or joining to them the idea of body, or anything else; and frame to themselves the ideas of long, square, or cubic feet, yards or fathoms, here amongst the bodies of the universe, or else beyond the utmost bounds of all bodies; and by adding these still one to another, enlarge their ideas of space as much as they please. The power of repeating or doubling any idea we have of any distance, and adding it to the former as often as we will, without being ever able to come to any stop or stint, let us enlarge it as much as we will, is that, which gives us the idea of immensity.

§5. Figure. There is another modification of this idea, which is nothing but the relation which the parts of the termination of extension, or circumscribed space, have amongst themselves.

This the touch discovers in sensible bodies, whose extremities come within our reach; and the eye takes both from bodies and colours, whose boundaries are within its view: where, observing how the extremities terminate either in straight lines which meet at discernible angles, or in crooked lines wherein no angles can be perceived; by considering these as they relate to one another, in all parts of the extremities of any body or space, it has that idea we call figure, which affords to the mind infinite variety. For, besides the vast number of different figures that do really exist in the coherent masses of matter, the stock that the mind has in its power, by varying the idea of space, and thereby making still new compositions, by repeating its own ideas, and joining them as it pleases, is perfectly inexhaustible. And so it can multiply figures in infinitum.

§6. For the mind having a power to repeat the idea of any length directly stretched out, and join it to another in the same direction, which is to double the length of that straight line; or else join another with what inclination it thinks fit, and so make what sort of angle it pleases: and being able also to shorten any line it imagines, by taking from it one half, one fourth, or what part it pleases, without being able to come to an end of any such divisions, it can make an angle of any bigness. So also the lines that are its sides, of what length it pleases, which joining again to other lines of different lengths, and at different angles, till it has wholly enclosed any space, 'tis evident that it can multiply figures, both in their shape, and capacity, in infinitum; all which are but so many different simple modes of space.

The same that it can do with straight lines, it can also do with crooked, or crooked and straight together; and the same it can do in lines, it can also in superficies; by which we may be led into farther thoughts of the endless variety of figures that the mind has a power to make, and thereby to multiply the simple modes of space.

§7. Place. Another idea coming under this head, and belonging to this tribe, is that we call place. As in simple space, we consider the relation of distance between any two bodies, or points; so in our idea of place, we consider the relation of distance betwixt anything, and any two or more points, which are considered as keeping the same

distance one with another, and so considered as at rest. For when we find anything at the same distance now, which it was yesterday from any two or more points, which have not since changed their distance one with another, and with which we then compared it, we say it hath kept the same place: but if it hath sensibly altered its distance with either of those points, we say it hath changed its place: though vulgarly speaking, in the common notion of place, we do not always exactly observe the distance from precise points, but from larger portions of sensible objects, to which we consider the thing placed to bear relation, and its distance from which we have some reason to observe.

§8. Thus a company of chess-men, standing on the same squares of the chess-board where we left them, we say they are all in the same place, or unmoved, though perhaps, the chess-board hath been in the meantime carried out of one room into another, because we compared them only to the parts of the chess-board, which keep the same distance one with another. The chess-board, we also say, is in the same place it was, if it remain in the same part of the cabin, though perhaps the ship which 'tis in, sails all the while: and the ship is said to be in the same place, supposing it kept the same distance with the parts of the neighbouring land; though perhaps the Earth hath turned round, and so both chessmen, and board, and ship, have every one changed place, in respect of remoter bodies, which have kept the same distance one with another. But yet the distance from certain parts of the board, being that which determines the place of the chess-men; and the distance from the fixed parts of the cabin (with which we made the comparison) being that which determined the place of the chess-board; and the fixed parts of the Earth, that by which we determined the place of the ship, these things may be said properly to be in the same place, in those respects: though their distance from some other things, which in this matter we did not consider, being varied, they have undoubtedly changed place in that respect; and we ourselves shall think so, when we have occasion to compare them with those other.

§9. But this modification of distance we call place, being made by men, for their common use, that by it they might be able to design the particular position of things, where they had occasion for such designation men consider and determine of this place, by reference to those adjacent things, which best served to their present purpose,

without considering other things, which, to another purpose, would better determine the place of the same thing. Thus in the chess-board, the use of the designation of the place of each chessman, being determined only within that chequered piece of wood, it would cross that purpose, to measure it by anything else: but when these very chess-men are put up in a bag, if any one should ask where the black king is, it would be proper to determine the place by the part of the room it was in, and not by the chess-board; there being another use of designing the place 'tis now in, than when in play it was on the chess-board, and so must be determined by other bodies. So if any one should ask, in what place are the verses which report the story of Nisus and Euryalus, it would be very improper to determine this place, by saying, they were in such a part of the earth, or in Bodley's Library: but the right designation of the place, would be by the parts of Virgil's works; and the proper answer would be, that these verses were about the middle of the ninth book of his 'neids; and that they have been always constantly in the same place ever since Virgil was printed: which is true, though the book itself hath moved a thousand times, the use of the idea of place here being, to know in what part of the book that story is, that so, upon occasion, we may know where to find it, and have recourse to it for use.

§10. Place of the universe. That our idea of place is nothing else, but such a relative position of anything, as I have before mentioned, I think is plain, and will be easily admitted, when we consider that we can have no idea of the place of the universe, though we can of all the parts of it; because beyond that, we have not the idea of any fixed, distinct, particular beings, in reference to which we can imagine it to have any relation of distance; but all beyond 'tis one uniform space or expansion, wherein the mind finds no variety, no marks. For to say, that the world is somewhere, means no more, than that it does exist; this, though a phrase, borrowed from place, signifying only its existence, not location; and when one can find out, and frame in his mind clearly and distinctly the place of the universe, he will be able to tell us, whether it moves or stands still in the undistinguishable inane of infinite space; though it be true, that the word place has sometimes a more confused sense, and stands for that space which anybody takes up; and so the universe is in a place. The idea, therefore of place, we have by the same means that we get the idea of space, (whereof this is but a particular limited, consideration,) viz, by our sight and touch; by either of which, we receive into our

minds the ideas of extension or distance.

§11. Extension and body not the same. There are some that would persuade us, that body and extension are the same thing, who either change the signification of words, which I would not suspect them of, they having so severely condemned the philosophy of others, because it hath been too much placed in the uncertain meaning, or deceitful obscurity of doubtful or insignificant terms. If therefore they mean by body and extension the same that other people do, viz. by body something that is solid, and extended, whose parts are separable and movable different ways; and by extension, only the space that lies between the extremities of those solid coherent parts, and which is possessed by them, they confound very different ideas one with another 'For I appeal to every man's own thoughts, whether the idea of space be not as distinct from that of solidity, as 'tis from the idea of scarlet colour' 'Tis true, solidity cannot exist without extension, neither can scarlet colour exist without extension; but this hinders not, but that they are distinct ideas. Many ideas require others as necessary to their existence or conception, which yet are very distinct ideas. Motion can neither be, nor be conceived without space; and yet motion is not space, nor space motion: space can exist without it, and they are very distinct ideas; and so, I think, are those of space and solidity. Solidity is so inseparable an idea from body, that upon that depends its filling of space, its contact, impulse, and communication of motion upon impulse. And if it be a reason to prove, that spir'tis different from body, because thinking includes not the idea of extension in it; the same reason will be as valid, I suppose, to prove, that space is not body, because it includes not the idea of solidity in it; space and solidity being as distinct ideas as thinking and extension, and as wholly separable in the mind one from another. Body then and extension, 'tis evident, are two distinct ideas. For,

§12. First, extension includes no solidity, nor resistance to the motion of body, as body does.

§13. Secondly, the parts of pure space are inseparable one from the other; so that the continuity cannot be separated, neither really, nor mentally. For I demand of anyone, to remove any part of it from another, with which 'tis continued, even so much as in thought.

To divide and separate actually, is, as I think, by removing the parts one from another, to make two superficies, where before there

was a continuity: and to divide mentally, is to make in the mind two superficies, where before there was a continuity, and consider them as removed one from the other; which can only be done in things considered by the mind as capable of being separated; and by separation, of acquiring new distinct superficies, which they then have not, but are capable of: but neither of these ways of separation, whether real or mental, is, as I think, compatible to pure space.

'Tis true, a man may consider so much of such a space, as is answerable or commensurate to a foot, without considering the rest, which is indeed a partial consideration, but not so much as mental separation, or division; since a man can no more mentally divide, without considering two superficies, separate one from the other, than he can actually divide, without making two superficies disjoined one from the other: but a partial consideration is not separating. A man may consider light in the sun, without its heat, or mobility in body without its extension, without thinking of their separation. One is only a partial consideration, terminating in one alone; and the other is a consideration of both, as existing separately.

§14. Thirdly, the parts of pure space, are immovable, which follows from their inseparability; motion being nothing but change of distance between any two things: but this cannot be between parts that are inseparable: which therefore must needs be at perpetual rest one amongst another.

Thus the determined idea of simple space distinguishes it plainly and sufficiently from body; since its parts are inseparable, immovable, and without resistance to the motion of body.

§15. The definition of extension explains it not. If anyone ask me, what this space, I speak of, is, I will tell him, when he tells me what his extension is. For to say, as is usually done, that extension is to have partes extra partes, is to say only, that extension is extension.

For what am I the better informed in the nature of extension, when I am told that extension is to have parts that are extended, exterior to parts that are extended, i.e. extension consists of extended parts? As if one asking, what a fibre was, I should answer him, that it was a thing made up of several fibres: Would he thereby be enabled to understand what a fibre was, better than he did before? Or

rather, would he not have reason to think, that my design was to make sport with him, rather than seriously to instruct him'

§16. Division of beings into bodies and spirits proves not space and body the same. Those who contend that space and body are the same, bring this dilemma. either this space is something, or nothing; if nothing be between two bodies, they must necessarily touch; if it be allowed to be something, they ask, Whether it be body or spirit 'To which I answer, by another question, Who told them, that there was, or could be nothing but solid beings, which could not think; and thinking beings that were not extended' which is all they mean by the terms body and spirit.

§17. Substance which we know not, no proof against space without body. If it be demanded, (as usually 'tis) whether this space, void of body, be substance or accident, I shall readily answer I know not: nor shall be ashamed to own my ignorance, till they that ask, show me a clear distinct idea of substance.

§18. I endeavour as much as I can, to deliver myself from those fallacies which we are apt to put upon ourselves, by taking words for things. It helps not our ignorance to feign a knowledge, where we have none, by making a noise with sounds, without clear and distinct significations. Names made at pleasure, neither alter the nature of things, nor make us understand them, but as they are signs of, and stand for determined ideas. And I desire those who lay so much stress on the sound of these two syllables, substance, to consider, whether applying it, as they do, to the infinite incomprehensible God, to finite spirits, and to body, it be in the same sense; and whether it stands for the same idea, when each of those three so different beings are called substances' If so, whether it will thence follow, that God, spirits, and body, agreeing in the same common nature of substance, differ not any otherwise, than in a bare different modification of that substance; as a tree and a pebble, being in the same sense body, and agreeing in the common nature of body, differ only in a bare modification of that common matter; which will be a very harsh doctrine. If they say, that they apply it to God, finite spirit, and matter, in three different significations, and that it stands for one idea, when God is said to be a substance; for another when the soul is called substance; and for a third, when body is called so. if the name substance, stands for three several distinct ideas, they would do well to make known those

distinct ideas, or at least to give three distinct names to them, to prevent in so important a notion, the confusion and errors that will naturally follow from the promiscuous use of so doubtful a term; which is so far from being suspected to have three distinct, that in ordinary use it has scarce one clear distinct signification: And if they can thus make three distinct ideas of substance, what hinders why another may not make a fourth‘

§19. Substance and accidents of little use in philosophy. They who first ran into the notion of accidents, as a sort of real beings; that needed something to inhere in, were forced to find out the word substance, to support them. Had the poor Indian philosopher (who imagined that the Earth also wanted something to bear it up) but thought of this word substance, he needed not to have been at the trouble to find an elephant to support it, and a tortoise to support his elephant: the word substance would have done it effectually. And he that inquired might have taken it for as good an answer from an Indian philosopher, that substance, without knowing what 'tis, is that which supports the Earth, as we take it for a sufficient answer and good doctrine, from our European philosophers, that substance, without knowing what 'tis, is that which supports accidents. So that of substance, we have no idea of what 'tis, but only a confused obscure one of what it does.

§20. Whatever a learned man may do here, an intelligent American, who inquired into the nature of things, would scarce take it for a satisfactory account, if desiring to learn our architecture, he should be told, that a pillar is a thing supported by a basis, and a basis something that supported a pillar. Would he not think himself mocked, instead of taught, with such an account as this‘ And a stranger to them would be very liberally instructed in the nature of books, and the things they contained, if he should be told, that all learned books consisted of paper and letters, and that letters were things inhering in paper, and paper a thing that held forth letters; a notable way of having clear ideas of letters and paper‘ But were the Latin words *inhaerentia* and *substantio*, put into the plain English ones that answer them, and were called sticking on, and underpropping, they would better discover to us the very great clearness there is in the doctrine of substance and accidents, and show of what use they are in deciding of questions in philosophy.

§21. A vacuum beyond the utmost bounds of body. But to return to our idea of space. If body be not supposed infinite, which, I think, no one will affirm, I would ask, whether, if God placed a man at the extremity of corporeal beings, he could not stretch his hand beyond his body? If he could, then he would put his arm, where there was before space without body; and if there he spread his fingers, there would still be space between them without body: If he could not stretch out his hand, it must be because of some external hindrance; (for we suppose him alive, with such a power of moving the parts of his body, that he hath now, which is not in itself impossible, if God so pleased to have it; or at least 'tis not impossible for God so to move him:) and then I ask, whether that which hinders his hand from moving outwards, be substance or accident, something or nothing? And when they have resolved that, they will be able to resolve themselves, what that is, which is, or may be between two bodies at a distance, that is not body, and has no solidity. In the mean time, the argument is at least as good, that where nothing hinders, (as beyond the utmost bounds of all bodies), a body put into motion may move on, as where there is nothing between, there two bodies must necessarily touch: For pure space between, is sufficient to take away the necessity of mutual contact; but bare space in the way, is not sufficient to stop motion. The truth is, these men must either own, that they think body infinite, though they are loth to speak it out, or else affirm, that space is not body. For I would fain meet with that thinking man, that can in his thoughts, set any bounds to space, more than he can to duration; or by thinking; hope to arrive at the end of either: And therefore, if his idea of eternity be infinite, so is his idea of immensity; they are both finite or infinite alike.

§22. The power of annihilation proves a vacuum. Further, those who assert the impossibility of space existing without matter, must not only make body infinite, but must also deny a power in God to annihilate any part of matter. No one, I suppose, will deny that God can put an end to all motion that is in matter, and fix all the bodies of the universe in a perfect quiet and rest, and continue them so long as he pleases. Whoever then will allow, that God can, during such a general rest, annihilate either this book or the body of him that reads it, must necessarily admit the possibility of a vacuum: For, 'tis evident, that the space, that was filled by the parts of the annihilated body, will still remain, and be a space without body. For the circumambient bodies being in perfect rest, are a wall of adamant, and in that state

make it a perfect impossibility for any other body to get into that space. And indeed the necessary motion of one particle of matter, into the place from whence another particle of matter is removed, is but a consequence from the supposition of plenitude; which will therefore need some better proof, than a supposed matter of fact, which experiment can never make out, our own clear and distinct ideas plainly satisfying us, that there is no necessary connexion between space and solidity, since we can conceive the one without the other. And those who dispute for or against a vacuum, do thereby confess, they have distinct ideas of vacuum and plenum, i.e. that they have an idea of extension void of solidity, though they deny its existence; or else they dispute about nothing at all.

For they who so much alter the signification of words, as to call extension, body, and consequently make the whole essence of body to be nothing but pure extension without solidity, must talk absurdly whenever they speak of vacuum, since 'tis impossible for extension to be without extension. For vacuum, whether we affirm or deny its existence, signifies space without body; whose very existence no one can deny to be possible, who will not make matter infinite, and take from God a power to annihilate any particle of it.

§23. Motion proves a vacuum. But not to go so far as beyond the utmost bounds of body in the universe, nor appeal to God's omnipotency to find a vacuum, the motion of bodies that are in our view and neighbourhood, seems to me plainly to evince it. For I desire any one so to divide a solid body, of any dimension he pleases, as to make it possible for the solid parts to move up and down freely every way within the bounds of that superficies, if there be not left in it a void space, as big as the least part into which he has divided the said solid body. And if where the least particle of the body divided, is as big as a mustard-seed, a void space equal to the bulk of a mustard-seed, be requisite to make room for the free motion of the parts of the divided body within the bounds of its superficies, where the particles of matter are 100,000,000 less than a mustard-seed, there must also be a space void of solid matter as big as 100,000,000 part of a mustard-seed; for if it hold in one, it will hold in the other, and so on in infinitum. And let this void space be as little as it will, it destroys the hypothesis of plenitude. For if there can be a space void of body, equal to the smallest separate particle of matter now existing in nature, 'tis still space without body; and makes as great a difference between

space and body, as if it were mega chasma, a distance as wide as any in nature. And therefore, if we suppose not the void space necessary to motion, equal to the least parcel of the divided solid matter, but to $1/10$ or $1/1000$ of it, the same consequence will always follow of space, without matter.

§ 24. The ideas of space and body distinct. But the question being here, Whether the idea of space or extension be the same with the idea of body, 'tis not necessary to prove the real existence of a vacuum, but the idea of it; which 'tis plain men have, when they inquire and dispute, whether there be a vacuum or no. For if they had not the idea of space without body, they could not make a question about its existence: and if their idea of body did not include in it something more than the bare idea of space, they could have no doubt about the plenitude of the world; and it would be as absurd to demand, whether there were space without body, as whether there were space without space, or body without body, since these were but different names of the same idea.

§ 25. Extension being inseparable from body, proves it not the same. 'Tis true, the idea of extension joins itself so inseparably with all visible, and most tangible qualities, that it suffers us to see no one, or feel very few external objects, without taking in impressions of extension too. This readiness of extension to make itself be taken notice of so constantly with other ideas, has been the occasion, I guess, that some have made the whole essence of body to consist in extension; which is not much to be wondered at, since some have had their minds, by their eyes and touch, (the busiest of all our senses,) so filled with the idea of extension, and, as it were wholly possessed with it, that they allowed no existence to anything that had not extension. I shall not now argue with those men, who take the measure and possibility of all being, only from their narrow and gross imaginations: but having here to do only with those who conclude the essence of body to be extension, because, they say, they cannot imagine any sensible quality of any body without extension, I shall desire them to consider, that, had they reflected on their ideas of tastes and smells, as much as on those of sight and touch; nay, had they examined their ideas of hunger and thirst, and several other pains, they would have found that they included in them no idea of extension at all, which is but an affection of body, as well as the rest, discoverable by our senses, which are scarce acute enough to look into the pure essences of

things.

§26. If those ideas which are constantly joined to all others, must therefore be concluded to be the essence of those things which have constantly those ideas joined to them, and are inseparable from them; then unity is without doubt the essence of everything. For there is not any object of sensation or reflection which does not carry with it the idea of one: but the weakness of this kind of argument, we have already shown sufficiently.

§27. Ideas of space and solidity distinct. To conclude, whatever men shall think concerning the existence of a vacuum, this is plain to me, that we have as clear an idea of space distinct from solidity, as we have of solidity distinct from motion, or motion from space. We have not any two more distinct ideas; and we can as easily conceive space without solidity, as we can conceive body or space without motion, though it be never so certain that neither body nor motion can exist without space. But whether any one will take space to be only a relation resulting from the existence of other beings at a distance or whether they will think the words of the most knowing King Solomon, 'The heaven, and the heaven of heavens, cannot contain thee'; or those more emphatical ones of the inspired philosopher St Paul, 'In him we live, move, and have our being,' are to be understood in a literal sense, I leave every one to consider, only our idea of space is, I think, such as I have mentioned, and distinct from that of body. For, whether we consider in matter itself, the distance of its coherent solid parts, and call it, in respect of those solid parts, extension; or whether, considering it as lying between the extremities of any body in its several dimensions, we call it length, breadth, and thickness; or else, considering it as lying between any two bodies, or positive beings, without any consideration, whether there be any matter or not between, we call it distance. However named or considered, 'tis always the same uniform simple idea of space, taken from objects, about which our senses have been conversant, whereof having settled ideas in our minds, we can revive, repeat, and add them one to another as often as we will, and consider the space or distance so imagined, either as filled with solid parts, so that another body cannot come there, without displacing and thrusting out the body that was there before; or else as void of solidity, so that a body of equal dimensions to that empty or pure space, may be placed in it, without the removing or expulsion of anything that was there. But to avoid

confusion in discourses concerning this matter, it were possibly to be wished that the name extension were applied only to matter, or the distance of the extremities of particular bodies and the term expansion to space in general, with or without solid matter possessing it, so as to say space is expanded, and body extended. But in this, every one has his liberty: I propose it only for the more clear and distinct way of speaking.

§28. Men differ little in clear simple ideas. The knowing precisely what our words stand for, would, I imagine, in this, as well as a great many other cases, quickly end the dispute. For I am apt to think, that men, when they come to examine them, find their simple ideas all generally to agree, though in discourse with one another they perhaps confound one another with different names. I imagine, that men who abstract their thoughts, and do well examine the ideas of their own minds, cannot much differ in thinking; however, they may perplex themselves with words, according to the way of speaking to the several schools or sects they have been bred up in: though amongst unthinking men, who examine not scrupulously and carefully their own ideas, and strip them not from the marks men use for them, but confound them with words, there must be endless dispute, wrangling, and jargon; especially if they be learned bookish men, devoted to some sect, and accustomed to the language of it, and have learned to talk after others. But if it should happen, that any two thinking men should really have different ideas, I do not see how they could discourse or argue with another. Here I must not be mistaken, to think that every floating imagination in men's brains, is presently of that sort of ideas I speak of. 'Tis not easy for the mind to put off those confused notions and prejudices it has imbibed from custom, inadvertency, and common conversation: It requires pains and assiduity to examine its ideas, till it resolves them into those clear and distinct simple ones, out of which they are compounded; and to see which, amongst its simple ones, have or have not a necessary connexion and dependence one upon another. Till a man doth this in the primary and original notions of things, he builds upon floating and uncertain principles, and will often find himself at a loss.

Chapter XIV Of Duration, and its Simple Modes

§1. Duration is fleeting extension. There is another sort of distance, or length, the idea whereof we get not from the permanent

parts of space, but from the fleeting and perpetually perishing parts of succession. This we call duration; the simple modes whereof are any different lengths of it, whereof we have distinct ideas, as hours, days, years, etc. time, and eternity.

§2. Its idea from reflection on the train of our ideas. The answer of a great man, to one who asked what time was, 'Si non rogas intelligo', (which amounts to this; The more I set myself to think of it, the less I understand it,) might perhaps persuade one, that time, which reveals all other things, is itself not to be discovered. Duration, time, and eternity, are, not without reason, thought to have something very abstruse in their nature. But however remote these may seem from our comprehension, yet if we trace them right to their originals, I doubt not but one of those sources of all our knowledge, viz. sensation and reflection, will be able to furnish us with these ideas, as clear and distinct as many others which are thought much less obscure; and we shall find, that the idea of eternity itself is derived from the same common original with the rest of our ideas.

§3. To understand time and eternity aright, we ought with attention to consider what idea 'tis we have of duration, and how we came by it. 'Tis evident to anyone, who will but observe what passes in his own mind, that there is a train of ideas, which constantly succeed one another in his understanding, as long as he is awake. Reflection on these appearances of several ideas, one after another, in our minds, is that which furnishes us with the idea of succession: and the distance between any parts of that succession, or between the appearance of any two ideas in our minds, is that we call duration. For whilst we are thinking, or whilst we receive successively several ideas in our minds, we know that we do exist; and so we call the existence, or the continuation of the existence of ourselves, or anything else, commensurate to the succession of any ideas in our minds, the duration of ourselves, or any such other thing co-existent with our thinking.

§4. That we have our notion of succession and duration from this original, viz. from reflection on the train of ideas, which we find to appear one after another in our own minds, seems plain to me, in that we have no perception of duration but by considering the train of ideas, that take their turns in our understandings. When that succession of ideas ceases, our perception of duration ceases with it;

which every one clearly experiments in himself, whilst he sleeps soundly, whether an hour, or a day, a month, or a year; of which duration of things, while he sleeps, or thinks not, he has no perception at all, but 'tis quite lost to him; and the moment wherein he leaves off to think, till the moment he begins to think again, seems to him to have no distance. And so I doubt not but it would be to a waking man, if it were possible for him to keep only one idea in his mind, without variation, and the succession of others: and we see, that one who fixes his thoughts very intently on one thing, so as to take but little notice of the succession of ideas that pass in his mind, whilst he is taken up with that earnest contemplation, lets slip out of his account a good part of that duration, and thinks that time shorter than 'tis. But if sleep commonly unites the distant parts of duration, 'tis because during that time we have no succession of ideas in our minds. For if a man, during his sleep, dreams, and variety of ideas make themselves perceptible in his mind one after another, he hath then, during such dreaming, a sense of duration, and of the length of it. By which 'tis to me very clear, that men derive their ideas of duration, from their reflections on the train of the ideas they observe to succeed one another in their own understandings; without which observation they can have no notion of duration, whatever may happen in the world.

§5. The idea of duration applicable to things whilst we sleep. Indeed a man having from reflecting on the succession and number of his own thoughts, got the notion or idea of duration, he can apply that notion to things, which exist while he does not think; as he that has got the idea of extension from bodies by his sight or touch, can apply it to distances, where no body is seen or felt. And therefore, though a man has no perception of the length of duration, which passed whilst he slept or thought not; yet, having observed the revolution of days and nights, and found the length of their duration to be in appearance regular and constant, he can, upon the supposition that that revolution has proceeded after the same manner, whilst he was asleep or thought not, as it used to do at other times; he can, I say, imagine and make allowance for the length of duration, whilst he slept. But if Adam and Eve (when they were alone in the world) instead of their ordinary night's sleep, had passed the whole 24 hours in one continued sleep, the duration of that 24 hours had been irrecoverably lost to them, and been for ever left out of their account of time.

§6. The idea of succession not from motion. Thus by reflecting on

the appearing of various ideas one after another in our understandings, we get the notion of succession; which, if any one should think, we did rather get from our observation of motion by our senses, he will, perhaps, be of my mind, when he considers, that even motion produces in his mind an idea of succession, no otherwise than as it produces there a continued train of distinguishable ideas. For a man looking upon a body really moving, perceives yet no motion at all, unless that motion produces a constant train of successive ideas, v.g. a man be calmed at sea, out of sight of land, in a fair day, may look on the sun, or sea, or ship, a whole hour together, and perceive no motion at all in either; though it be certain that two, and perhaps all of them, have moved, during that time, a great way: but as soon as he perceives either of them to have changed distance with some other body, as soon as this motion produces any new idea in him, then he perceives, that there has been motion. But wherever a man is, with all things at rest about him, without perceiving any motion at all, if during this hour of quiet he has been thinking, he will perceive the various ideas of his own thoughts in his own mind, appearing one after another, and thereby observe and find succession, where he could observe no motion.

§7. And this, I think, is the reason why motions very slow, though they are constant, are not perceived by us; because in their remove from one sensible part towards another, their change of distance is so slow, that it causes no new ideas in us, but a good while one after another: and so not causing a constant train of new ideas, to follow one another immediately in our minds, we have no perception of motion; which consisting in a constant succession, we cannot perceive that succession, without a constant succession of varying ideas arising from it.

§8. On the contrary, things that move so swift, as not to affect the senses distinctly with several distinguishable distances of their motion, and so cause not any train of ideas in the mind, are not also perceived to move. For anything that moves round about in a circle in less times than our ideas are wont to succeed one another in our minds, is not perceived to move; but seems to be a perfect, entire circle of that matter or colour, and not a part of a circle in motion.

§9. The train of ideas has a certain degree of quickness. Hence I leave it to others to judge, whether it be not probable, that our ideas

do, whilst we are awake, succeed one another in our minds at certain distances not much unlike the images in the inside of a lantern, turned round by the heat of a candle. This appearance of theirs in train, though perhaps it may be sometimes faster and sometimes slower; yet, I guess, varies not very much in a waking man: there seem to be certain bounds to the quickness and slowness of the succession of those ideas one to another in our minds, beyond which they can neither delay nor hasten.

§10. The reason I have for this odd conjecture is, from observing that in the impressions made upon any of our senses, we can but to a certain degree perceive any succession; which if exceeding quick, the sense of succession is lost, even in cases where 'tis evident, that there is a real succession. Let a cannon-bullet pass through a room, and in its way take with it any limb, or fleshy parts of a man, 'tis as clear as any demonstration can be, that it must strike successively the two sides of the room: 'tis also evident, that it must touch one part of the flesh first, and another after, and so in succession: and yet, I believe nobody, who ever felt the pain of such a shot, or heard the blow against the two distant walls, could perceive any succession, either in the pain or sound of so swift a stroke. Such a part of duration as this, wherein we perceive no succession, is that which we may call an instant, and is that which takes up the time of only one idea in our minds, without the succession of another; wherein therefore we perceive no succession at all.

§11. This also happens, where the motion is so slow, as not to supply a constant train of fresh ideas to the senses, as fast as the mind is capable of receiving new ones into it; and so other ideas of our own thoughts, having room to come into our minds, between those offered to our senses by the moving body, there the sense of motion is lost; and the body, though it really moves, yet not changing perceivable distance with some other bodies, as fast as the ideas of our own minds do naturally follow one another in train, the thing seems to stand still, as is evident in the hands of clocks, and shadows of sundials, and other constant, but slow motions, where though after certain intervals, we perceive, by the change of distance, that it hath moved, yet the motion itself we perceive not.

§12. This train the measure of other successions. So that to me it seems, that the constant and regular succession of ideas in a waking

man, is, as it were, the measure and standard of all other successions, whereof if any one either exceeds the pace of our ideas, as where two sounds or pains, etc., take up in their succession the duration of but one idea, or else where any motion or succession is so slow, as that it keeps not pace with the ideas in our minds, or the quickness, in which they take their turns; as when any one or more ideas, in their ordinary course, come into our mind between those which are offered to the sight by the different perceptible distances of a body in motion, or between sounds or smells following one another, there also the sense of a constant continued succession is lost, and we perceive it not, but with certain gaps of rest between.

§13. The mind cannot fix long on one invariable idea. If it be so, that the ideas of our minds, whilst we have any there, do constantly change and shift in a continual succession, it would be impossible, may any one say, for a man to think long of any one thing: By which if it be meant, that a man may have one self-same single idea a long time alone in his mind, without any variation at all, I think, in matter of fact, 'tis not possible, for which (not knowing how the ideas of our minds are framed, of what materials they are made, whence they have their light, and how they come to make their appearances,) I can give no other reason but experience: and I would have any one try, whether he can keep one unvaried single idea in his mind, without any other, for any considerable time together.

§14. For trial, let him take any figure, any degree of light or whiteness, or what other he pleases; and he will, I suppose, find it difficult to keep all other ideas out of his mind; but that some, either of another kind, or various considerations of that idea, (each of which considerations is a new idea) will constantly succeed one another in his thoughts, let him be as wary as he can.

§15. All that is in a man's power in this case, I think, is only to mind and observe what the ideas are, that take their turns in his understanding; or else to direct the sort, and call in such as he hath a desire or use of: but hinder the constant succession of fresh ones, I think he cannot, though he may commonly choose whether he will heedfully observe and consider them.

§16. Ideas, however made, include no sense of motion. Whether these several ideas in a man's mind be made by certain motions, I will not here dispute: but this I am sure, that they include no idea of

motion in their appearance; and if a man had not the idea of motion otherwise, I think he would have none at all, which is enough to my present purpose; and sufficiently shows, that the notice we take of the ideas of our own minds, appearing there one after another, is that which gives us the idea of succession and duration, without which we should have no such ideas at all. 'Tis not then motion, but the constant train of ideas in our minds, whilst we are waking, that furnishes us with the idea of duration, whereof motion no otherwise gives us any perception, than as it causes in our minds a constant succession of ideas, as I have before showed: and we have as clear an idea of succession and duration, by the train of other ideas succeeding one another in our minds, without the idea of any motion, as by the train of ideas caused by the uninterrupted sensible change of distance between two bodies, which we have from motion; and therefore we should as well have the idea of duration, were there no sense of motion at all.

§17. Time is duration set out by measures. Having thus got the idea of duration, the next thing natural for the mind to do, is to get some measure of this common duration, whereby it might judge of its different lengths, and consider the distinct order, wherein several things exist; without which, a great part of our knowledge would be confused, and a great part of history be rendered very useless. This consideration of duration, as set out by certain periods, and marked by certain measures or epochs, is that, I think, which most properly we call time.

§18. A good measure of time must divide its whole duration into equal periods. In the measuring of extension, there is nothing more required, but the application of the standard or measure we make use of to the thing, of whose extension we would be informed. But in the measuring of duration this cannot be done, because no two different parts of succession can be put together to measure one another; and nothing being a measure of duration but duration, as nothing is of extension, but extension, we cannot keep by us any standing unvarying measure of duration, which consists in a constant fleeting succession, as we can of certain lengths of extension, as inches, feet, yards, etc. marked out in permanent parcels of matter. Nothing then could serve well for a convenient measure of time, but what has divided the whole length of its duration into apparently equal portions, by constantly repeated periods. What portions of duration

are not distinguished, or considered as distinguished and measured by such periods, come not so properly under the notion of time, as appears by such phrases as these, viz. before all time, and when time shall be no more.

§19. The revolutions of the sun and Moon the properest measures of time. The diurnal and annual revolutions of the sun, as having been from the beginning of nature, constant, regular, and universally observable by all mankind, and supposed equal to one another, have been with reason made use of for the measure of duration. But the distinction of days and years, having depended on the motion of the sun, it has brought this mistake with it, that it has been thought, that motion and duration were the measure one of another. For men in the measuring of the length of time, having been accustomed to the ideas of minutes, hours, days, months, years, etc. which they found themselves upon any mention of time or duration, presently to think on, all which portions of time were measured out by the motion of those heavenly bodies, they were apt to confound time and motion; or at least to think, that they had a necessary connexion one with another: whereas any constant periodical appearance, or alteration of ideas in seemingly equidistant spaces of duration, if constant and universally observable, would have as well distinguished the intervals of time, as those that have been made use of. For supposing the sun, which some have taken to be a fire, had been lighted up at the same distance of time that it now every day comes about to the same meridian, and then gone out again about twelve hours after, and that in the space of an annual revolution, it had sensibly increased in brightness and heat, and so decreased again, would not such regular appearances serve to measure out the distances of duration to all that could observe it, as well without as with motion? For if the appearances were constant, universally observable, and in equidistant periods, they would serve mankind for measure of time as well, were the motion away.

§20. But not by their motion, but periodical appearances. For the freezing of water, or the blowing of a plant, returning at equidistant periods in all parts of the Earth, would as well serve men to reckon their years by, as the motions of the sun: and in effect we see, that some people in America counted their years by the coming of certain birds amongst them at their certain seasons, and leaving them at others. For a fit of an ague, the sense of hunger or thirst, a smell, or a

taste, or any other idea returning constantly at equidistant periods, and making itself universally be taken notice of, would not fail to measure out the course of succession, and distinguish the distances of time. Thus we see that men born blind count time well enough by years, whose revolutions yet they cannot distinguish by motions, that they perceive not: And I ask, whether a blind man, who distinguished his years either by the heat of summer, or cold of winter; by the smell of any flower of the spring, or taste of any fruit of the autumn, would not have a better measure of time than the Romans had before the reformation of their calendar by Julius C'sar, or many other people, whose years, notwithstanding the motion of the sun, which they pretend to make use of, are very irregular' And it adds no small difficulty to chronology, that the exact lengths of the years that several nations counted by, are hard to be known, they differing very much one from another, and I think I may say all of them from the precise motion of the sun: and if the sun moved from the creation to the flood constantly in the equator, and so equally dispersed its light and heat to all the habitable parts of the Earth, in days all of the same length, without its annual variations to the tropics, as a late ingenious author supposes, I do not think it very easy to imagine, that (notwithstanding the motion of the sun) men should in the antediluvian world, from the beginning count by years, or measure their time by periods, that had no sensible marks very obvious to distinguish them by.

§21. No two parts of duration can be certainly known to be equal. But perhaps it will be said without a regular motion, such as of the sun, or some other, how could it ever be known, that such periods were equal' To which I answer, the equality of any other returning appearances might be known by the same way that that of days was known, or presumed to be so at first, which was only by judging of them by the train of ideas had passed in men's minds in the intervals, by which train of ideas discovering inequality in the natural days, but none in the artificial days, the artificial days, or $\nu\chi\theta\eta\mu\epsilon\rho\alpha$ were guessed to be equal, which was sufficient to make them serve for a measure: though exacter search has since discovered inequality in the diurnal revolutions of the sun, and we know not whether the annual also be not unequal: these yet by their presumed and apparent equality, serve as well to reckon time by, (though not to measure the parts of duration exactly) as if they could be proved to be exactly equal. We must therefore carefully distinguish betwixt duration

itself, and the measures we make use of to judge of its length. Duration in itself, is to be considered as going on in one constant, equal, uniform course: but none of the measures of it, which we make use of, can be known to do so; nor can we be assured, that their assigned parts or periods are equal in duration one to another; for two successive lengths of duration, however measured, can never be demonstrated to be equal. The motion of the sun, which the world used so long, and so confidently for an exact measure of duration, has, as I said, been found in its several parts unequal: and though men have of late made use of a pendulum, as a more steady and regular motion, than that of the sun, (or to speak more truly) of the Earth; yet if any one should be asked how he certainly knows that the two successive swings of a pendulum are equal, it would be very hard to satisfy himself, that they are infallibly so: since we cannot be sure, that the cause of that motion, which is unknown to us, shall always operate equally; and we are sure that the medium in which the pendulum moves, is not constantly the same: either of which varying, may alter the equality of such periods, and thereby destroy the certainty and exactness of the measure by motion, as well as any other periods of other appearances, the notion of duration still remaining clear, though our measures of it cannot any of them be demonstrated to be exact. Since then no two portions of succession can be brought together, 'tis impossible ever certainly to know their equality. All that we can do for a measure of time, is to take such as have continual successive appearances at seemingly equidistant periods; of which seeming equality, we have no other measure, but such as the train of our own ideas have lodged in our memories, with the concurrence of other probable reasons, to persuade us of their equality.

§22. Time not the measure of motion. One thing seems strange to me, that whilst all men manifestly measured time by the motion of the great and visible bodies of the world, time yet should be defined to be the measure of motion: whereas 'tis obvious to everyone who reflects ever so little on it, that, to measure motion, space is as necessary to be considered as time; and those who look a little farther, will find also the bulk of the thing moved necessary to be taken into the computation by anyone who will estimate or measure motion, so as to judge right of it. Nor, indeed, does motion any otherwise conduce to the measuring of duration, than as it constantly brings about the return of certain sensible ideas, in seeming equidistant periods. For if the motion of the sun were as unequal as of a ship driven by unsteady

winds, sometimes very slow, and at others irregularly very swift; or if being constantly equally swift, it yet was not circular, and produced not the same appearances, it would not at all help us to measure time, any more than the seeming unequal motion of a comet does.

§23. Minutes, hours, and years, not necessary measures of duration. Minutes, hours, days, and years, are then, no more necessary to time or duration, than inches, feet, yards, and miles, marked out in any matter, are to extension. For though we in this part of the universe, by the constant use of them, as of periods set out by the revolutions of the sun, or as known parts of such periods, have fixed the ideas of such lengths of duration in our minds, which we apply to all parts of time, whose lengths we would consider; yet there may be other parts of the universe, where they no more use there measures of ours, than in Japan they do our inches, feet, or miles:but yet something analogous to them, there must be. For without some regular periodical returns, we could not measure ourselves,or signify to others, the length of any duration, though at the same time the world were as full of motion, as 'tis now, but no part of it disposed into regular and apparently equidistant revolutions. But the different measures that may be made use of for the account of time, do not at all alter the notion of duration, which is the thing to be measured, no more than the different standards of a foot and a cubit, alter the notion of extension to those, who make use of those different measures.

§24. The measure of time two ways applied. The mind having once got such a measure of time, as the annual revolution of the sun,can apply that measure to duration, wherein that measure itself did not exist, and with which in the reality of its being, it had nothing to do: For should one say, that Abraham was born in the 2712 year of the Julian period, 'tis altogether as intelligible, as reckoning from the beginning of the world, though there were so far back no motion of the sun, nor any motion at all. For though the Julian period be supposed to begin several hundred years before there were really either days, nights, or years, marked out by any revolutions of the sun, yet we reckon as right, and thereby measure durations as well, as if really at that time the sun had existed, and kept the same ordinary motion it doth now. The idea of duration equal to an annual revolution of the sun, is as easily applicable in our thoughts to duration, where no sun or motion was; as the idea of a foot or yard

taken from bodies here, can be applied in our thoughts to distances beyond the confines of the world, where are no bodies at all.

§25. Our measure of time applicable to duration before time. For supposing it were 5639 miles, or millions of miles, from this place to the remotest body of the universe, (for being finite, it must be at a certain distance), as we suppose it to be 5639 years from this time to the first existence of any body in the beginning of the world, we can, in our thoughts, apply this measure of a year to duration before the creation, or beyond the duration of bodies or motion, as we can this measure of a mile to space beyond the utmost bodies; and by the one measure duration, where there was no motion, as well as by the other measure space in our thoughts, where there is no body.

§26. If it be objected to me here, that, in this way of explaining of time, I have begged what I should not, viz. that the world is neither eternal, nor infinite; I answer, That to my present purpose, 'tis not needful, in this place, to make use of arguments, to evince the world to be finite, both in duration and extension: But it being at least as conceivable as the contrary, I have certainly the liberty to suppose it, as well as any one hath to suppose the contrary; and I doubt not but that everyone that will go about it, may easily conceive in his mind the beginning of motion, though not of all duration; and so may come to a step, and non ultra in his consideration of motion: so also in his thoughts he may set limits to body, and the extension belonging to it, but not to space where no body is, the utmost bounds of space and duration being beyond the reach of thought, as well as the utmost bounds of number are beyond the largest comprehension of the mind, and all for the same reason, as we shall see in another place.

§27. By the same means therefore, and from the same original that we come to have the idea of time, we have also that idea which we call eternity; viz. having got the idea of succession and duration, by reflecting on the train of our own ideas, caused in us either by the natural appearances of those ideas coming constantly of themselves into our waking thoughts, or else caused by external objects successively affecting our senses; and having from the revolutions of the sun got the ideas of certain lengths of duration, we can, in our thoughts, add such lengths of duration to one another, as often as we please, and apply them, so added, to durations past or to come: and this we can continue to do on, without bounds or limits, and proceed

in infinitum, and apply thus the length of the annual motion of the sun to duration, supposed before the sun's or any other motion had its being; which is no more difficult or absurd, than to apply the notion I have of the moving of a shadow, one hour today upon the sundial to the duration of something last night; v.g. the burning of a candle, which is now absolutely separate from all actual motion, and 'tis as impossible for the duration of that flame for an hour last night, to co-exist with any motion that now is, or for ever shall be, as for any part of duration, that was before the beginning of the world, to co-exist with the motion of the sun now. But yet this hinders not but that having the idea of the length of the motion of the shadow on a dial between the marks of two hours, I can as distinctly measure in my thoughts the duration of that candle-light last night, as I can the duration of anything that does now exist: and 'tis no more than to think, that had the sun shone then on the dial, and moved after the same rate it doth now, the shadow on the dial would have passed from one hour-line to another, whilst that flame of the candle lasted.

§28. Eternity. The notion of an hour, day, or year, being only the idea I have of the length of certain periodical regular motions, neither of which motions do ever all at once exist, but only in the ideas I have of them in my memory derived from my senses or reflection, I can with the same ease, and for the same reason, apply it in my thoughts to duration antecedent to all manner of motion, as well as to anything that is but a minute, or a day, antecedent to the motion, that at this very moment the sun is in. All things past are equally and perfectly at rest; and to this way of consideration of them are all one, whether they were before the beginning of the world, or but yesterday: the measuring of any duration by some motion depending not at all on the real co-existence of that thing to that motion, or any other periods of revolution, but the having a clear idea of the length of some periodical known motion, or other interval of duration, in my mind, and applying that to the duration of the thing I would measure.

§29. Hence we see that some men imagine the duration of the world from its first existence, to this present year 1689 to have been 5639 years, or equal to 5639 annual revolutions of the sun, and others a great deal more; as the Egyptians of old, who in the time of Alexander counted 23,000 years, from the reign of the sun; and the Chinese now, who account the world 3,269,000 years old, or more; which longer duration of the world, according to their computation,

though I should not believe to be true, yet I can equally imagine it with them, and as truly understand, and say one is longer than the other, as I understand, that Methusalem's life was longer than Enoch's. And if the common reckoning Of 5639 should be true, (as it may be, as well as any other assigned,) it hinders not at all my imagining what others mean, when they make the world 1000 years older, since every one may with the same facility imagine (I do not say believe) the world to be 50,000 years old, as 5639; and may as well conceive the duration of 50,000 years as 5639. Whereby it appears, that to the measuring the duration of anything by time, 'tis not requisite, that that thing should be co-existent to the motion we measure by, or any other periodical revolution; but it suffices to this purpose, that we have the idea of the length of any regular periodical appearances, which we can in our minds apply to duration, with which the motion or appearance never co-existed.

§30. Infinity in duration. For as in the history of the creation delivered by Moses, I can imagine that light existed three days before the sun was, or had any motion, barely by thinking, that the duration of light before the sun was created, was so long as (if the sun had moved then, as it doth now,) would have been equal to three of his diurnal revolutions; so by the same way I can have an idea of the chaos, or angels, being created before there was either light, or any continued motion, a minute, an hour, a day, a year, or 1000 years. For if I can but consider duration equal to one minute, before either the being or motion of any body, I can add one minute more till I come to 60; and by the same way of adding minutes, hours, or years, (i.e. such or such parts of the sun's revolutions, or any other period whereof I have the idea,) proceed in infinitum, and suppose a duration exceeding as many such periods as I can reckon, let me add whilst I will, which I think is the notion we have of eternity, of whose infinity we have no other notion, than we have of the infinity of number, to which we can add for ever without end.

§31. And thus I think 'tis plain, that from those two fountains of all knowledge before mentioned, viz. reflection and sensation, we get the ideas of duration, and the measures of it.

For first, by observing what passes in our minds, how our ideas there in train constantly some vanish and others begin to appear, we come by the idea of succession.

Secondly, by observing a distance in the parts of this succession, we get the idea of duration.

Thirdly, by sensation observing certain appearances, at certain regular and seeming equidistant periods, we get the ideas of certain lengths or measures of duration, as minutes, hours, days, years, etc.

Fourthly, by being able to repeat those measures of time, or ideas of stated length of duration, in our minds, as often as we will, we can come to imagine duration, where nothing does really endure or exist; and thus we imagine tomorrow, next year, or seven years hence.

Fifthly, by being able to repeat any such idea of any length of time, as of a minute, a year, or an age, as often as we will in our own thoughts, and add them one to another, without ever coming to the end of such addition, any nearer than we can to the end of number, to which we can always add, we come by the idea of eternity, as the future eternal duration of our souls, as well as the eternity of that infinite being, which must necessarily have always existed.

Sixthly, by considering any part of infinite duration, as set out by periodical measures, we come by the idea of what we call time in general.

Chapter XV Of Duration and Expansion, considered together

§1. Both capable of greater and less. Though we have in the precedent chapters dwelt pretty long on the considerations of space and duration; yet they being ideas of general concernment, that have something very abstruse and peculiar in their nature, the comparing them one with another may, perhaps, be of use for their illustration; and we may have the more clear and distinct conception of them, by taking a view of them together. Distance or space, in its simple abstract conception, to avoid confusion, I call expansion, to distinguish it from extension, which by some is used to express this distance only as 'tis in the solid parts of matter, and so includes, or at least intimates the idea of body: whereas the idea of pure distance includes no such thing. I prefer also the word expansion to space, because space is often applied to distance of fleeting successive parts, which never exist together, as well as to those which are

permanent. In both these, viz. expansion and duration, the mind has this common idea of continued lengths, capable of greater, or less quantities: For a man has as clear an idea of the difference of the length of an hour and a day, as of an inch and a foot.

§2. Expansion not bounded by matter. The mind, having got the idea of the length of any part of expansion, let it be a span, or a pace, or what length you will, can, as has been said, repeat that idea, and so adding it to the former, enlarge its idea of length, and make it equal to two spans, or two paces; and so as often as it will, till it equals the distance of any parts of the Earth one from another, and increase thus, till it amounts to the distance of the sun or remotest star. By such a progression as this, setting out from the place where 'tis, or any other place, it can proceed and pass beyond all those lengths, and find nothing to stop its going on, either in, or without body. 'Tis true, we can easily in our thoughts come to the end of solid extension; the extremity and bounds of all body, we have no difficulty to arrive at: but when the mind is there, it finds nothing to hinder its progress into this endless expansion; of that it can neither find nor conceive any end. Nor let any one say, that beyond the bounds of body, there is nothing at all, unless he will confine God within the limits of matter. Solomon, whose understanding was filled and enlarged with wisdom, seems to have other thoughts, when he says, 'Heaven, and the heaven of heavens, cannot contain thee.' And he, I think, very much magnifies to himself the capacity of his own understanding, who persuades himself, that he can extend his thoughts further than God exists, or imagine any expansion where he is not.

§3. Nor duration by motion. Just so is it in duration. The mind having got the idea of any length of duration, can double, multiply, and enlarge it, not only beyond its own, but beyond the existence of all corporeal beings, and all the measures of time, taken from the great bodies of all the world, and their motions. But yet everyone easily admits, that though we make duration boundless, as certainly 'tis, we cannot yet extend it beyond all being. God, every one easily allows, fills eternity; and 'tis hard to find a reason, why any one should doubt that He likewise fills immensity. His infinite being is certainly as boundless one way as another; and methinks it ascribes a little too much to matter to say, where there is no body, there is nothing.

§4. Why men more easily admit infinite duration than infinite

expansion. Hence, I think, we may learn the reason, why everyone familiarly, and without the least hesitation, speaks of, and supposes eternity, and sticks not to ascribe infinity to duration; but 'tis with more doubting and reserve, that many admit, or suppose the infinity of space. The reason whereof seems to me to be this, That duration and extension being used as names of affections belonging to other beings, we easily conceive in God infinite duration, and we cannot avoid doing so: but, not attributing to Him extension, but only to matter, which is finite, we are apter to doubt of the existence of expansion without matter; of which alone we commonly suppose it an attribute. And, therefore, when men pursue their thoughts of space, they are apt to stop at the confines of body; as if space were there at an end too, and reached no further. Or if their ideas upon consideration carry them further, yet they term what is beyond the limits of the universe, imaginary space; as if it were nothing, because there is no body existing in it. Whereas duration, antecedent to all body, and to the motions, which 'tis measured by, they never term imaginary: because 'tis never supposed void of some other real existence. And if the names of things may at all direct our thoughts towards the original of men's ideas, (as I am apt to think they may very much,) one may have occasion to think by the name duration, that the continuation of existence, with a kind of resistance to any destructive force, and the continuation of solidity, (which is apt to be confounded with, and if we will look into the minute anatomical parts of matter, is little different from hardness,) were thought to have some analogy, and gave occasion to words, so near of kin as *durare* and *durum esse*. And that *durare* is applied to the idea of hardness, as well as that of existence we see in Horace, *Epod*, 16. '*ferro duravit secula.*' But, be that as it will, this is certain, that whoever pursues his own thoughts, will find them sometimes launch out beyond the extent of body, into the infinity of space or expansion; the idea whereof is distinct and separate from body, and all other things: which may (to those who please) be a subject of further meditation.

§5. Time to duration, is as place to expansion. Time in general is to duration, as place to expansion. They are so much of those boundless oceans of eternity and immensity, as is set out and distinguished from the rest, as it were by landmarks; and so are made use of, to denote the position of finite real beings, in respect one to another, in those uniform infinite oceans of duration and space. These, rightly considered, are only ideas of determinate distances, from

certain known points fixed in distinguishable sensible things, and supposed to keep the same distance one from another. From such points fixed in sensible beings we reckon, and from them we measure our portions of those infinite quantities; which, so considered, are that which we call time and place. For duration and space being in themselves uniform and boundless, the order and position of things, without such known settled points, would be lost in them; and all things would lie jumbled in an incurable confusion.

§6. Time and place are taken for so much of either, as are set out by the existence and motion of bodies. Time and place taken thus, for determinate distinguishable portions of those infinite abysses of space and duration, set out, or supposed to be distinguished from the rest, by marks, and known boundaries, have each of them a two-fold acceptance.

First, time in general is commonly taken for so much of infinite duration, as is measured out by, and co-existent with the existence, and motions of the great bodies of the universe, as far as we know anything of them: and in this sense, time begins and ends with the frame of this sensible world, as in these phrases before-mentioned, before all time, or, when time shall be no more. Place likewise is taken sometimes for that portion of infinite space which is possessed by, and comprehended within the material world; and is thereby distinguished from the rest of expansion; though this may be more properly called extension than place. Within these two are confined, and by the observable parts of them are measured and determined the particular time or duration, and the particular extension and place, of all corporeal beings.

§7. Sometimes for so much of either, as we design by measures taken from the bulk or motion of bodies. Secondly, sometimes the word time is used in a larger sense, and is applied to parts of that infinite duration, not that were really distinguished and measured out by this real existence, and periodical motions of bodies that were appointed from the beginning to be for signs, and for seasons, and for days, and years, and are accordingly our measures of time; but such other portions too of that infinite uniform duration, which we, upon any occasion, do suppose equal to certain lengths of measured time; and so consider them as bounded and determined. For if we should suppose the creation, or fall of the angels, was at the beginning of the

Julian period, we should speak properly enough, and should be understood if we said, 'tis a longer time since the creation of angels than the creation of the world, by 7640 years: whereby we would mark out so much of that undistinguished duration, as we suppose equal to, and would have admitted, 7640 annual revolutions of the sun, moving at the rate it now does. And thus likewise, we sometimes speak of place, distance, or bulk in the great inane beyond the confines of the world, when we consider so much of that space, as is equal to, or capable to receive a body of any assigned dimensions, as a cubic-foot; or do suppose a point in it, at such a certain distance from any part of the universe.

§8. They belong to all finite beings. Where and when are questions belonging to all finite existences, and are by us always reckoned from some known parts of this sensible world, and from some certain epochs marked out to us by the motions observable in it. Without some such fixed parts or periods, the order of things would be lost, to our finite understandings, in the boundless invariable oceans of duration and expansion; which comprehend in them all finite beings, and in their full extent, belong only to the Deity. And therefore we are not to wonder, that we comprehend them not, and do so often find our thoughts at a loss, when we would consider them, either abstractly in themselves, or as any way attributed to the first incomprehensible Being. But when applied to any particular finite beings, the extension of any body is so much of that infinite space as the bulk of the body takes up. And place is the position of any body, when considered at a certain distance from some other. As the idea of the particular duration of anything, is an idea of that portion of infinite duration, which passes during the existence of that thing; so the time when the thing existed, is the idea of that space of duration, which passed between some known and fixed period of duration, and the being of that thing. One shows the distance of the extremities of the bulk, or existence of the same thing, as that 'tis a foot square, or lasted two years; the other shows the distance of it in place, or existence from other fixed points of space or duration, as that it was in the middle of Lincoln's Inn Fields, or the first degree of Taurus, and in the year of our Lord 1671, or the 1000 year of the Julian period. All which distances we measure by preconceived ideas of certain lengths of space and duration, as inches, feet, miles, and degrees, and in the other, minutes, days, and years, etc.

§9. All the parts of extension are extension; and all the parts of duration, are duration. There is one thing more, wherein space and duration have a great conformity, and that is, though they are justly reckoned amongst our simple ideas: yet none of the distinct ideas we have of either, is without all manner of composition; 'tis the very nature of both of them to consist of parts: but their parts being all of the same kind, and without the mixture of any other idea, hinder them not from having a place amongst simple ideas. Could the mind, as in number, come to so small a part of extension or duration, as excluded divisibility, that would be, as it were, the indivisible unit, or idea; by repetition of which, it would make its more enlarged ideas of extension and duration. But since the mind is not able to frame an idea of any space without parts, instead thereof it makes use of the common measures, which by familiar use, in each country, have imprinted themselves on the memory (as inches, and feet; or cubits and parasangs; and so seconds, minutes, hours, days, and years in duration:) the mind makes use, I say, of such ideas as these, as simple ones: and these are the component parts of larger ideas, which the mind, upon occasion, makes by the addition of such known lengths, which 'tis acquainted with. On the other side, the ordinary smallest measure we have of either is looked on as an unit in number, when the mind by division would reduce them into less fractions. Though on both sides, both in addition and division, either of space or duration, when the idea under consideration becomes very big, or very small, its precise bulk becomes very obscure and confused; and 'tis the number of its repeated additions or divisions, that alone remains clear and distinct, as will easily appear to anyone, who will let his thoughts loose in the vast expansion of space, or divisibility of matter. Every part of duration, is duration too; and every part of extension, is extension, both of them capable of addition or division in infinitum. But the least portions of either of them, whereof we have clear and distinct ideas, may perhaps be fittest to be considered by us, as the simple ideas of that kind, out of which our complex modes of space, extension, and duration, are made up, and into which they can again be distinctly resolved. Such a small part in duration, may be called a moment, and is the time of one idea in our minds, in the train of their ordinary succession there. The other, wanting a proper name, I know not whether I may be allowed to call a sensible point, meaning thereby the least particle of matter or space we can discern, which is ordinarily about a minute, and to the sharpest eyes seldom less than thirty seconds of a circle, whereof the eye is the centre.

§10. Their parts inseparable. Expansion and duration, have this further agreement, that though they are both considered by us as having parts, yet their parts are not separable one from another, no not even in thought: though the parts of bodies from whence we take our measure of the one; and the parts of motion, or rather the succession of ideas in our minds, from whence we take the measure of the other, may be interrupted and separated; as the one is often by rest, and the other is by sleep, which we call rest too.

§11. Duration is as a line, expansion as a solid. But yet there is this manifest difference between them, that the ideas of length, which we have of expansion, are turned every way, and so make figure, and breadth, and thickness; but duration is but as it were the length of one straight line, extended in infinitum, not capable of multiplicity, variation, or figure; but is one common measure of all existence whatsoever, wherein all things, whilst they exist, equally partake. For this present moment is common to all things, that are now in being, and equally comprehends that part of their existence, as much as if they were all but one single being; and we may truly say, they all exist in the same moment of time. Whether angels and spirits have any analogy to this, in respect to expansion, is beyond my comprehension: and perhaps, for us, who have understandings and comprehensions, suited to our own preservation, and the ends of our own being, but not to the reality and extent of all other beings, 'tis near as hard to conceive any existence, or to have an idea of any real being, with a perfect negation of all manner of expansion; as 'tis, to have the idea of any real existence, with a perfect negation of all manner of duration: and therefore what spirits have to do with space, or how they communicate in it, we know not. All that we know is, that bodies do each singly possess its proper portion of it, according to the extent of its solid parts; and thereby exclude all other bodies from having any share in that particular portion of space, whilst it remains there.

§12. Duration has never two parts together, expansion altogether. Duration, and time which is a part of it, is the idea we have of perishing distance, of which no two parts exist together, but follow each other in succession; an expansion is the idea of lasting distance, all whose parts exist together, and are not capable of succession. And therefore though we cannot conceive any duration without succession, nor can put it together in our thoughts that any being does now exist

tomorrow, or possess at once more than the present moment of duration; yet we can conceive the eternal duration of the Almighty far different from that of man, or any other finite being. Because man comprehends not in his knowledge, or power, all past and future things: his thoughts are but of yesterday, and he knows not what tomorrow will bring forth. What is once passed, he can never recall; and what is yet to come, he cannot make present. What I say of man, I say of all finite beings, who, though they may far exceed man in knowledge and power, yet are no more than the meanest creature, in comparison with God himself. Finite or any magnitude holds not any proportion to infinite. God's infinite duration being accompanied with infinite knowledge, and infinite power, He sees all things past and to come; and they are no more distant from his knowledge, no further removed from his sight, than the present: they all lie under the same view: and there is nothing which He cannot make exist each moment He pleases. For the existence of all things, depending upon his good pleasure; all things exist every moment, that he thinks fit to have them exist. To conclude, expansion and duration do mutually embrace, and comprehend each other; every part of space, being in every part of duration; and every part of duration, in every part of expansion. Such a combination of two distinct ideas is, I suppose, scarce to be found in all that great variety, we do or can conceive, and may afford matter to further speculation.

Chapter XVI Of Number

§1. Number the simplest and most universal idea. Amongst all the ideas we have, as there is none suggested to the mind by more ways, so there is none more simple, than that of unity, or one: it has no shadow of variety or composition in it: every object our senses are employed about; every idea in our understandings; every thought of our minds, brings this idea along with it. And therefore 'tis the most intimate to our thoughts, as well as 'tis, in its agreement to all other things, the most universal idea we have. For number applies itself to men, angels, actions, thoughts; everything that either doth exist, or can be imagined.

§2. Its modes made by addition. By repeating this idea in our minds, and adding the repetitions together, we come by the complex ideas of the modes of it. Thus, by adding one to one, we have the complex idea of a couple; by putting twelve units together, we have

the complex idea of a dozen; and so of a score, or a million, or any other number.

§3. Each mode distinct. The simple modes of number are of all other the most distinct; every the least variation, which is an unit, making each combination as clearly different from that which approacheth nearest to it, as the most remote; two being as distinct from one, as two hundred; and the idea of two, as distinct from the idea of three, as the magnitude of the whole earth, is from that of a mite. This is not so in other simple modes, in which 'tis not so easy, nor, perhaps, possible for us to distinguish betwixt two approaching ideas, which yet are really different. For who will undertake to find a difference between the white of this paper, and that of the next degree to it: or can form distinct ideas of every the least excess in extension'

§4. Therefore demonstrations in numbers the most precise. The clearness and distinctness of each mode of number from all others, even those that approach nearest, makes me apt to think that demonstrations in numbers, if they are not more evident and exact, than in extension, yet they are more general in their use, and more determinate in their application. Because the ideas of numbers are more precise, and distinguishable than in extension; where every equality and excess are not so easy to be observed, or measured; because our thoughts cannot in space arrive at any determined smallness, beyond which it cannot go, as an unit; and therefore the quantity or proportion of any the least excess cannot be discovered, which is clear otherwise in number, where, as has been said, 91 is as distinguishable from 90, as from 9000, though 91 be the next immediate excess to 90. But 'tis not so in extension, where, whatsoever is more than just a foot, or an inch, is not distinguishable from the standard of a foot, or an inch; and in lines, which appear of an equal length, one may be longer than the other by innumerable parts: nor can anyone assign an angle, which shall be the next biggest to a right one.

§5. Names necessary to numbers. By the repeating, as has been said, the idea of an unit, and joining it to another unit, we make thereof one collective idea, marked by the name two. And whosoever can do this, and proceed on, still adding one more to the last collective idea, which he had of any number, and gave a name to it, may count, or have ideas for several collections of units, distinguished

one from another, as far as he hath a series of names for following numbers, and a memory to retain that series, with their several names: all numeration being but still the adding of one unit more, and giving to the whole together, as comprehended in one idea, a new or distinct name or sign, whereby to know it from those before and after, and distinguish it from every smaller or greater multitude of units. So that he that can add one to one, and so to two, and so go on with his tale, taking still with him the distinct names belonging to every progression; and so again, by subtracting an unit from each collection, retreat and lessen them, is capable of all the ideas of numbers, within the compass of his language, or for which he hath names, though not, perhaps, of more. For the several simple modes of numbers, being in our minds, but so many combinations of units, which have no variety, nor are capable of any other difference but more or less, names or marks for each distinct combination, seem more necessary, than in any other sort of ideas. For without such names or marks, we can hardly well make use of numbers in reckoning, especially where the combination is made up of any great multitude of units; which put together without a name or mark, to distinguish that precise collection, will hardly be kept from being a heap in confusion.

§6. This, I think, to be the reason why some Americans, I have spoken with, (who were otherwise of quick and rational parts enough,) could not, as we do, by any means count to 1000; nor had any distinct idea of that number, though they could reckon very well to 20. Because their language being scanty, and accommodated only to the few necessities of a needy, simple life unacquainted either with trade or mathematics, had no words in it to stand for 1000; so that when they were discoursed with of those greater numbers, they would show the hairs of their head, to express a great multitude, which they could not number; which inability, I suppose, proceeded from their want of names. The Tououpinambos had no names for numbers above 5; any number beyond that, they made out by showing their fingers, and the fingers of others who were present: And I doubt not but we ourselves might distinctly number in words, a great deal further than we usually do, would we find out but some fit denominations to signify them by; whereas, in the way we take now to name them by millions of millions of millions, etc. 'tis hard to go beyond eighteen, or at most four and twenty decimal progressions, without confusion. But to show how much distinct names conduce to our well reckoning, or having useful ideas of numbers, let us see all these following figures in

one continued line, as the marks of one number: v. g.

Nonillions.Octillions.Septillions.Sextillions.Quintrillions.Quartrillions.Tr
Units.857324 162486 345896 437918 423147 248106 235421
261734 368149 623137The ordinary way of naming this number in
English, will be the often repeating of millions, of millions, of millions,
of millions, of millions,of millions, of millions, of millions, (which is
the denomination of the second six figures). In which way, it will be
very hard to have any distinguishing notions of this number: But
whether, by giving every six figures a new and orderly denomination,
these, and perhaps a great many more figures, in progression, might
not easily be counted distinctly,and ideas of them both got more easily
to ourselves, and more plainly signified to others, I leave it to be
considered. This I mention only to show how necessary distinct names
are to numbering, without pretending to introduce new ones of my
invention.

§7. Why children number not earlier. Thus children, either for
want of names to mark the several progressions of numbers, or not
having yet the faculty to collect scattered ideas into complex ones, and
range them in a regular order, and so retain them in their memories,
as is necessary to reckoning, do not begin to number very early, nor
proceed in it very far or steadily, till a good while after they are well
furnished with good store of other ideas: and one may often observe
them discourse and reason pretty well, and have very clear
conceptions of several other things, before they can tell 20.

And some, through the default of their memories, who cannot
retain the several combinations of numbers, with their names annexed
in their distinct orders, and the dependence of so long a train of
numeral progressions, and their relation one to another, are not able
all their lifetime, to reckon, or regularly go over any moderate series
of numbers. For he that will count twenty, or have any idea of that
number, must know that nineteen went before, with the distinct name
or sign of every one of them, as they stand marked in their order; for
wherever this fails, a gap is made, the chain breaks, and the progress
in numbering can go no further. So that to reckon right,'tis required,
1. that the mind distinguish carefully two ideas, which are different
one from another only by the addition or subtraction of one unit. 2.
that it retain in memory the names, or marks, of the several
combinations from an unit to that number; and that not confusedly,

and at random, but in that exact order, that the numbers follow one another; in either of which, if it trips, the whole business of numbering will be disturbed, and there will remain only the confused idea of multitude, but the ideas necessary to distinct numeration, will not be attained to.

§8. Number measures all measureables. This further is observable in number, that 'tis that which the mind makes use of in measuring all things, that by us are measurable, which principally are expansion and duration; and our idea of infinity, even when applied to those, seems to be nothing, but the infinity of number. For what else are our ideas of eternity and immensity, but the repeated additions of certain ideas of imagined parts of duration, and expansion, with the infinity of number, in which we can come to no end of addition' For such an inexhaustible stock, number, (of all other our ideas) most clearly furnishes us with, as is obvious to everyone. For let a man collect into one sum, as great a number as he pleases, this multitude, how great soever, lessens not one jot the power of adding to it, or brings him any nearer the end of the inexhaustible stock of number; where still there remains as much to be added, as if none were taken out. And this endless addition or addibility (if anyone like the word better) of numbers, so apparent to the mind, is that, I think, which gives us the clearest and most distinct idea of infinity: of which more in the following chapter.

Chapter XVII Of Infinity

§1. Infinity, in its original intention, attributed to space, duration, and number. He that would know what kind of idea 'tis to which we give the name of infinity, cannot do it better, than by considering to what infinity is by the mind more immediately attributed, and then how the mind comes to frame it.

Finite and infinite, seem to me to be looked upon by the mind, as the modes of quantity, and to be attributed primarily in their first designation only to those things, which have parts, and are capable of increase or diminution, by the addition or subtraction of any the least part: and such are the ideas of space, duration, and number, which we have considered in the foregoing chapters. 'Tis true, that we cannot but be assured, that the great God, of whom, and from whom are all things, is incomprehensibly infinite: but yet, when we apply to that first and supreme Being, our idea of infinite, in our weak and narrow thoughts, we do it primarily in respect of his duration and ubiquity; and, I think, more figuratively to his power, wisdom, and goodness, and other attributes, which are properly inexhaustible and incomprehensible, etc. For when we call them infinite, we have no other idea of this infinity, but what carries with it some reflection on, and imitation of that number or extent of the acts or objects of God's power, wisdom, and goodness, which can never be supposed so great, or so many, which these attributes will not always surmount and exceed, let us multiply them in our thoughts, as far as we can, with all the infinity of endless number. I do not pretend to say how these attributes are in God, who is infinitely beyond the reach of our narrow capacities: they do, without doubt, contain in them all possible perfection: but this, I say, is our way of conceiving them, and these our ideas of their infinity.

§2. The idea of finite easily got. Finite then, and infinite, being by the mind looked on as modifications of expansion and duration, the next thing to be considered, is, how the mind comes by them. As for the idea of finite, there is no great difficulty. The obvious portions of extension, that affect our senses, carry with them into the mind the idea of finite: and the ordinary periods of succession, whereby we measure time and duration, as hours, days, and years, are bounded lengths. The difficulty is, how we come by those boundless ideas of

eternity and immensity; since the objects, which we converse with, come so much short of any approach or proportion to that largeness.

§3. How we come by the idea of infinity. Everyone, that has any idea of any stated lengths of space, as a foot, finds that he can repeat that idea; and joining it to the former, make the idea of two foot; and by the addition of a third, three foot; and so on, without ever coming to an end of his additions, whether of the same idea of a foot, or if he pleases of doubling it, or any other idea he has of any length, as a mile, or diameter of the earth, or of the orbis magnus: for whichever of these he takes, and how often soever he doubles, or any otherwise multiplies it, he finds, that after he has continued his doubling in his thoughts, and enlarged his idea, as much as he pleases, he has no more reason to stop, nor is one jot nearer the end of such addition, than he was at first setting out; the power of enlarging his idea of space by further additions, remaining still the same, he hence takes the idea of infinite space.

§4. Our idea of space boundless. This, I think, is the way, whereby the mind gets the idea of infinite space. 'Tis a quite different consideration to examine, whether the mind has the idea of such a boundless space actually existing, since our ideas are not always proofs of the existence of things; but yet, since this comes here in our way, I suppose I may say, that we are apt to think, that space in itself is actually boundless, to which imagination, the idea of space or expansion of itself naturally leads us. For it being considered by us, either as the extension of body, or as existing by itself, without any solid matter taking it up, (for of such a void space, we have not only the idea, but I have proved, as I think, from the motion of body, its necessary existence), 'tis impossible the mind should be ever able to find or suppose any end of it, or be stopped anywhere in its progress in this space, how far soever it extends its thoughts. Any bounds made with body, even adamantine walls, are so far from putting a stop to the mind in its further progress in space and extension, that it rather facilitates and enlarges it: for so far as that body reaches, so far no one can doubt of extension; and when we are come to the utmost extremity of body, what is there, that can there put a stop, and satisfy the mind, that 'tis at the end of space, when it perceives 'tis not; nay, when 'tis satisfied that body itself can move into it' For if it be necessary for the motion of body, that there should be an empty

space, though ever so little, here amongst bodies; and if it be possible for body to move in or through that empty space; nay, 'tis impossible for any particle of matter to move but into an empty space, the same possibility of a body's moving into a void space, beyond the utmost bounds of body, as well as into a void space interspersed amongst bodies, will always remain clear and evident, the idea of empty pure space, whether within, or beyond the confines of all bodies, being exactly the same, differing not in nature, though in bulk; and there being nothing to hinder body from moving into it: so that wherever the mind places itself by any thought, either amongst, or remote from all bodies, it can, in this uniform idea of space, nowhere find any bounds, any end; and so must necessarily conclude it by the very nature and idea of each part of it, to be actually infinite.

§5. And so of duration. As by the power we find in ourselves of repeating, as often as we will, any idea of space, we get the idea of immensity; so, by being able to repeat the idea of any length of duration, we have in our minds, with all the endless addition of number, we come by the idea of eternity. For we find in ourselves, we can no more come to an end of such repeated ideas, than we can come to the end of number, which everyone perceives he cannot. But here again 'tis another question, quite different from our having an idea of eternity, to know whether there were any real being, whose duration has been eternal. And as to this, I say, he that considers something now existing, must necessarily come to Something eternal. But having spoke of this in another place, I shall say here no more of it, but proceed on to some other considerations of our idea of infinity.

§6. Why other ideas are not capable of infinity. If it be so, that our idea of infinity be got from the power, we observe in ourselves, of repeating without end our own ideas, it may be demanded, why we do not attribute infinity to other ideas, as well as those of space and duration; since they may be as easily, and as often repeated in our minds as the other: and yet nobody ever thinks of infinite sweetness, or infinite whiteness, though he can repeat the idea of sweet or white, as frequently as those of a yard, or a day. To which I answer, all the ideas, that are considered as having parts, and are capable of increase by the addition of any equal or less parts, afford us, by their repetition the idea of infinity; because with this endless repetition, there is continued an enlargement, of which there can be no end. But in other ideas 'tis not so. For to the largest idea of extension or duration, that I

at present have, the addition of any the least part makes an increase; but to the perfectest idea I have of the whitest whiteness, if I add another of a less or equal whiteness, (and of a whiter than I have, I cannot add the idea,) it makes no increase, and enlarges not my idea at all; and therefore the different ideas of whiteness, etc. are called degrees. For those ideas, that consist of parts, are capable of being augmented by every addition of the least part; but if you take the idea of white, which one parcel of snow yielded yesterday to our sight, and another idea of white from another parcel of snow you see today, and put them together in your mind, they embody, as it were, and run into one, and the idea of whiteness is not at all increased; and if we add a less degree of whiteness to a greater, we are so far from increasing, that we diminish it. Those ideas that consist not of parts cannot be augmented to what proportion men please, or be stretched beyond what they have received by their senses; but space, duration, and number, being capable of increase by repetition, leave in the mind an idea of an endless room for more; nor can we conceive anywhere a stop to a further addition or progression: and so those ideas alone lead our minds towards the thought of infinity.

§7. Difference between infinity of space, and space infinite. Though our idea of infinity arise from the contemplation of quantity, and the endless increase the mind is able to make in quantity, by the repeated additions of what portions thereof it pleases; yet I guess we cause great confusion in our thoughts, when we join infinity to any supposed idea of quantity the mind can be thought to have, and so discourse or reason about an infinite quantity, viz. an infinite space, or an infinite duration: for our idea of infinity being, as I think, an endless growing idea, but the idea of any quantity the mind has, being at that time terminated in that idea, (for be it as great as it will, it can be no greater than 'tis,) to join infinity to it, is, to adjust a standing measure to a growing bulk; and therefore I think 'tis not an insignificant subtilty, if I say, that we are carefully to distinguish between the idea of the infinity of space, and the idea of a space infinite: the first is nothing but a supposed endless progression of the mind, over what repeated ideas of space it pleases; but to have actually in the mind the idea of a space infinite, is to suppose the mind already passed over, and actually to have a view of all those repeated ideas of space, which an endless repetition can never totally represent to it; which carries in it a plain contradiction.

§8. We have no idea of infinite space. This, perhaps, will be a little plainer, if we consider it in numbers. The infinity of numbers, to the end of whose addition everyone perceives there is no approach, easily appears to anyone that reflects on it: But how clear soever this idea of the infinity of number be, there is nothing yet more evident, than the absurdity of the actual idea of an infinite number. Whatsoever positive ideas we have in our minds of any space, duration, or number, let them be ever so great, they are still finite; but when we suppose an inexhaustible remainder, from which we remove all bounds, and wherein we allow the mind an endless progression of thought, without ever completing the idea, there we have our idea of infinity: which, though it seems to be pretty clear, when we consider nothing else in it, but the negation of an end, yet when we would frame in our minds the idea of an infinite space or duration, that idea is very obscure, and confused, because 'tis made up of two parts, very different, if not inconsistent. For let a man frame in his mind an idea of any space or number, as great as he will; 'tis plain, the mind rests and terminates in that idea, which is contrary to the idea of infinity, which consists in a supposed endless progression. And therefore, I think, 'tis, that we are so easily confounded, when we come to argue and reason about infinite space or duration, etc. Because the parts of such an idea, not being perceived to be, as they are, inconsistent, the one side or other always perplexes, whatever consequences we draw from the other, as an idea of motion not passing on, would perplex anyone, who should argue from such an idea, which is not better than an idea of motion at rest; And such another seems to me to be the idea of a space, or (which is the same thing) a number infinite, i.e. of a space or number, which the mind actually has, and so views, and terminates in; and of a space or number, which, in a constant and endless enlarging, and progression, it can in thought never attain to. For how large soever an idea of space I have in my mind, 'tis no larger than 'tis that instant that I have it, though I be capable the next instant to double it, and so on in infinitum: for that alone is infinite, which has no bounds; and that the idea of infinity, in which our thoughts can find none.

§9. Number affords us the clearest idea of infinity. But of all other ideas, 'tis number, as I have said, which, I think, furnishes us with the clearest and most distinct idea of infinity, we are capable of.

For even in space and duration, when the mind pursues the idea

of infinity, it there makes use of the ideas and repetitions of numbers,as of millions of millions of miles, or years, which are so many distinct ideas, kept best by number from running into a confused heap, wherein the mind loses itself; and when it has added together as many millions, etc., as it pleases, of known lengths of space or duration, the clearest idea it can get of infinity, is the confused incomprehensible remainder of endless addible numbers, which affords no prospect of stop or boundary.

§10. Our different conceptions of the infinity of number, duration,and expansion. It will, perhaps, give us a little further light into the idea we have of infinity, and discover to us, that 'tis nothing but the infinity of number applied to determinate parts, of which we have in our minds the distinct ideas, if we consider, that number is not generally thought by us infinite, whereas duration and extension are apt to be so; which arises from hence, that in number we are at one end as it were: for there being in number nothing less than an unit, we there stop, and are at an end; but in addition, or increase of number,we can set no bounds: and so 'tis like a line, whereof one end terminating with us, the other is extended still forwards, beyond all that we can conceive; But in space and duration 'tis otherwise. For in duration we consider it, as if this line of number were extended both ways to an unconceivable, undeterminate, and infinite length; which is evident to anyone, that will but reflect on what consideration he hath of Eternity; which, I suppose, he will find to be nothing else,but the turning this infinity of number both ways, *à parte ante*, and *à parte post*, as they speak. For, when we would consider eternity, *à parte ante*, what do we but, beginning from ourselves, and the present time we are in, repeat in our minds the ideas of years, or ages, or any other assignable portion of duration past, with a prospect of proceeding, in such addition, with all the infinity of number; and when we would consider eternity, *à parte post*, we just after the same rate begin from ourselves, and reckon by multiplied periods yet to come, still extending that line of number, as before; and these two being put together, are that infinite duration we call eternity: which,as we turn our view either way, forwards or backwards, appears infinite, because we still turn that way the infinite end of number, i.e.the power still of adding more.

§11. The same happens also in space, wherein conceiving ourselves to be as it were in the centre, we do on all sides pursue

those indeterminable lines of number; and reckoning any way from ourselves, a yard, mile, diameter of the earth, or orbis magnus, by the infinity of number, we add others to them, as often as we will. And having no more reason to set bounds to those repeated ideas, than we have to set bounds to number, we have that indeterminable idea of immensity.

§12. Infinite divisibility. And since in any bulk of matter our thoughts can never arrive at the utmost divisibility, therefore there is an apparent infinity to us also in that, which has the infinity also of number, but with this difference, that in the former considerations of the infinity of space and duration, we only use addition of numbers; whereas this is like the division of an unit into its fractions, wherein the mind also can proceed in infinitum, as well as in the former additions; it being indeed but the addition still of new numbers: though in the addition of the one, we can have no more the positive idea of a space infinitely great, than in the division of the other, we can have the idea of a body infinitely little; our idea of infinity being, as I may say, a growing or fugitive idea, still in a boundless progression, that can stop nowhere.

§13. No positive idea of infinity. Though it be hard, I think, to find anyone so absurd, as to say, he has the positive idea of an actual infinite number; the infinity whereof lies only in a power still of adding any combination of units to any former number, and that as long and as much as one will; the like also being in the infinity of space and duration, which power leaves always to the mind room for endless additions; yet there be those who imagine they have positive ideas of infinite duration and space. It would, I think, be enough to destroy any such positive idea of infinite, to ask him that has it, whether he could add to it or no; which would easily show the mistake of such a positive idea. We can, I think, have no positive idea of any space or duration, which is not made up of, and commensurate to repeated numbers of feet or yards, or days and years; which are the common measures, whereof we have the ideas in our minds, and whereby we judge of the greatness of this sort of quantities. And therefore, since an idea of infinite space or duration must needs be made up of infinite parts, it can have no other infinity, than that of number, capable still of further addition; but not an actual positive idea of a number infinite. For, I think, 'tis evident, that the addition of finite things together (as are all lengths, whereof we have the positive

ideas) can never otherwise produce the idea of infinite, than as number does; which, consisting of additions of finite units one to another, suggests the idea of infinite, only by a power, we find we have of still increasing the sum, and adding more of the same kind; without coming one jot nearer the end of such progression.

§14. They who would prove their idea of infinite to be positive, seem to me to do it by a pleasant argument, taken from the negation of an end; which being negative, the negation of 'tis positive. He that considers, that the end is in body but the extremity or superficies of that body, will not, perhaps, be forward to grant, that the end is a bare negative: and he that perceives the end of his pen is black or white, will be apt to think, that the end is something more than a pure negation. Nor is it, when applied to duration, the bare negation of existence, but more properly the last moment of it. But if they will have the end to be nothing but the bare negation of existence, I am sure they cannot deny, but that the beginning is the first instant of being, and is not by anybody conceived to be a bare negation; and therefore, by their own argument, the idea of eternal, à parte ante, or of a duration without a beginning, is but a negative idea.

§15. What is positive, what negative in our idea of infinite. The idea of infinite, has, I confess, something of positive in all those things we apply to it. When we would think of infinite space or duration, we at first step usually make some very large idea, as, perhaps of millions of ages, or miles, which possibly we double and multiply several times. All that we thus amass together in our thoughts, is positive, and the assemblage of a great number of positive ideas of space or duration. But what still remains beyond this, we have no more a positive distinct notion of, than a mariner has of the depth of the sea, where having let down a large portion of his sounding-line, he reaches no bottom. Whereby he knows the depth to be so many fathoms, and more; but how much the more is, he hath no distinct notion at all: and could he always supply new line, and find the plummet always sink, without ever stopping, he would be something in the posture of the mind reaching after a complete and positive idea of infinity. In which case, let this line be ten, or ten thousand fathoms long, it equally discovers what is beyond it; and gives only this confused, and comparative idea, that this is not all, but one may yet go farther. So much as the mind comprehends of any space, it has a positive idea of:

but in endeavouring to make it infinite, it being always enlarging, always advancing, the idea is still imperfect and incomplete. So much space as the mind takes a view of, in its contemplation of greatness, is a clear picture, and positive in the understanding: but infinite is still greater. 1. Then the idea of so much is positive and clear. 2. The idea of greater, is also clear; but 'tis but a comparative idea. 3. The idea of so much greater, as cannot be comprehended, and this is plainly negative; not positive. For he has no positive clear idea of the largeness of any extension, (which is that sought for in the idea of infinite), that has not a comprehensive idea of the dimensions of it: and such, nobody, I think, pretends to, in what is infinite. For to say a man has a positive clear idea of any quantity, without knowing how great 'tis, is as reasonable as to say, he has the positive clear idea of the number of the sands on the sea-shore, who knows not how many they be, but only that they are more than twenty. For just such a perfect and positive idea has he of an infinite space or duration, who says 'tis larger than the extent or duration of ten, one hundred, one thousand, or any other number of miles, or years, whereof he has, or can have, a positive idea; which is all the idea, I think, we have of infinite. So that what lies beyond our positive idea towards infinity, lies in obscurity, and has the indeterminate confusion of a negative idea, wherein I know, I neither do nor can comprehend all I would, it being too large for a finite and narrow capacity: and that cannot but be very far from a positive complete idea, wherein the greatest part of what I would comprehend, is left out, under the undeterminate intimation of being still greater. For to say, that, having in any quantity measured so much, or gone so far, you are not yet at the end, is only to say, that the quantity is greater. So that the negation of an end in any quantity, is, in other words, only to say, that 'tis bigger: and a total negation of an end, is but the carrying this bigger still with you, in all the progressions your thoughts shall make in quantity; and adding this idea of still greater, to all the ideas you have, or can be supposed to have of quantity. Now, whether such an idea as that, be positive, I leave any one to consider.

§16. We have no positive idea of an infinite duration. I ask those, who say they have a positive idea of eternity, whether their idea of duration includes in it succession, or not? If it does not, they ought to show the difference of their notion of duration, when applied to an eternal being, and to a finite; since, perhaps, there may be others, as well as I, who will own to them their weakness of understanding in

this point; and acknowledge, that the notion they have of duration forces them to conceive, that whatever has duration, is of a longer continuance today, than it was yesterday. If, to avoid succession in external existence, they return to the punctum stans of the schools, I suppose, they will thereby very little mend the matter, or help us to a more clear and positive idea of infinite duration, there being nothing more inconceivable to me, than duration without succession. Besides, that punctum stans, if it signify anything, being not quantum, finite or infinite, cannot belong to it. But, if our weak apprehensions cannot separate succession from any duration whatsoever, our idea of eternity can be nothing but of infinite succession of moments of duration, wherein anything does exist; and whether anyone has, or can have, a positive idea of an actual infinite number, I leave him to consider, till his infinite number be so great, that he himself can add no more to it; and as long as he can increase it, I doubt, he himself will think the idea he hath of it, a little too scanty for positive infinity.

§17. I think it unavoidable for every considering rational creature, that will but examine his own, or any other existence, to have the notion of an eternal wise Being, who had no beginning: and such an idea of infinite duration, I am sure I have. But this negation of a beginning, being but the negation of a positive thing, scarce gives me a positive idea of infinity; which whenever I endeavour to extend my thoughts to, I confess myself at a loss, and find I cannot attain any clear comprehension of it.

§18. No positive idea of infinite space. He that thinks he has a positive idea of infinite space, will, when he considers it, find that he can no more have a positive idea of the greatest, than he has of the least space. For in this latter, which seems the easier of the two, and more within our comprehension, we are capable only of a comparative idea of smallness, which will always be less than any one, whereof we have the positive idea. All our positive ideas of any quantity, whether great or little, have always bounds, though our comparative idea, whereby we can always add to the one, and take from the other, hath no bounds. For that which remains, either great or little, not being comprehended in that positive idea, which we have, lies in obscurity: and we have no other idea of it, but of the power of enlarging the one, and diminishing the other, without ceasing. A pestle and mortar will as soon bring any particle of matter to indivisibility, as the acutest thought of a mathematician: and a

surveyor may as soon with his chain, measure out infinite space, as a philosopher, by the quickest flight of mind reach it, or by thinking comprehend it, which is to have a positive idea of it. He that thinks on a cube of an inch diameter, has a clear and positive idea of it in his mind, and so can frame one of $1/2$ a $1/4$ $1/8$, and so on till he has the idea in his thoughts of something very little; but yet reaches not the idea of that incomprehensible littleness, which division can produce. What remains of smallness, is as far from his thoughts, as when he first began; and therefore he never comes at all to have a clear and positive idea of that smallness, which is consequent to infinite divisibility.

§19. What is positive, what negative, in our idea of infinite. Everyone that looks towards infinity, does, as I have said, at first glance make some very large idea of that which he applies it to, let it be space, or duration; and possibly he wearies his thoughts, by multiplying in his mind that first large idea: but yet by that he comes no nearer to the having a positive clear idea of what remains, to make up a positive infinite, than the country-fellow had of the water, which was yet to come, and pass the channel of the river where he stood:

‘Rusticus expectat dum defluat amnis, at ille

Labitur, et labetur in omne volubilis ‘vum.’

§20. Some think they have a positive idea of eternity, and not space. There are some I have met with, that put so much difference between infinite duration, and infinite space, that they persuade themselves, that they have a positive idea of eternity, but that they have not, nor can have any idea of infinite space. The reason of which mistake, I suppose to be this, that finding by a due contemplation of causes and effects, that ’tis necessary to admit some Eternal Being, and so to consider the real existence of that Being, as taken up, and commensurate to their idea of eternity: but on the other side, not finding it necessary, but on the contrary, apparently absurd, that body should be infinite, they forwardly conclude, they can have no idea of infinite space, because they can have no idea of infinite matter. Which consequence, I conceive, is very ill collected, because the existence of matter is no ways necessary to the existence of space, no more than the existence of motion, or the sun, is necessary to duration, though duration used to be measured by it: and I doubt not but a man may have the idea of ten thousand miles square, without any body so big,

as well as the idea of ten thousand years, without any body so old. It seems as easy to me to have the idea of space empty of body, as to think of the capacity of a bushel without corn, or the hollow of a nutshell without a kernel in it: it being no more necessary, that there should be existing a solid body infinitely extended, because we have an idea of the infinity of space, than 'tis necessary that the world should be eternal, because we have an idea of infinite duration: and why should we think our idea of infinite space, requires the real existence of matter to support it, when we find, that we have as clear an idea of infinite duration to come, as we have of infinite duration past? Though, I suppose, nobody thinks it conceivable, that anything does, or has existed in that future duration. Nor is it possible to join our idea of future duration, with present or past existence, any more than 'tis possible to make the ideas of yesterday, today, and tomorrow, to be the same; or bring ages past and future together, and make them contemporary. But if these men are of the mind, that they have clearer ideas of infinite duration, than of infinite space, because 'tis past doubt, that God has existed from all eternity, but there is no real matter coextended with infinite space: yet those philosophers who are of opinion, that infinite space is possessed by God's infinite omnipresence, as well as infinite duration by his eternal existence, must be allowed to have as clear an idea of infinite space, as of infinite duration; though neither of them, I think, has any positive idea of infinity in either case. For whatsoever positive ideas a man has in his mind of any quantity, he can repeat it, and add it to the former, as easy as he can add together the ideas of two days, or two paces, which are positive ideas of lengths he has in his mind, and so on, as long as he pleases: whereby, if a man had a positive idea of infinite, either duration, or space, he could add two infinities together; nay, make one infinite infinitely bigger than another, absurdities too gross to be confuted.

§21. Supposed positive ideas of infinity cause of mistakes. But yet if after all this, there be men who persuade themselves, that they have clear positive comprehensive ideas of infinity, 'tis fit they enjoy their privilege: and I should be very glad (with some others, that I know, who acknowledge they have none such) to be better informed by their communication. For I have been hitherto apt to think, that the great and inextricable difficulties, which perpetually involve all discourses concerning infinity, whether of space, duration, or divisibility, have been the certain marks of a defect in our ideas of infinity, and the

disproportion the nature thereof has to the comprehension of our narrow capacities. For whilst men talk and dispute of infinite space or duration, as if they had as complete and positive ideas of them, as they have of the names they use for them, or as they have of a yard, or an hour, or any other determinate quantity, 'tis no wonder, if the incomprehensible nature of the thing, they discourse of, or reason about, leads them into perplexities and contradictions; and their minds be overlaid by an object too large and mighty to be surveyed and managed by them.

§22. All these ideas from sensation and reflection. If I have dwelt pretty long on the consideration of duration, space, and number, and what arises from the contemplation of them, Infinity, 'tis possibly no more than the matter requires, there being few simple ideas, whose modes give more exercise to the thoughts of men, than those do. I pretend not to treat of them in their full latitude: it suffices to my design, to show, how the mind receives them, such as they are from sensation and reflection; and how even the idea we have of infinity, how remote soever it may seem to be from any object of sense, or operation of our mind, has, nevertheless, as all our other ideas, its original there. Some mathematicians, perhaps, of advanced speculations, may have other ways to introduce into their minds ideas of infinity: but this hinders not, but that they themselves, as well as all other men, got the first ideas, which they had of infinity, from sensation and reflection, in the method we have here set down.

Chapter XVIII Of other Simple Modes

§1. Modes of motion. Though I have in the foregoing chapters, shown how from simple ideas taken in by sensation, the mind comes to extend itself even to infinity; which however it may, of all others, seem most remote from any sensible perception, yet at last hath nothing in it, but what is made out of simple ideas; received into the mind by the senses, and afterwards there put together, by the faculty the mind has to repeat its own ideas; Though, I say, these might be instances enough of simple modes of the simple ideas of sensation; and suffice to show, how the mind comes by them: yet I shall for method's sake, though briefly, give an account of some few more, and then proceed to more complex ideas.

§2. To slide, roll, tumble, walk, creep, run, dance, leap, skip, and

abundance of others, that might be named, are words, which are no sooner heard, but everyone, who understands English, has presently in his mind distinct ideas, which are all but the different modifications of motion. Modes of motion answer those of extension: swift and slow are two different ideas of motion, the measures whereof are made of the distances of time and space put together: so they are complex ideas comprehending time and space with motion.

§3. Modes of sounds. The like variety have we in sounds. Every articulate word is a different modification of sound; by which we see, that from the sense of hearing by such modifications, the mind may be furnished with distinct ideas, to almost an infinite number.

Sounds also, besides the distinct cries of birds and beasts, are modified by diversity of notes of different length put together, which make that complex idea called a tune, which a musician may have in his mind, when he hears or makes no sound at all, by reflecting on the ideas of those sounds, so put together silently in his own fancy.

§4. Modes of colours. Those of colours are also very various: some we take notice of, as the different degrees, or as they are termed, shades of the same colour. But since we very seldom make assemblages of colours, either for use or delight, but figure is taken in also, and has its part in it, as in painting, weaving, needle-works, etc. those which are taken notice of, do most commonly belong to mixed modes, as being made up of ideas of divers kinds, viz. figure and colour, such as beauty, rainbow, etc.

§5. Modes of tastes. All compounded tastes and smells, are also modes made up of the simple ideas of those senses. But they being such, as generally we have no names for, are less taken notice of, and cannot be set down in writing; and therefore must be left without enumeration, to the thoughts and experience of my reader.

§6. Some simple modes have no names. In general it may be observed, that those simple modes which are considered but as different degrees of the same simple idea, though they are in themselves many of them very distinct ideas; yet have ordinarily no distinct names, nor are much taken notice of, as distinct ideas, where the difference is but very small between them. Whether men have neglected these modes, and given no names to them, as wanting measures nicely to distinguish them; or because when they were so

distinguished, that knowledge would not be of general, or necessary use, I leave it to the thoughts of others; 'Tis sufficient to my purpose to show, that all our simple ideas come to our minds only by sensation and reflection; and that when the mind has them, it can variously repeat and compound them, and so make new complex ideas. But, though white, red, or sweet, etc. have not been modified, or made into complex ideas, by several combinations, so as to be named, and thereby ranked into species; yet some others of the simple ideas, viz. those of unity, duration, motion, etc., above instanced in, as also power and thinking have been thus modified to a great variety of complex ideas, with names belonging to them.

§7. Why some modes have, and others have not names. The reason whereof, I suppose, has been this, That the great concernment of men being with men one amongst another, the knowledge of men, and their actions, and the signifying of them to one another, was most necessary; and therefore they made ideas of actions very nicely modified, and gave those complex ideas names, that they might the more easily record and discourse of those things, they were daily conversant in, without long ambages and circumlocutions; and that the things they were continually to give and receive information about, might be the easier and quicker understood. That this is so, and that men in framing different complex ideas, and giving them names, have been much governed by the end of speech in general, (which is a very short and expedite way of conveying their thoughts one to another), is evident in the names, which in several arts have been found out, and applied to several complex ideas of modified actions, belonging to their several trades, for dispatch sake, in their direction or discourses about them. Which ideas are not generally framed in the minds of men not conversant about these operations. And thence the words that stand for them, by the greatest part of men of the same language, are not understood. v.g. coltshire, drilling, filtration, cohobation, are words standing for certain complex ideas, which being seldom in the minds of any but those few, whose particular employments do at every turn suggest them to their thoughts, those names of them are not generally understood but by smiths, and chymists; who having framed the complex ideas, which these words stand for, and having given names to them, or received them from others, upon hearing of these names in communication, readily conceive those ideas in their minds; as by cohobation all the simple ideas of distilling, and the pouring the liquor, distilled from anything,

back upon the remaining matter, and distilling it again. Thus we see, that there are great varieties of simple ideas, as of tastes and smells, which have no names; and of modes many more. which either not having been generally enough observed, or else not being of any great use to be taken notice of in the affairs and converse of men, they have not had names given to them, and so pass not for species. This we shall have occasion hereafter to consider more at large, when we come to speak of words.

Chapter XIX Of the Modes of Thinking

§1. Sensation, remembrance, contemplation, etc. When the mind turns its view inwards upon itself, and contemplates its own actions, thinking is the first that occurs. In it the mind observes a great variety of modifications, and from thence receives distinct ideas. Thus the perception, which actually accompanies, and is annexed to any impression on the body, made by an external object, being distinct from all other modifications of thinking, furnishes the mind with a distinct idea, which we call sensation; which is, as it were, the actual entrance of any idea into the understanding by the senses. The same idea, when it again recurs without the operation of the like object on the external sensory, is remembrance: if it be sought after by the mind, and with pain and endeavour found, and brought again in view, 'tis recollection: if it be held there long under attentive consideration, 'tis contemplation: when ideas float in our mind, without any reflection or regard of the understanding, 'tis that, which the French call *reverie*; our language has scarce a name for it: when the ideas that offer themselves, (for as I have observed in another place, whilst we are awake, there will always be a train of ideas succeeding one another in our minds,) are taken notice of, and, as it were, registered in the memory, 'tis attention: when the mind with great earnestness, and of choice, fixes its view on any idea, considers it on all sides, and will not be called off by the ordinary solicitation of other ideas, 'tis that we call intention, or study: sleep, without dreaming, is rest from all these. and dreaming itself, is the having of ideas (whilst the outward senses are stopped, so that they receive not outward objects with their usual quickness) in the mind, not suggested by any external objects, or known occasion; nor under any choice or conduct of the understanding at all: and whether that, which we call *ecstasy*, be not dreaming with the eyes open, I leave to be examined.

§2. These are some few instances of those various modes of thinking, which the mind may observe in itself, and so have as distinct ideas of, as it hath of white and red, a square or a circle. I do not pretend to enumerate them all, nor to treat at large of this set of ideas, which are got from reflection: that would be to make a volume. It suffices to my present purpose, to have shown here, by some few examples, of what sort these ideas are, and how the mind comes by them; especially since I shall have occasion hereafter to treat more at large of reasoning, judging, volition, and knowledge, which are some of the most considerable operations of the mind, and modes of thinking.

§3. The various degrees of attention in thinking. But, perhaps, it may not be an unpardonable digression, nor wholly impertinent to our present design, if we reflect here upon the different state of the mind in thinking, which those instances of attention, reverie, and dreaming, etc., before mentioned, naturally enough suggest. That there are ideas, some or other, always present in the mind of a waking man, everyone's experience convinces him; though the mind employs itself about them with several degrees of attention. Sometimes the mind fixes itself with so much earnestness on the contemplation of some objects, that it turns their ideas on all sides; remarks their relations and circumstances; and views every part so nicely and with such intention, that it shuts out all other thoughts, and takes no notice of the ordinary impressions made then on the senses, which at another season would produce very sensible perceptions: at other times, it barely observes the train of ideas, that succeed in the understanding, without directing, and pursuing any of them: and at other times, it lets them pass almost quite unregarded, as faint shadows that make no impression.

§4. Hence 'tis probable that thinking is the action, not essence of the soul. This difference of intention, and remission of the mind in thinking, with a great variety of degrees, between earnest study, and very near minding nothing at all, everyone, I think, has experimented in himself. Trace it a little further, and you find the mind in sleep, retired as it were from the senses, and out of the reach of those motions made on the organs of sense, which at other times produce very vivid and sensible ideas. I need not, for this, instance in those, who sleep out whole stormy nights, without hearing the thunder, or seeing the lightning, or feeling the shaking of the house, which are

sensible enough to those, who are waking. But in this retirement of the mind from the senses, it often retains a yet more loose and incoherent manner of thinking, which we call dreaming; and, last of all, sound sleep closes the scene quite, and puts an end to all appearances. This, I think, almost everyone has experience of in himself, and his own observation without difficulty leads him thus far. That which I would further conclude from hence, is, that since the mind can sensibly put on, at several times, several degrees of thinking; and be sometimes even in a waking man, so remiss, as to have thoughts dim and obscure to that degree, that they are very little removed from none at all; and at last, in the dark retirements of sound sleep, loses the sight perfectly of all ideas whatsoever: since, I say, this is evidently so in matter of fact, and constant experience, I ask, whether it be not probable, that thinking is the action, and not the essence of the soul ‘ Since the operations of agents will easily admit of intention and remission; but the essences of things, are not conceived capable of any such variation. But this by the by.

Chapter XX Of Modes of Pleasure and Pain

§1. Pleasure and pain, simple ideas. Amongst the simple ideas, which we receive both from sensation and reflection, pain and pleasure are two very considerable ones. For as in the body, there is sensation barely in itself, or accompanied with pain or pleasure, so the thought, or perception of the mind is simply so, or else accompanied also with pleasure or pain, delight, or trouble, call it how you please. These, like other simple ideas, cannot be described, nor their names defined; the way of knowing them, is, as of the simple ideas of the senses, only by experience. For to define them by the presence of good or evil, is no otherwise to make them known to us, than by making us reflect on what we feel in ourselves, upon the several and various operations of good and evil upon our minds, as they are differently applied to, or considered by us.

§2. Good and evil, what. Things then are good or evil, only in reference to pleasure or pain. That we call good, which is apt to cause or increase pleasure, or diminish pain in us; or else to procure, or preserve us the possession of any other good, or absence of any evil. And, on the contrary, we name that evil, which is apt to produce or increase any pain, or diminish any pleasure in us; or else to procure us any evil, or deprive us of any good. By pleasure and pain, I must be

understood to mean of body or mind, as they are commonly distinguished; though in truth, they be only different constitutions of the mind, sometimes occasioned by disorder in the body, sometimes by thoughts of the mind.

§3. Our passions moved by good and evil. Pleasure and pain, and that which causes them, good and evil, are the hinges on which our passions turn: and if we reflect on ourselves, and observe how these, under various considerations, operate in us; what modifications or tempers of mind, what internal sensations (if I may so call them,) they produce in us, we may thence form to ourselves the ideas of our passions.

§4. Love. Thus anyone reflecting upon the thought he has of the delight, which any present, or absent thing is apt to produce in him, has the idea we call love. For when a man declares in autumn, when he is eating them, or in spring, when there are none, that he loves grapes, 'tis no more, but that the taste of grapes delights him; let an alteration of health or constitution destroy the delight of their taste, and he then can be said to love grapes no longer.

§5. Hatred. On the contrary, the thought of the pain, which anything present or absent is apt to produce in us, is what we call hatred. Were it my business here, to inquire any further than into the bare ideas of our passions, as they depend on different modifications of pleasure and pain, I should remark, that our love and hatred of inanimate insensible beings, is commonly founded on that pleasure and pain which we receive from their use and application any way to our senses, though with their destruction: but hatred or love, to beings capable of happiness or misery, is often the uneasiness or delight, which we find in ourselves arising from a consideration of their very being, or happiness. Thus the being and welfare of a man's children or friends, producing constant delight in him, he is said constantly to love them. But it suffices to note, that our ideas of love and hatred, are but the dispositions of the mind, in respect of pleasure and pain in general, however caused in us.

§6. Desire. The uneasiness a man finds in himself upon the absence of anything, whose present enjoyment carries the idea of delight with it, is that we call desire, which is greater or less, as that uneasiness is more or less vehement. Where, by the by, it may perhaps be of some use to remark, that the chief if not only spur to human

industry and action, is uneasiness. For whatsoever good is proposed, if its absence carries no displeasure nor pain with it, if a man be easy and content without it, there is no desire of it, nor endeavour after it; there is no more but a bare velleity, the term used to signify the lowest degree of desire, and that which is next to none at all, when there is so little uneasiness in the absence of anything, that it carries a man no further than some faint wishes for it, without any more effectual or vigorous use of the means to attain it. Desire also is stopped or abated by the opinion of the impossibility or unattainableness of the good proposed, as far as the uneasiness is cured or allayed by that consideration. This might carry our thoughts further, were it seasonable in this place.

§7. Joy. Joy is a delight of the mind, from the consideration of the present or assured approaching possession of a good; and we are then possessed of any good, when we have it so in our power, that we can use it when we please. Thus a man almost starved, has joy at the arrival of relief, even before he has the pleasure of using it: and a father, in whom the very well-being of his children causes delight, is always, as long as his children are in such a state, in the possession of that good; for he needs but to reflect on it to have that pleasure.

§8. Sorrow. Sorrow is uneasiness in the mind, upon the thought of a good lost, which might have been enjoyed longer; or the sense of a present evil.

§9. Hope. Hope is that pleasure in the mind, which everyone finds in himself, upon the thought of a probable future enjoyment of a thing, which is apt to delight him.

§10. Fear. Fear is an uneasiness of the mind, upon the thought of future evil likely to befall us.

§11. Despair. Despair is the thought of the unattainableness of any good, which works differently in men's minds, sometimes producing uneasiness or pain, sometimes rest and indolency.

§12. Anger. Anger is uneasiness or discomposure of the mind, upon the receipt of any injury, with a present purpose of revenge.

§13. Envy. Envy is an uneasiness of mind, caused by the

consideration of a good we desire, obtained by one, we think should not have had it before us.

§14. What passions all men have. These two last, envy and anger, not being caused by pain and pleasure simply in themselves, but having in them some mixed considerations of ourselves and others, are not therefore to be found in all men, because those other parts of valuing their merits, or intending revenge, is wanting in them: But all the rest terminating purely in pain and pleasure, are, I think, to be found in all men. For we love, desire, rejoice, and hope, only in respect of pleasure; we hate, fear, and grieve only in respect of pain ultimately: In fine, all these passions are moved by things, only as they appear to be the causes of pleasure and pain, or to have pleasure or pain some way or other annexed to them. Thus we extend our hatred usually to the subject, (at least if a sensible or voluntary agent,) which has produced pain in us, because the fear it leaves, is a constant pain: but we do not so constantly love what has done us good; because pleasure operates not so strongly on us as, pain, and because we are not so ready to have hope, it will do so again. But this by the by.

§15. Pleasure and pain, what. By pleasure and pain, delight and uneasiness, I must all along be understood (as I have above intimated) to mean, not only bodily pain and pleasure, but whatsoever delight or uneasiness is felt by us, whether arising from any grateful, or unacceptable sensation or reflection.

§16. 'Tis further to be considered, that, in reference to the passions, the removal or lessening of a pain is considered, and operates as a pleasure: and the loss or diminishing of a pleasure, as a pain.

§17. Shame. The passions too have most of them in most persons operations on the body, and cause various changes in it: which not being always sensible, do not make a necessary part of the idea of each passion. For shame, which is an uneasiness of the mind, upon the thought of having done something, which is indecent, or will lessen the valued esteem, which others have for us, has not always blushing accompanying it.

§18. These instances to show how our ideas of the passions are got from sensation and reflection. I would not be mistaken here, as if I meant this as a Discourse of the Passions; they are many more than

those I have here named: and those I have taken notice of, would each of them require a much larger and more accurate discourse. I have only mentioned these here, as so many instances of modes of pleasure and pain resulting in our minds, from various considerations of good and evil. I might perhaps, have instanced in other modes of pleasure and pain more simple than these, as the pain of hunger and thirst, and the pleasure of eating and drinking to remove them; the pain of tender eyes, and the pleasure of music; pain from captious uninformative wrangling, and the pleasure of rational conversation with a friend, or of well directed study in the search and discovery of truth. But the passions being of much more concernment to us, I rather made choice to instance in them, and show how the ideas we have of them, are derived from sensation or reflection.

Chapter XXI Of Power

§1. This idea how got. The mind being every day informed, by the senses, of the alteration of those simple ideas it observes in things without; and taking notice how one comes to an end, and ceases to be, and another begins to exist which was not before; reflecting also on what passes within itself, and observing a constant change of its ideas, sometimes by the impression of outward objects on the senses, and sometimes by the determination of its own choice; and concluding from what it has so constantly observed to have been, that the like changes will for the future be made in the same things, by like agents, and by the like ways, considers in one thing the possibility of having any of its simple ideas changed, and in another the possibility of making that change; and so comes by that idea which we call power. Thus we say, fire has a power to melt gold, i.e. to destroy the consistency of its insensible parts, and consequently its hardness, and make it fluid; and gold has a power to be melted; that the Sun has a power to blanch wax, and wax a power to be blanched by the Sun, whereby the yellowness is destroyed, and whiteness made to exist in its room. In which, and the like cases, the power we consider is in reference to the change of perceivable ideas. For we cannot observe any alteration to be made in, or operation upon anything, but by the observable change of its sensible ideas; nor conceive any alteration to be made, but by conceiving a change of some of its ideas.

§2. Power, active and passive. Power thus considered is twofold, viz. as able to make, or able to receive any change: the one

may be called active, and the other passive power. Whether matter be not wholly destitute of active power, as its author God is truly above all passive power; and whether the intermediate state of created spirits be not that alone, which is capable of both active and passive power, may be worth consideration. I shall not now enter into that inquiry, my present business being not to search into the original of power, but how we come by the idea of it. But since active powers make so great a part of our complex ideas of natural substances, (as we shall see hereafter,) and I mention them as such, according to common apprehension; yet they being not, perhaps, so truly active powers, as our hasty thoughts are apt to represent them, I judge it not amiss, by this intimation, to direct our minds to the consideration of God and spirits, for the clearest idea of active power.

§3. Power includes relation. I confess power includes in it some kind of relation, (a relation to action or change,) as indeed which of our ideas, of what kind soever, when attentively considered, does not? For our ideas of extension, duration, and number, do they not all contain in them a secret relation of the parts? Figure and motion have something relative in them much more visibly: and sensible qualities, as colours and smells, etc. what are they but the powers of different bodies, in relation to our perception, etc.? And if considered in the things themselves, do they not depend on the bulk, figure, texture, and motion of the parts? All which include some kind of relation in them. Our idea therefore of power, I think, may well have a place amongst other simple ideas, and be considered as one of them, being one of those, that make a principal ingredient in our complex ideas of substances, as we shall hereafter have occasion to observe.

§4. The clearest idea of active power had from spirit. We are abundantly furnished with the idea of passive power, by almost all sorts of sensible things. In most of them we cannot avoid observing their sensible qualities, nay, their very substances to be in a continual flux: and therefore with reason we look on them as liable still to the same change. Nor have we of active power (which is the more proper signification of the word power) fewer instances. Since whatever change is observed, the mind must collect a power somewhere, able to make that change, as well as a possibility in the thing itself to receive it. But yet, if we will consider it attentively, bodies, by our senses, do not afford us so clear and distinct an idea of active power, as we have from reflection on the operations of our minds. For all power relating

to action, and there being but two sorts of action whereof we have an idea, viz. thinking and motion, let us consider whence we have the clearest ideas of the powers, which produce these actions. 1. Of thinking, body affords us no idea at all, 'tis only from reflection that we have that: 2. neither have we from body any idea of the beginning of motion. A body at rest affords us no idea of any active power to move; and when 'tis set in motion itself, that motion is rather a passion than an action in it. For when the ball obeys the stroke of a billiard-stick, 'tis not any action of the ball, but bare passion: also when by impulse it sets another ball in motion that lay in its way, it only communicates the motion it had received from another, and loses in itself so much as the other received; which gives us but a very obscure idea of an active power of moving in body, whilst we observe it only to transfer, but not produce any motion. For 'tis but a very obscure idea of power, which reaches not the production of the action, but the continuation of the passion. For so is motion in a body impelled by another: the continuation of the alteration made in it from rest to motion being little more an action than the continuation of the alteration of its figure by the same blow, is an action. The idea of the beginning of motion, we have only from reflection on what passes in ourselves, where we find by experience, that barely by willing it, barely by a thought of the mind, we can move the parts of our bodies, which were before at rest. So that it seems to me, we have from the observation of the operation of bodies by our senses, but a very imperfect obscure idea of active power, since they afford us not any idea in themselves of the power to begin any action, either motion or thought. But if, from the impulse, bodies are observed to make one upon another, anyone thinks he has a clear idea of power, it serves as well to my purpose; sensation being one of those ways, whereby the mind comes by its ideas: only I thought it worth while to consider here by the way, whether the mind doth not receive its idea of active power clearer from reflection on its own operations, than it doth from any external sensation.

§5. Will and understanding, two powers. This at least I think evident, that we find in ourselves a power to begin or forbear, continue or end several actions of our minds, and motions of our bodies, barely by a thought or preference of the mind ordering, or, as it were, commanding the doing or not doing such or such a particular action. This power which the mind has, thus to order the consideration of any idea, or the forbearing to consider it; or to prefer the motion of any

part of the body to its rest, and vice versa in any particular instance, is that which we call the will. The actual exercise of that power, by directing any particular action, or its forbearance, is that which we call volition or willing. The forbearance of that action, consequent to such order or command of the mind, is called voluntary. And whatsoever action is performed without such a thought of the mind, is called involuntary. The power of perception is that which we call the understanding. Perception, which we make the act of the understanding, is of three sorts: 1. the perception of ideas in our minds. 2. The perception of the signification of signs. 3. The perception of the connexion or repugnancy, agreement or disagreement, that there is between any of our ideas. All these are attributed to the understanding, or perceptive power, though it be the two latter only that use allows us to say we understand.

§6. Faculties. These powers of the mind, viz. of perceiving, and of preferring, are usually called by another name: and the ordinary way of speaking is, that the understanding and will are two faculties of the mind; a word proper enough, if it be used as all words should be, so as not to breed any confusion in men's thoughts, by being supposed (as I suspect it has been) to stand for some real beings in the soul that performed those actions of understanding and volition. For when we say the will is the commanding and superior faculty of the soul; that 'tis, or is not free; that it determines the inferior faculties; that it follows the dictates of the understanding, etc., though these, and the like expressions, by those that carefully attend to their own ideas, and conduct their thoughts more by the evidence of things, than the sound of words, may be understood in a clear and distinct sense, yet I suspect, I say, that this way of speaking of faculties, has misled many into a confused notion of so many distinct agents in us, which had their several provinces and authorities, and did command, obey, and perform several actions, as so many distinct beings; which has been no small occasion of wrangling, obscurity, and uncertainty in questions relating to them.

§7. Whence the ideas of liberty and necessity. Everyone, I think, finds in himself a power to begin or forbear, continue or put an end to several actions in himself. From the consideration of the extent of this power of the mind over the actions of the man, which everyone finds in himself, arise the ideas of liberty and necessity.

§8. Liberty, what. All the actions that we have any idea of, reducing themselves, as has been said, to these two, viz. thinking and motion, so far as a man has power to think, or not to think, to move, or not to move, according to the preference or direction of his own mind, so far is a man free. Wherever any performance or forbearance are not equally in a man's power; wherever doing or not doing will not equally follow upon the preference of his mind directing it, there he is not free, though perhaps the action may be voluntary. So that the idea of liberty, is the idea of a power in any agent to do or forbear any particular action, according to the determination or thought of the mind, whereby either of them is preferred to the other; where either of them is not in the power of the agent to be produced by him according to his volition, there he is not at liberty, that agent is under necessity. So that liberty cannot be, where there is no thought, no volition, no will; but there may be thought, there may be will, there may be volition, where there is no liberty. A little consideration of an obvious instance or two, may make this clear.

§9. Supposes the understanding, and will. A tennis-ball, whether in motion by the stroke of a racket, or lying still at rest, is not by anyone taken to be a free agent. If we inquire into the reason, we shall find 'tis, because we conceive not a tennis-ball to think, and consequently not to have any volition, or preference of motion to rest, or vice versa; and therefore has not liberty, is not a free agent; but all its both motion and rest, come under our idea of necessary, and are so called. Likewise a man falling into the water, (a bridge breaking under him), has not herein liberty, is not a free agent. For though he has volition, though he prefers his not falling to falling; yet the forbearance of that motion not being in his power, the stop or cessation of that motion follows not upon his volition; and therefore therein he is not free. So a man striking himself, or his friend, by a convulsive motion of his arm, which 'tis not in his power, by volition or the direction of his mind, to stop, or forbear; nobody thinks he has in this liberty; every one pities him, as acting by necessity and constraint.

§10. Belongs not to volition. Again, suppose a man be carried, whilst fast asleep, into a room, where is a person he longs to see and speak with; and be there locked fast in, beyond his power to get out: he awakes, and is glad to find himself in so desirable

company, which he stays willingly in, i.e. prefers his stay to going away. I ask, is not this stay voluntary? I think, nobody will doubt it; and yet being locked fast in, 'tis evident he is not at liberty not to stay, he has not freedom to be gone. So that liberty is not an idea belonging to volition, or preferring; but to the person having the power of doing, or forbearing to do, according as the mind shall choose or direct. Our idea of liberty reaches as far as that power, and no farther. For wherever restraint comes to check that power, or compulsion takes away that indifferency of ability on either side to act, or to forbear acting, there liberty, and our notion of it, presently ceases.

§11. Voluntary opposed to involuntary, not to necessary. We have instances enough, and often more than enough in our own bodies. A man's heart beats, and the blood circulates, which 'tis not in his power by any thought or volition to stop; and therefore in respect of these motions, where rest depends not on his choice, nor would follow the determination of his mind, if it should prefer it, he is not a free agent. Convulsive motions agitate his legs, so that though he wills it ever so much, he cannot by any power of his mind stop their motion, (as in that odd disease called Chorea Sancti Viti), but he is perpetually dancing: he is not at liberty in this action, but under as much necessity of moving, as a stone that falls, or a tennisball struck with a racket. On the other side, a palsy or the stocks hinder his legs from obeying the determination of his mind, if it would thereby transfer his body to another place. In all these there is want of freedom, though the sitting still even of a paralytic, whilst he prefers it to a removal, is truly voluntary. Voluntary, then is not opposed to necessary; but to involuntary. For a man may prefer what he can do, to what he cannot do; the state he is in, to its absence or change; though necessity has made it in itself unalterable.

§12. Liberty, what. As 'tis in the motions of the body, so 'tis in the thoughts of our minds; where any one is such, that we have power to take it up, or lay it by, according to the preference of the mind, there we are at liberty. A waking man being under the necessity of having some ideas constantly in his mind, is not at liberty to think, or not to think; no more than he is at liberty, whether his body shall touch any other, or no: but whether he will remove his contemplation from one idea to another, is many times in his choice; and then he is in respect of his ideas, as much at liberty, as he is in respect of bodies he rests on: he can at pleasure remove himself from one to another. But yet

some ideas to the mind, like some motions to the body, are such; as in certain circumstances it cannot avoid, nor obtain their absence by the utmost effort it can use. A man on the rack is not at liberty to lay by the idea of pain, and divert himself with other contemplations: and sometimes a boisterous passion hurries our thoughts, as a hurricane does our bodies, without leaving us the liberty of thinking on other things, which we would rather choose. But as soon as the mind regains the power to stop or continue, begin or forbear, any of these motions of the body without, or thoughts within, according as it thinks fit to prefer either to the other, we then consider the man as a free agent again.

§13. Necessity, what. Wherever thought is wholly wanting, or the power to act or forbear according to the direction of thought, there necessity takes place. This in an agent capable of volition, when the beginning or continuation of any action is contrary to that preference of his mind, is called compulsion; when the hindering or stopping any action is contrary to his volition, 'tis called restraint. Agents that have no thought, no volition at all, are in everything necessary agents.

§14. Liberty belongs not to the will. If this be so, (as I imagine 'tis,) I leave it to be considered, whether it may not help to put an end to that long agitated, and, I think, unreasonable, because unintelligible, question, viz. whether man's will be free or no. For if I mistake not, it follows from what I have said, that the question itself is altogether improper; and 'tis as insignificant to ask, whether man's will be free, as to ask, whether his sleep be swift, or his virtue square: liberty being as little applicable to the will, as swiftness of motion is to sleep, or squareness to virtue. Every one would laugh at the absurdity of such a question as either of these; because 'tis obvious, that the modifications of motion belong not to sleep, nor the difference of figure to virtue: and when anyone well considers it, I think he will as plainly perceive, that liberty, which is but a power, belongs only to agents, and cannot be an attribute or modification of the will, which is also but a power.

§15. Volition. Such is the difficulty of explaining and giving clear notions of internal actions by sounds, that I must here warn my reader that ordering, directing, choosing, preferring, etc., which I have made use of, will not distinctly enough express volition, unless he will reflect on what he himself does, when he wills. For example, preferring

which seems perhaps best to express the act of volition, does it not precisely. For though a man would prefer flying to walking, yet who can say he ever wills it? Volition, 'tis plain, is an act of the mind knowingly exerting that dominion it takes itself to have over any part of the man, by employing it in, or withholding it from any particular action. And what is the will, but the faculty to do this? And is that faculty anything more in effect, than a power, the power of the mind to determine its thought, to the producing, continuing, or stopping any action, as far as it depends on us? For can it be denied, that whatever agent has a power to think on its own actions, and to prefer their doing or omission either to other, has that faculty called will? Will then is nothing but such a power. Liberty, on the other side, is the power a man has to do or forbear doing any particular action, according as its doing or forbearance has the actual preference in the mind, which is the same thing as to say, according as he himself wills it.

§16. Powers belong to agents. 'Tis plain then, that the will is nothing but one power or ability, and freedom another power or ability: so that to ask, whether the will has freedom, is to ask, whether one power has another power, one ability another ability; a question at first sight too grossly absurd to make a dispute, or need an answer. For who is it that sees not, that powers belong only to agents, and are attributes only of substances, and not of powers themselves? So that this way of putting the question viz. whether the will be free? is in effect to ask, whether the will be a substance, an agent or at least to suppose it, since freedom can properly be attributed to nothing else. If freedom can with any propriety of speech be applied to power, it may be attributed to the power that is in a man, to produce, or forbear producing motion in parts of his body, by choice or preference; which is that which denominates him free, and is freedom itself. But if any one should ask, whether freedom were free, he would be suspected not to understand well what he said; and he would be thought to deserve Midas's ears, who knowing that rich was a denomination from the possession of riches, should demand whether riches themselves were rich.

§17. However the name faculty, which men have given to this power called the will, and whereby they have been led into a way of talking of the will as acting, may, by an appropriation that disguises its true sense, serve a little to palliate the absurdity; yet the will in truth, signifies nothing but a power, or ability to prefer or choose: and

when the will, under the name of a faculty, is considered, as 'tis, barely as an ability to do something, the absurdity, in saying 'tis free, or not free, will easily discover itself. For if it be reasonable to suppose and talk of faculties, as distinct beings, that can act, (as we do, when we say the will orders, and the will is free,) 'tis fit that we should make a speaking faculty, and a walking faculty, and a dancing faculty, by which these actions are produced, which are but several modes of motion; as well as we make the will and understanding to be faculties, by which the actions of choosing and perceiving are produced, which are but several modes of thinking: and we may as properly say, that 'tis the singing faculty sings, and the dancing faculty dances; as that the will chooses, or that the understanding conceives; or, as is usual, that the will directs the understanding, or the understanding obeys, or obeys not the will: it being altogether as proper and intelligible to say, that the power of speaking directs the power of singing, or the power of singing obeys or disobeys the power of speaking.

§18. This way of talking causes confusion of thought. This way of talking, nevertheless, has prevailed, and, as I guess, produced great confusion. For these being all different powers in the mind, or in the man, to do several actions, he exerts them as he thinks fit: but the power to do one action, is not operated on by the power of doing another action. For the power of thinking operates not on the power of choosing, nor the power of choosing on the power of thinking; no more than the power of dancing operates on the power of singing, or the power of singing on the power of dancing, as anyone, who reflects on it, will easily perceive: and yet this is it, which we say, when we thus speak, that the will operates on the understanding, or the understanding on the will.

§19. I grant, that this or that actual thought, may be the occasion of volition, or exercising the power a man has to choose; or the actual choice of the mind, the cause of actual thinking on this or that thing: as the actual singing of such a tune, may be the occasion of dancing such a dance, and the actual dancing of such a dance the occasion of singing such a tune. But in all these, 'tis not one power that operates on another: but 'tis the mind that operates, and exerts these powers; 'tis the man that does the action; 'tis the agent that has power, or is able to do. For powers are relations, not agents: and that which has the power or not the power to operate, is that alone which is, or is not free, and not the power itself: for freedom, or not freedom, can belong

to nothing but what has, or has not a power to act.

§20. Liberty belongs not to the will. The attributing to faculties that which belonged not to them, has given occasion to this way of talking: but the introducing into discourses concerning the mind, with the name of faculties, a notion of their operating, has, I suppose, as little advanced our knowledge in that part of ourselves, as the great use and mention of the like invention of faculties, in the operations of the body, has helped us in the knowledge of physic. Not that I deny there are faculties, both in the body and mind: they both of them have their powers of operating, else neither the one nor the other could operate. For nothing can operate, that is not able to operate; and that is not able to operate, that has no power to operate. Nor do I deny, that those words, and the like, are to have their place in the common use of languages, that have made them current. It looks like too much affectation wholly to lay them by: and philosophy itself, though it likes not a gaudy dress, yet when it appears in public, must have so much complacency, as to be clothed in the ordinary fashion and language of the country, so far as it can consist with truth and perspicuity. But the fault has been, that faculties have been spoken of, and represented, as so many distinct agents. For it being asked, what it was that digested the meat in our stomachs^c it was a ready, and very satisfactory answer, to say, that it was the digestive faculty. What was it that made anything come out of the body^d the expulsive faculty. What moved^e the motive faculty. and so in the mind, the intellectual faculty, or the understanding, understood; and the elective faculty, or the will, willed or commanded: which is in short to say, that the ability to digest, digested; and the ability to move, moved; and the ability to understand, understood. For faculty, ability, and power, I think, are but different names of the same things: which ways of speaking, when put into more intelligible words, will, I think, amount to thus much; That digestion is performed by something that is able to digest; motion by something able to move; and understanding by something able to understand. And in truth it would be very strange, if it should be otherwise; as strange as it would be for a man to be free without being able to be free.

§21. But to the agent or man. To return then to the inquiry about liberty, I think the question is not proper, whether the will be free, but whether a man be free. Thus, I think,¹ That so far as any one can, by the direction or choice of his mind, preferring the existence of any

action, to the non-existence of that action, and vice versa, make it to exist, or not exist, so far he is free. For if I can, by a thought, directing the motion of my finger, make it move, when it was at rest, or vice versa, 'tis evident, that in respect of that, I am free: and if I can, by a like thought of my mind, preferring one to the other, produce either words, or silence, I am at liberty to speak, or hold my peace; and as far as this power reaches, of acting, or not acting, by the determination of his own thought preferring either, so far is a man free. For how can we think anyone freer than to have the power to do what he will? And so far as anyone can, by preferring any action to its not being, or rest to any action, produce that action or rest, so far can he do what he will. For such a preferring of action to its absence, is the willing of it: and we can scarce tell how to imagine any being freer, than to be able to do what he wills. So that in respect of actions, within the reach of such a power in him, a man seems as free, as 'tis possible for freedom to make him.

§22. In respect of willing, a man is not free. But the inquisitive mind of man, willing to shift off from himself, as far as he can, all thoughts of guilt, though it be by putting himself into a worse state, than that of fatal necessity, is not content with this: freedom, unless it reaches further than this, will not serve the turn: and it passes for a good plea, that a man is not free at all, if he be not as free to will as he is to act, what he wills. Concerning a man's liberty, there yet therefore is raised this further question, whether a man be free to will; which, I think, is what is meant, when 'tis disputed, whether the will be free. And as to that I imagine.

§23. 2. That willing, or volition, being an action, and freedom consisting in a power of acting, or not acting, a man in respect of willing or the act of volition, when any action in his power is once proposed to his thoughts, as presently to be done, cannot be free. The reason whereof is very manifest. for it being unavoidable that the action depending on his will, should exist, or not exist; and its existence, or not existence, following perfectly the determination, and preference of his will, he cannot avoid willing the existence, or not existence of that action; 'tis absolutely necessary that he will the one, or the other; i.e. prefer the one to the other; since one of them must necessarily follow; and that which does follow, follows by the choice and determination of his mind that is, by his willing it: for if he did not will it, it would not be. So that in respect of the act of willing, a

man in such a case is not free: liberty consisting in a power to act, or not to act which, in regard of volition, a man, upon such a proposal, has not. For 'tis unavoidably necessary to prefer the doing, or forbearance, of an action in a man's power, which is once so proposed to his thoughts; a man must necessarily will the one or the other of them, upon which preference, or volition, the action, or its forbearance, certainly follows, and is truly voluntary: but the act of volition, or preferring one of the two, being that which he cannot avoid, a man in respect of that act of willing, is under a necessity, and so cannot be free; unless necessity and freedom can consist together, and a man can be free and bound at once.

§24. This then is evident, that in all proposals of present action, a man is not at liberty to will, or not to will because he cannot forbear willing: liberty consisting in a power to act, or to forbear acting, and in that only. For a man that sits still, is said yet to be at liberty, because he can walk if he wills it. But if a man sitting still has not a power to remove himself, he is not at liberty; so likewise a man falling down a precipice, though in motion, is not at liberty, because he cannot stop that motion, if he would. This being so, 'tis plain that a man that is walking, to whom 'tis proposed to give off walking, is not at liberty, whether he will determine himself to walk, or give off walking, or no: he must necessarily prefer one, or the other of them; walking or not walking: and so 'tis in regard of all other actions in our power so proposed, which are the far greater number. For considering the vast number of voluntary actions that succeed one another every moment that we are awake, in the course of our lives, there are but few of them that are thought on or proposed to the will, till the time they are to be done: and in all such actions, as I have shown, the mind in respect of willing, has not a power to act, or not to act, wherein consists liberty: the mind in that case has not a power to forbear willing; it cannot avoid some determination concerning them, let the consideration be as short, the thought as quick, as it will, it either leaves the man in the state he was before thinking, or changes it; continues the action, or puts an end to it. Whereby 'tis manifest, that it orders and directs one in preference to, or with neglect of the other, and thereby either the continuation or change becomes unavoidably voluntary.

§25. The will determined by something without it. Since then 'tis plain that in most cases a man is not at liberty, whether he will will,

or no; the next thing demanded is, whether a man be at liberty to will which of the two he pleases, motion or rest. This question carries the absurdity of it so manifestly in itself, that one might thereby sufficiently be convinced, that liberty concerns not the will. For to ask, whether a man be at liberty to will either motion, or rest; speaking, or silence; which he pleases, is to ask, whether a man can will, what he wills; or be pleased with what he is pleased with. A question, which, I think, needs no answer: and they, who can make a question of it, must suppose one will to determine the acts of another, and another to determinate that; and so on in infinitum.

§26. To avoid these, and the like absurdities, nothing can be of greater use, than to establish in our minds determined ideas of the things under consideration. If the ideas of liberty, and volition, were well fixed in our understandings, and carried along with us in our minds, as they ought, through all the questions that are raised about them, I suppose, a great part of the difficulties, that perplex men's thoughts, and entangle their understandings, would be much easier resolved; and we should perceive where the confused signification of terms, or where the nature of the thing caused the obscurity.

§27. Freedom. First then, 'tis carefully to be remembered, that freedom consists in the dependence of the existence, or not existence of any action, upon our volition of it, and not in the dependence of any action, or its contrary, on our preference. A man standing on a cliff, is at liberty to leap twenty yards downwards into the sea, not because he has a power to do the contrary action, which is to leap twenty yards upwards, for that he cannot do: but he is therefore free, because he has a power to leap, or not to leap. But if a greater force than his, either holds him fast, or tumbles him down, he is no longer free in that case: because the doing, or forbearance of that particular action is, no longer in his power. He that is a close prisoner, in a room twenty feet square, being at the north side of his chamber, is at liberty to walk twenty feet southward, because he can walk, or not walk it: but is not, at the same time, at liberty, to do the contrary; i.e. to walk twenty foot northward.

In this then consists freedom, viz. in our being able to act, or not to act, according as we shall choose or will.

§28. Volition what. Secondly, we must remember, that volition, or willing, is an act of the mind directing its thought to the production

of any action, and thereby exerting its power to produce it. To avoid multiplying of words, I would crave leave here, under the word action, to comprehend the forbearance too of any action proposed; sitting still, or holding one's peace, when walking or speaking are proposed, though mere forbearances, requiring as much the determination of the will, and being often as weighty in their consequences, as the contrary actions, may, on that consideration, well enough pass for actions too: but this I say, that I may not be mistaken, if for brevity's sake I speak thus.

§29. What determines the will. Thirdly, the will being nothing but a power in the mind to direct the operative faculties of a man to motion or rest, as far as they depend on such direction. To the question, what is it determines the will? The true and proper answer is, the mind. For that which determines the general power of directing, to this or that particular direction, is nothing but the agent itself exercising the power it has, that particular way. If this answer satisfies not, 'tis plain the meaning of the question, 'what determines the will?' is this, what moves the mind, in every particular instance, to determine its general power of directing, to this or that particular motion or rest? And to this I answer, the motive for continuing in the same state or action, is only the present satisfaction in it; the motive to change is always some uneasiness: nothing setting us upon the change of state, or upon any new action, but some uneasiness. This is the great motive that works on the mind to put it upon action, which for shortness' sake we will call determining of the will, which I shall more at large explain.

§30. Will and desire must not be confounded. But in the way to it, it will be necessary to premise, that though I have above endeavoured to express the act of volition, by choosing, preferring, and the like terms, that signify desire as well as volition, for want of other words to mark that act of the mind, whose proper name is willing or volition; yet it being a very simple act, whosoever desires to understand what 'tis, will better find it by reflecting on his own mind, and observing what it does, when it wills, than by any variety of articulate sounds whatsoever. This caution of being careful not to be misled by expressions, that do not enough keep up the difference between the will, and several acts of the mind, that are quite distinct from it, I think the more necessary: because I find the will often confounded with several of the affections, especially desire; and one put for the

other, and that by men, who would not willingly be thought not to have had very distinct notions of things, and not to have writ very clearly about them. This, I imagine, has been no small occasion of obscurity and mistake in this matter; and therefore is, as much as may be, to be avoided. For he, that shall turn his thoughts inwards upon what passes in his mind, when he wills, shall see, that the will or power of volition is conversant about nothing, but that particular determination of the mind, whereby, barely by a thought, the mind endeavours to give rise, continuation, or stop to any action, which it takes to be in its power. This well considered, plainly shows, that the will is perfectly distinguished from desire; which in the very same action may have a quite contrary tendency from that which our wills sets us upon. A man, whom I cannot deny, may oblige me to use persuasions to another, which, at the same time I am speaking, I may wish may not prevail on him. In this case, 'tis plain the will and desire run counter. I will the action; that tends one way, whilst my desire tends another, and that the direct contrary. A man, who by a violent fit of the gout in his limbs, finds a dozing in his head, or a want of appetite in his stomach removed, desires to be eased too of the pain of his feet or hands, (for wherever there is pain there is a desire to be rid of it) though yet, whilst he apprehends, that the removal of the pain may translate the noxious humour to a more vital part, his will is never determined to any one action, that may serve to remove this pain. Whence 'tis evident, that desiring and willing are two distinct acts of the mind; and consequently that the will, which is but the power of volition, is much more distinct from desire.

§31. Uneasiness determines the will. To return then to the inquiry, 'what is it that determines the will in regard to our actions?' And that upon second thoughts I am apt to imagine is not, as is generally supposed, the greater good in view: but some (and for the most part the most pressing) uneasiness a man is at present under. This is that which successively determines the will, and sets us upon those actions, we perform. This uneasiness we may call, as 'tis, desire; which is an uneasiness of the mind for want of some absent good. All pain of the body, of what sort soever, and disquiet of the mind, is uneasiness: and with this is always joined desire, equal to the pain or uneasiness felt; and is scarce distinguishable from it. For desire being nothing but an uneasiness in the want of an absent good, in reference to any pain felt, ease is that absent good; and till that ease be attained, we may call it desire, nobody feeling pain, that he wishes not to be eased of,

with a desire equal to that pain, and inseparable from it. Besides this desire of ease from pain, there is another of absent positive good, and here also the desire and uneasiness is equal. As much as we desire any absent good, so much are we in pain for it. But here all absent good does not, according to the greatness it has, or is acknowledged to have, cause pain equal to that greatness; as all pain causes desire equal to itself: because the absence of good is not always a pain, as the presence of pain is. And therefore absent good may be looked on, and considered without desire. But so much as there is anywhere of desire, so much there is of uneasiness.

§32. Desire is uneasiness. That desire is a state of uneasiness, every one who reflects on himself, will quickly find. Who is there that has not felt in desire what the wise man says of hope, (which is not much different from it), that it being ‘deferred makes the heart sick’ and that still proportionable to the greatness of the desire, which sometimes raises the uneasiness to that pitch, that it makes people cry out, ‘Give me children.’ give me the thing desired, ‘or I die’ Life itself, and all its enjoyments, is a burden cannot be borne under the lasting and unremoved pressure of such an uneasiness.

§33. The uneasiness of desire determines the will. Good and evil, present and absent, ’tis true, work upon the mind: but that which immediately determines the will, from time to time, to every voluntary action, is the uneasiness of desire, fixed on some absent good: either negative, as indolence to one in pain; or positive, as enjoyment of pleasure. That ’tis this uneasiness that determines the will to the successive voluntary actions, whereof the greatest part of our lives is made up, and by which we are conducted through different courses to different ends, I shall endeavour to show both from experience, and the reason of the thing.

§34. This is the spring of action. When a man is perfectly content with the state he is in, which is when he is perfectly without any uneasiness, what industry, what action, what will is there left, but to continue in it? Of this every man’s observation will satisfy him. And thus we see our all-wise Maker, suitably to our constitution and frame, and knowing what ’tis that determines the will, has put into man the uneasiness of hunger and thirst, and other natural desires, that return at their seasons, to move and determine their wills, for the

preservation of themselves, and the continuation of their species. For I think we may conclude, that, if the bare contemplation of these good ends, to which we are carried by these several uneasinesses, had been sufficient to determine the will, and set us on work, we should have had none of these natural pains, and perhaps in this world, little or no pain at all. 'Tis better to marry than to burn,' says St. Paul; where we may see, what 'tis, that chiefly drives men into the enjoyments of a conjugal life. A little burning felt pushes us more powerfully, than greater pleasures in prospect draw or allure.

§35. The greatest positive good determines not the will, but uneasiness. It seems so established and settled a maxim by the general consent of all mankind, that good, the greater good, determines the will, that I do not at all wonder, that when I first published my thoughts on this subject, I took it for granted; and I imagine, that by a great many I shall be thought more excusable for having then done so, than that now I have ventured to recede from so received an opinion. But yet upon a stricter inquiry, I am forced to conclude that good, the greater good, though apprehended and acknowledged to be so, does not determine the will, until our desire, raised proportionably to it, makes us uneasy in the want of it. Convince a man never so much, that plenty has its advantages over poverty; make him see and own, that the handsome conveniences of life are better than nasty penury: yet as long as he is content with the latter, and finds no uneasiness in it, he moves not; his will never is determined to any action, that shall bring him out of it. Let a man be ever so well persuaded of the advantages of virtue, that 'tis as necessary to a man, who has any great aims in this world, or hopes in the next, as food to life: yet till he 'hungers or thirsts after righteousness'; till he feels an uneasiness in the want of it, his will will not be determined to any action in pursuit of this confessed greater good; but any other uneasiness he feels in himself, shall take place, and carry his will to other actions. On the other side, let a drunkard see, that his health decays, his estate wastes; discredit and diseases, and the want of all things, even of his beloved drink attends him in the course he follows: yet the returns of uneasiness to miss his companions, the habitual thirst after his cups at the usual time, drives him to the tavern, though he has in his view the loss of health and plenty, and perhaps of the joys of another life: the least of which is no inconsiderable good, but such as he confesses is far greater than the tickling of his palate with a glass of wine, or the idle chat of a soaking club. 'Tis not for want of viewing the greater

good; for he sees and acknowledges it, and in the intervals of his drinking hours, will take resolutions to pursue the greater good; but when the uneasiness to miss his accustomed delight returns, the great acknowledged good loses its hold, and the present uneasiness determines the will to the accustomed action; which thereby gets stronger footing to prevail against the next occasion, though he at the same time makes secret promises to himself, that he will do so no more; this is the last time he will act against the attainment of those greater goods. And thus he is, from time to time, in the state of that unhappy complainer, *'Video meliora proboque, deteriora sequor'*: which sentence, allowed for true, and made good by constant experience, may in this, and possibly no other way, be easily made intelligible.

§36. Because the removal of uneasiness is the first step to happiness.

If we inquire into the reason of what experience makes so evident in fact, and examine, why 'tis uneasiness alone operates on the will, and determines it in its choice, we shall find, that we being capable but of one determination of the will to one action at once, the present uneasiness, that we are under, does naturally determine the will, in order to that happiness which we all aim at in all our actions: for as much as whilst we are under any uneasiness, we cannot apprehend ourselves happy, or in the way to it. Pain and uneasiness being, by every one, concluded, and felt, to be inconsistent with happiness; spoiling the relish, even of those good things which we have: a little pain serving to mar all the pleasure we rejoiced in. And therefore that, which of course determines the choice of our will to the next action, will always be the removing of pain, as long as we have any left, as the first and necessary step towards happiness.

§37. Because uneasiness alone is present. Another reason why 'tis uneasiness alone determines the will, may be this: Because that alone is present, and 'tis against the nature of things, that what is absent should operate where 'tis not. It may be said that absent good may by contemplation be brought home to the mind, and made present. The idea of it indeed may be in the mind, and viewed as present there; but nothing will be in the mind as a present good, able to counterbalance the removal of any uneasiness, which we are under, till it raises our desire, and the uneasiness of that has the prevalency in determining

the will. Till then the idea in the mind of whatever is good, is there only like other ideas, the object of bare unactive speculation; but operates not on the will, nor sets us on work: the reason whereof I shall show by and by. How many are to be found, that have had lively representations set before their minds of the unspeakable joys of Heaven, which they acknowledge both possible and probable too, who yet would be content to take up with their happiness here' and so the prevailing uneasiness of their desires, let loose after the enjoyments of this life, take their turns in the determining their wills, and all that while they take not one step, are not one jot moved, towards the good things of another life, considered as never so great.

§38. Because all who allow the joys of Heaven possible, pursue them not. Were the will determined by the views of good, as it appears in contemplation greater or less to the understanding, which is the state of all absent good, and that which in the received opinion the will is supposed to move to, and to be moved by, I do not see how it could ever get loose from the infinite eternal joys of Heaven, once proposed and considered as possible. For all absent good, by which alone, barely proposed, and coming in view, the will is thought to be determined, and so to set us on action, being only possible, but not infallibly certain, 'tis unavoidable, that the infinitely greater possible good should regularly and constantly determine the will in all the successive actions it directs; and then we should keep constantly and steadily in our course towards Heaven, without ever standing still, or directing our actions to any other end: the eternal condition of a future state infinitely outweighing the expectation of riches, or honour, or any other worldly pleasure, which we can propose to ourselves, though we should grant these the more probable to be obtained: for nothing future is yet in possession, and so the expectation even of these may deceive us. If it were so, that the greater good in view determines the will, so great a good once proposed could not but seize the will, and hold it fast to the pursuit of this infinitely greatest good, without ever letting it go again: for the will having a power over, and directing the thoughts, as well as other actions, would, if it were so, hold the contemplation of the mind fixed to that good.

But any great uneasiness is never neglected. This would be the state of the mind, and regular tendency of the will in all its determinations, were it determined by that which is considered, and

in view the greater good; but that 'tis not so, is visible in experience. the infinitely greatest confessed good being often neglected, to satisfy the successive uneasiness of our desires pursuing trifles. But though the greatest allowed, even everlasting unspeakable good, which has sometimes moved, and affected the mind, does not stedfastly hold the will, yet we see any very great and prevailing uneasiness, having once laid hold on the will, let it not go; by which we may be convinced, what 'tis that determines the will. Thus any vehement pain of the body; the ungovernable passion of a man violently in love; or the impatient desire of revenge, keeps the will steady and intent; and the will thus determined, never lets the understanding lay by the object, but all the thoughts of the mind, and powers of the body are uninterruptedly employed that way, by the determination of the will, influenced by that topping uneasiness, as long as it lasts; whereby it seems to me evident, that the will, or power of setting us upon one action in preference to all others, is determined in us, by uneasiness: and whether this be not so, I desire everyone to observe in himself.

§39. Desire accompanies all uneasiness. I have hitherto chiefly instanced in the uneasiness of desire, as that which determines the will. Because that is the chief, and most sensible; and the will seldom orders any action, nor is there any voluntary action performed, without some desire accompanying it; which I think is the reason why the will and desire are so often confounded. But yet we are not to look upon the uneasiness which makes up, or at least accompanies most of the other passions, as wholly excluded in the case. Aversion, fear, anger, envy, shame, etc. have each their uneasinesses too, and thereby influence the will. These passions are scarce any of them in life and practice, simple, and alone, and wholly unmixed with others; though usually in discourse and contemplation, that carries the name, which operates strongest, and appears most in the present state of the mind. Nay, there is, I think, scarce any of the passions to be found without desire joined with it. I am sure, wherever there is uneasiness, there is desire: for we constantly desire happiness; and whatever we feel of uneasiness, so much 'tis certain, we want of happiness; even in our own opinion, let our state and condition otherwise be what it will. Besides, the present moment not being our eternity, whatever our enjoyment be, we look beyond the present, and desire goes with our foresight, and that still carries the will with it. So that even in joy itself, that which keeps up the action,

whereon the enjoyment depends, is the desire to continue it, and fear to lose it: and whenever a greater uneasiness than that takes place in the mind, the will presently is by that determined to some new action, and the present delight neglected.

§40. The most pressing uneasiness naturally determines the will. But we being in this world beset with sundry uneasinesses, distracted with different desires, the next inquiry naturally will be, which of them has the precedency in determining the will to the next action' and to that the answer is, that ordinarily, which is the most pressing of those that are judged capable of being then removed. For, the will being the power of directing our operative faculties to some action, for some end, cannot at any time be moved towards what is judged at that time unattainable: that would be to suppose an intelligent being designedly to act for an end, only to lose its labour; for so 'tis to act for what is judged not attainable; and therefore very great uneasinesses move not the will, when they are judged not capable of a cure: they, in that case, put us not upon endeavours. But these set apart, the most important and urgent uneasiness we at that time feel, is that which ordinarily determines the will successively, in that train of voluntary actions which makes up our lives. The greatest present uneasiness is the spur to action, that is constantly felt, and for the most part determines the will in its choice of the next action. For this we must carry along with us, that the proper and only object of the will is some action of ours, and nothing else. For we producing nothing by our willing it, but some action in our power, 'tis there the will terminates, and reaches no further.

§41. All desire happiness. If it be further asked, what 'tis moves desire' I answer, happiness, and that alone. Happiness and misery are the names of two extremes, the utmost bounds whereof we know not; 'tis what 'eye hath not seen, ear hath not heard, nor hath it entered into the heart of man to conceive.' But of some degrees of both we have very lively impressions; made by several instances of delight, and joy on the one side; and torment and sorrow on the other; which, for shortness' sake, I shall comprehend under the names of pleasure and pain, there being pleasure and pain of the mind, as well as the body, 'With him is fulness of joy, and pleasure for evermore': or, to speak truly, they are all of the mind; though some have their rise in the mind from thought, others in the body from certain modifications of motion.

§42. Happiness what. Happiness then in its full extent is the utmost pleasure we are capable of, and misery the utmost pain; and the lowest degree of what can be called happiness, is so much ease from all pain, and so much present pleasure, as without which anyone cannot be content. Now because pleasure and pain are produced in us by the operation of certain objects, either on our minds or our bodies; and in different degrees; therefore what has an aptness to produce pleasure in us, is that we call good, and what is apt to produce pain in us, we call evil, for no other reason, but for its aptness to produce pleasure and pain in us, wherein consists our happiness and misery. Further, though what is apt to produce any degree of pleasure, be in itself good; and what is apt to produce any degree of pain, be evil; yet it often happens, that we do not call it so when it comes in competition with a greater of its sort; because, when they come in competition, the degrees also of pleasure and pain have justly a preference. So that if we will rightly estimate what we call good and evil, we shall find it lies much in comparison: for the cause of every less degree of pain, as well as every greater degree of pleasure, has the nature of good, and vice versa.

§43. What good is desired, what not. Though this be that which is called good and evil; and all good be the proper object of desire in general; yet all good, even seen and confessed to be so, does not necessarily move every particular man's desire; but only that part, or so much of it, as is considered, and taken to make a necessary part of his happiness. All other good however great in reality, or appearance, excites not a man's desires, who looks not on it to make a part of that happiness, wherewith he, in his present thoughts, can satisfy himself. Happiness, under this view, every one constantly pursues, and desires what makes any part of it: other things, acknowledged to be good, he can look upon without desire; pass by, and be content without. There is nobody, I think, so senseless as to deny that there is pleasure in knowledge: and for the pleasures of sense, they have too many followers to let it be questioned, whether men are taken with them or no. Now let one man place his satisfaction in sensual pleasures, another in the delight of knowledge: though each of them cannot but confess, there is great pleasure in what the other pursues; yet neither of them making the other's delight a part of his happiness, their desires are not moved, but each is satisfied without what the other enjoys; and so his will is not determined to the pursuit of it. But yet as soon as the studious man's hunger and thirst make

him uneasy, he whose will was never determined to any pursuit of good cheer, poignant sauces, delicious wine, by the pleasant taste he has found in them, is, by the uneasiness of hunger and thirst presently determined to eating and drinking; though possibly with great indifferency what wholesome food comes in his way. And, on the other side, the epicure buckles to study, when shame, or the desire to recommend himself to his mistress, shall make him uneasy in the want of any sort of knowledge. Thus how much soever men are in earnest, and constant in pursuit of happiness; yet they may have a clear view of good, great and confessed good, without being concerned for it, or moved by it, if they think they can make up their happiness without it. Though as to pain, that they are always concerned for; they can feel no uneasiness without being moved. And therefore being uneasy in the want of whatever is judged necessary to their happiness, as soon as any good appears to make a part of their portion of happiness, they begin to desire it.

§44. Why the greatest good is not always desired. This, I think, any one may observe in himself, and others, that the greater visible good does not always raise men's desires in proportion to the greatness it appears, and is acknowledged to have: though every little trouble moves us, and sets us on work to get rid of it. The reason whereof is evident from the nature of our happiness and misery itself. All present pain, whatever it be, makes a part of our present misery: but all absent good does not at any time make a necessary part of our present happiness, nor the absence of it make a part of our misery. If it did, we should be constantly and infinitely miserable; there being infinite degrees of happiness, which are not in our possession. All uneasiness therefore being removed, a moderate portion of good serves at present to content men; and some few degrees of pleasure in a succession of ordinary enjoyments make up a happiness, wherein they can be satisfied. If this were not so, there could be no room for those indifferent, and visibly trifling actions, to which our wills are so often determined; and wherein we voluntarily waste so much of our lives; which remissness could by no means consist with a constant determination of will or desire to the greatest apparent good. That this is so, I think few people need go far from home to be convinced. And indeed in this life there are not many, whose happiness reaches so far, as to afford them a constant train of moderate mean pleasures, without any mixture of uneasiness; and yet they could be content to stay here for ever: though they cannot deny, but that 'tis possible

there may be a state of eternal durable joys after this life, far surpassing all the good is to be found here. Nay, they cannot but see, that 'tis more possible, than the attainment and continuation of that pittance of honour, riches, or pleasure, which they pursue; and for which they neglect that eternal state: but yet in full view of this difference, satisfied of the possibility of a perfect, secure, and lasting happiness in a future state, and under a clear conviction, that 'tis not to be had here whilst they bound their happiness within some little enjoyment, or aim of this life, and exclude the joys of Heaven from making any necessary part of it, their desires are not moved by this greater apparent good, nor their wills determined to any action, or endeavour for its attainment.

§45. Why not being desired, it moves not the will. The ordinary necessities of our lives, fill a great part of them with the uneasinesses of hunger, thirst, heat, cold, weariness with labour, and sleepiness in their constant returns, etc. To which, if besides accidental harms, we add the fantastical uneasiness, (as itch after honour, power, or riches, etc.) which acquired habits by fashion, example, and education, have settled in us, and a thousand other irregular desires, which custom has made natural to us, we shall find, that a very little part of our life is so vacant from these uneasinesses, as to leave us free to the attraction of remoter absent good. We are seldom at ease, and free enough from the solicitation of our natural or adopted desires, but a constant succession of uneasinesses out of that stock, which natural wants, or acquired habits have heaped up, take the will in their turns; and no sooner is one action dispatched, which by such a determination of the will we are set upon, but another uneasiness is ready to set us on work. For the removing of the pains we feel, and are at present pressed with, being the getting out of misery, and consequently the first thing to be done in order to happiness, absent good, though thought on, confessed, and appearing to be good, not making any part of this unhappiness in its absence, is justled out, to make way for the removal of those uneasinesses we feel till due, and repeated contemplation has brought it nearer to our mind, given some relish of it, and raised in us some desire; which then beginning to make a part of our present uneasiness, stands upon fair terms with the rest, to be satisfied, and so according to its greatness, and pressure comes in its turn to determine the will.

§46. Due consideration raises desire. And thus, by a due

consideration, and examining any good proposed, 'tis in our power, to raise our desires, in a due proportion to the value of that good, whereby in its turn, and place, it may come to work upon the will, and be pursued. For good, though appearing, and allowed never so great, yet till it has raised desires in our minds, and thereby made us uneasy in its want, it reaches not our wills; we are not within the sphere of its activity; our wills being under the determination only of those uneasinesses, which are present to us, which (whilst we have any) are always soliciting, and ready at hand to give the will its next determination. The balancing, when there is any in the mind, being only which desire shall be next satisfied, which uneasiness first removed. Whereby it comes to pass, that as long as any uneasiness, any desire remains in our mind, there is no room for good, barely as such, to come at the will, or at all to determine it. Because, as has been said, the first step in our endeavours after happiness being to get wholly out of the confines of misery, and to feel no part of it, the will can be at leisure for nothing else, till every uneasiness we feel be perfectly removed: which in the multitude of wants and desires, we are beset with in this imperfect state, we are not like to be ever freed from in this world.

§47. The power to suspend the prosecution of any desire, makes way for consideration. There being in us a great many uneasinesses always soliciting, and ready to determine the will, 'tis natural, as I have said, that the greatest and most pressing should determine the will to the next action; and so it does for the most part, but not always. For the mind having in most cases, as is evident in experience, a power to suspend the execution and satisfaction of any of its desires, and so all, one after another, is at liberty to consider the objects of them examine them on all sides, and weigh them with others. In this lies the liberty man has; and from the not using of it right comes all that variety of mistakes, errors, and faults which we run into, in the conduct of our lives, and our endeavours after happiness; whilst we precipitate the determination of our wills, and engage too soon before due examination. To prevent this, we have a power to suspend the prosecution of this or that desire, as every one daily may experiment in himself. This seems to me the source of all liberty; in this seems to consist that which is (as I think improperly) called free will. For during this suspension of any desire, before the will be determined to action, and the action (which follows that determination) done, we have opportunity to examine, view, and judge, of the good or evil of

what we are going to do; and when, upon due examination, we have judged, we have done our duty, all that we can, or ought to do, in pursuit of our happiness; and 'tis not a fault, but a perfection of our nature to desire, will, and act according to the last result of a fair examination.

§48. To be determined by our own judgment, is no restraint to liberty. This is so far from being a restraint or diminution of freedom, that 'tis the very improvement and benefit of it; 'tis not an abridgment, 'tis the end and use of our liberty; and the further we are removed from such a determination, the nearer we are to misery and slavery. A perfect indifferency in the mind, not determinable by its last judgment of the good or evil, that is thought to attend its choice, would be so far from being an advantage and excellency of any intellectual nature, that it would be as great an imperfection, as the want of indifferency. to act, or not to act, till determined by the will, would be an imperfection on the other side. A man is at liberty to lift up his hand to his head, or let it rest quiet: he is perfectly indifferent in either; and it would be an imperfection in him, if he wanted that power, if he were deprived of that indifferency. But it would be as great an imperfection, if he had the same indifferency, whether he would prefer the lifting up his hand, or its remaining in rest, when it would save his head or eyes from a blow he sees coming: 'tis as much a perfection, that desire, or the power of preferring, should be determined by good, as that the power of acting should be determined by the will, and the certainer such determination is, the greater is the perfection. Nay, were we determined by anything but the last result of our own minds, judging of the good or evil of any action, we were not free. The very end of our freedom being, that we might attain the good we choose. And therefore every man is put under a necessity by his constitution, as an intelligent being, to be determined in willing by his own thought and judgment, what is best for him to do: else he would be under the determination of some other than himself, which is want of liberty. And to deny, that a man's will, in every determination, follows his own judgment, is to say, that a man wills and acts for an end that he would not have at the time that he wills and acts for it. For if he prefers it in his present thoughts before any other, 'tis plain he then thinks better of it, and would have it before any other, unless he can have, and not have it; will and not will it at the same time; a contradiction too manifest to be admitted!

§49. The freest agents are so determined. If we look upon those superior beings above us, who enjoy perfect happiness, we shall have reason to judge, that they are more steadily determined in their choice of good than we; and yet we have no reason to think they are less happy, or less free, than we are. And if it were fit for such poor finite creatures as we are, to pronounce what infinite wisdom and goodness could do, I think, we might say, that God himself cannot choose what is not good; the freedom of the Almighty hinders not his being determined by what is best.

§50. A constant determination to a pursuit of happiness no abridgment of liberty. But to give a right view of this mistaken part of liberty, let me ask, would anyone be a changeling, because he is less determined, by wise considerations, than a wise man? Is it worth the name of freedom to be at liberty to play the fool, and draw shame and misery upon a man's self? If to break loose from the conduct of reason, and to want that restraint of examination and judgment which keeps us from choosing or doing the worse, be liberty, true liberty, mad men and fools are the only free men: But yet, I think, nobody would choose to be mad for the sake of such liberty, but he that is mad already. The constant desire of happiness, and the constraint it puts upon us to act for it, nobody, I think, accounts an abridgment of liberty, or at least an abridgment of liberty to be complained of. God Almighty himself is under the necessity of being happy; and the more any intelligent being is so, the nearer is its approach to infinite perfection and happiness. That in this state of ignorance we short-sighted creatures might not mistake true felicity, we are endowed with a power to suspend any particular desire, and keep it from determining the will, and engaging us in action. This is standing still, where we are not sufficiently assured of the way: examination, is consulting a guide. The determination of the will, upon inquiry, is following the direction of that guide: and he that has a power to act, or not to act according as such determination directs, is a free agent; such determination abridges not that power wherein liberty consists. He that has his chains knocked off, and the prison doors set open to him, is perfectly at liberty, because he may either go or stay, as he best likes; though his preference be determined to stay, by the darkness of the night, or illness of the weather, or want of other lodging. He ceases not to be free; though the desire of some convenience to be had there, absolutely determines his preference, and makes him stay in his prison.

§51. The necessity of pursuing true happiness the foundation of liberty. As therefore the highest perfection of intellectual nature lies in a careful and constant pursuit of true and solid happiness; so the care of ourselves, that we mistake not imaginary for real happiness, is the necessary foundation of our liberty. The stronger ties we have to an unalterable pursuit of happiness in general, which is our greatest good, and which, as such, our desires always follow, the more are we free from any necessary determination of our will to any particular action, and from a necessary compliance with our desire, set upon any particular, and then appearing preferable good, till we have duly examined, whether it has a tendency to, or be inconsistent with our real happiness: and therefore till we are as much informed upon this inquiry as the weight of the matter, and the nature of the case demands, we are by the necessity of preferring and pursuing true happiness as our greatest good, obliged to suspend the satisfaction of our desires in particular cases.

§52. The reason of it. This is the hinge on which turns the liberty of intellectual beings, in their constant endeavours after, and a steady prosecution of true felicity, that they can suspend this prosecution in particular cases, till they have looked before them, and informed themselves, whether that particular thing which is then proposed or desired, lie in the way to their main end, and make a real part of that which is their greatest good; for the inclination, and tendency of their nature to happiness, is an obligation and motive to them, to take care not to mistake, or miss it; and so necessarily puts them upon caution, deliberation, and wariness, in the direction of their particular actions, which are the means to obtain it. Whatever necessity determines to the pursuit of real bliss, the same necessity, with the same force establishes suspense, deliberation, and scrutiny of each successive desire, whether the satisfaction of it does not interfere with our true happiness, and mislead us from it. This, as seems to me, is the great privilege of finite intellectual beings; and I desire it may be well considered, whether the great inlet and exercise of all the liberty men have, are capable of, or can be useful to them, and that whereon depends the turn of their actions, does not lie in this, that they can suspend their desires, and stop them from determining their wills to any action, till they have duly and fairly examined the good and evil of it, as far forth as the weight of the thing requires. This we are able to do; and when we have done it, we have done our duty, and all that is in our power; and indeed all that needs. For, since the will supposes

knowledge to guide its choice, all that we can do, is to hold our wills undetermined, till we have examined the good and evil of what we desire. What follows after that, follows in a chain of consequences linked one to another, all depending on the last determination of the judgment, which whether it shall be upon a hasty and precipitate view, or upon a due and mature examination, is in our power; experience showing us, that in most cases we are able to suspend the present satisfaction of any desire.

§53. Government of our passions, the right improvement of liberty. But if any extreme disturbance (as sometimes it happens) possesses our whole mind, as when the pain of the rack, an impetuous uneasiness, as of love, anger, or any other violent passion, running away with us, allows us not the liberty of thought, and we are not masters enough of our own minds to consider thoroughly, and examine fairly; God, who knows our frailty, pities our weakness, and requires of us no more than we are able to do, and sees what was and what was not in our power; will judge as a kind and merciful father. But the forbearance of a too hasty compliance with our desires, the moderation and restraint of our passions, so that our understandings may be free to examine, and reason unbiased give its judgment, being that whereon a right direction of our conduct to true happiness depends; 'tis in this we should employ our chief care and endeavours. In this we should take pains to suit the relish of our minds to the true intrinsic good or ill that is in things, and not permit an allowed or supposed possible great and weighty good to slip out of our thoughts, without leaving any relish, any desire of itself there, till, by a due consideration of its true worth, we have formed appetites in our minds suitable to it, and made ourselves uneasy in the want of it, or in the fear of losing it. And how much this is in everyone's power, everyone by making resolutions to himself, such as he may keep, is easy for everyone to try. Nor let any one say, he cannot govern his passions, nor hinder them from breaking out, and carrying him into action; for what he can do before a prince, or a great man, he can do alone, or in the presence of God, if he will.

§54. How men come to pursue different courses. From what has been said, 'tis easy to give account, how it comes to pass, that though all men desire happiness, yet their wills carry them so contrarily, and consequently some of them to what is evil. And to this I say, that the various and contrary choices that men make in the world, do not

argue, that they do not all pursue good; but that the same thing is not good to every man alike. This variety of pursuits shows, that everyone does not place his happiness in the same thing, or choose the same way to it. Were all the concerns of man terminated in this life, why one followed study and knowledge, and another hawking and hunting; why one chose luxury and debauchery, and another sobriety and riches, would not be, because everyone of these did not aim at his own happiness; but because their happiness was placed in different things. And therefore 'twas a right answer of the physician to his patient that had sore eyes: if you have more pleasure in the taste of wine, than in the use of your sight, wine is good for you; but if the pleasure of seeing be greater to you than that of drinking, wine is naught.

§55. The mind has a different relish, as well as the palate; and you will as fruitlessly endeavour to delight all men with riches or glory, (which yet some men place their happiness in,) as you would to satisfy all men's hunger with cheese or lobsters; which though very agreeable and delicious fair to some, are to others extremely nauseous and offensive: and many people would with reason prefer the griping of an hungry belly to those dishes, which are a feast to others. Hence it was, I think, that the philosophers of old did in vain inquire, whether summum bonum consisted in riches, or bodily delights, or virtue or contemplation' And they might have as reasonably disputed, whether the best relish were to be found in apples, plums, or nuts, and have divided themselves into sects upon it. For as pleasant tastes depend not on the things themselves, but their agreeableness to this or that particular palate, wherein there is great variety; so the greatest happiness consists in the having those things which produce the greatest pleasure; and in the absence of those which cause any disturbance, any pain. Now, these to different men, are very different things. If therefore men in this life only have hope; if in this life they can only enjoy, 'tis not strange, nor unreasonable, that they should seek their happiness by avoiding all things that disease them here, and by pursuing all that delight them; wherein it will be no wonder to find variety and difference. For if there be no prospect beyond the grave, the inference is certainly right 'Let us eat and drink,' let us enjoy what we delight in, 'for tomorrow we shall die.' This, I think, may serve to show us the reason, why, though all men's desires tend to happiness, yet they are not moved by the same object. Men may choose different things, and yet all choose right, supposing them only like a company

of poor insects, whereof some are bees, delighted with flowers and their sweetness; others beetles, delighted with other kinds of viands; which having enjoyed for a season, they would cease to be, and exist no more for ever.

§56. How men come to choose ill. These things, duly weighed, will give us, as I think, a clear view into the state of human liberty.

Liberty, 'tis plain consists in a power to do, or not to do; to do, or forbear doing as we will. This cannot be denied. But this seeming to comprehend only the actions of a man consecutive to volition, 'tis further inquired, whether he be at liberty to will, or no' and to this it has been answered, that in most cases a man is not at liberty to forbear the act of volition; he must exert an act of his will, whereby the action proposed, is made to exist, or not to exist. But yet there is a case wherein a man is at liberty in respect of willing, and that is the choosing of a remote good as an end to be pursued. Here a man may suspend the act of his choice from being determined for or against the thing proposed, till he has examined, whether it be really of a nature in itself and consequences to make him happy or not. For when he has once chosen it, and thereby 'tis become a part of his happiness, it raises desire, and that proportionably gives him uneasiness, which determines his will, and sets him at work in pursuit of his choice on all occasions that offer. And here we may see how it comes to pass, that a man may justly incur punishment, though it be certain that in all the particular actions that he wills, he does, and necessarily does will that which he then judges to be good. For though his will be always determined by that which is judged good by his understanding, yet it excuses him not: because, by a too hasty choice of his own making, he has imposed on himself wrong measures of good and evil; which however false and fallacious, have the same influence on all his future conduct, as if they were true and right. He has vitiated his own palate, and must be answerable to himself for the sickness and death that follows from it. The eternal law and nature of things must not be altered to comply with his ill-ordered choice. If the neglect or abuse of the liberty he had, to examine what would really and truly make for his happiness, misleads him, the miscarriages that follow on it, must be imputed to his own election. He had a power to suspend his determination: It was given him, that he might examine, and take care of his own happiness, and look that he were not deceived. And he could never judge, that it was better to be deceived than not in a

matter of so great and near concernment.

What has been said, may also discover to us the reason why, men in this world prefer different things, and pursue happiness by contrary courses. But yet since men are always constant, and in earnest, in matters of happiness and misery, the question still remains, how men come often to prefer the worse to the better; and to choose that, which by their own confession, has made them miserable.

§57. To account for the various and contrary ways men take, though all aim at being happy, we must consider, whence the various uneasinesses, that determine the will in the preference of each voluntary action, have their rise.

1. From bodily pain. Some of them come from causes not in our power, such as are often the pains of the body from want, disease, or outward injuries, as the rack, etc. which when present, and violent, operate for the most part forcibly on the will, and turn the courses of men's lives from virtue, piety, and religion, and what, before they judged, to lead to happiness; every one not endeavouring, or through disuse, not being able by the contemplation of remote and future good, to raise in himself desires of them strong enough to counterbalance the uneasiness he feels in those bodily torments; and to keep his will steady in the choice of those actions which lead to future happiness. A neighbour country has been of late a tragical theatre, from which we might fetch instances, if there needed any, and the world did not in all countries and ages furnish examples enough to confirm that received observation, '*Necessitas cogit ad turpia*'; and therefore there is great reason for us to pray, 'Lead us not into temptation.'

2. From wrong desires arising from wrong judgment. Other uneasinesses arise from our desires of absent good; which desires always bear proportion to, and depend on the judgment we make, and the relish we have of any absent good; in both which we are apt to be variously misled, and that by our own fault.

§58. Our judgment of present good or evil always right. In the first place, I shall consider the wrong judgments men make of future good and evil, whereby their desires are misled. For as to present happiness and misery, when that alone comes into consideration, and the consequences are quite removed, a man never chooses amiss; he

knows what best pleases him, and that he actually prefers. Things in their present enjoyment are what they seem; the apparent and real good are, in this case, always the same. For the pain or pleasure being just so great, and no greater, than 'tis felt, the present good or evil is really so much as it appears. And therefore were every action of ours concluded within itself, and drew no consequences after it, we should undoubtedly never err in our choice of good; we should always infallibly prefer the best. Were the pains of honest industry, and of starving with hunger and cold set together before us, nobody would be in doubt which to choose: were the satisfaction of a lust, and the joys of Heaven offered at once to any one's present possession, he would not balance, or err in the determination of his choice.

§59. But since our voluntary actions carry not all the happiness and misery, that depend on them, along with them in their present performance, but are the precedent causes of good and evil, which they draw after them, and bring upon us, when they themselves are passed and cease to be; our desires look beyond our present enjoyments, and carry the mind out to absent good, according to the necessity which we think there is of it, to the making or increase of our happiness. 'Tis our opinion of such a necessity that gives it its attraction: without that, we are not moved by absent good. For in this narrow scantling of capacity which we are accustomed to and sensible of here, wherein we enjoy but one pleasure at once, which, when all uneasiness is away, is, whilst it lasts, sufficient to make us think ourselves happy, 'tis not all remote and even apparent good that affects us. Because the indolency and enjoyment we have, sufficing for our present happiness, we desire not to venture the change: since we judge that we are happy already, being content, and that is enough. For who is content is happy. But as soon as any new uneasiness comes in, this happiness is disturbed, and we are set afresh on work in the pursuit of happiness.

§60. From a wrong judgment of what makes a necessary part of their happiness. Their aptness therefore to conclude that they can be happy without it, is one great occasion that men often are not raised to the desire of the greatest absent good. For whilst such thoughts possess them, the joys of a future state move them not; they have little concern or uneasiness about them; and the will, free from the determination of such desires, is left to the pursuit of nearer satisfactions, and to the removal of those uneasinesses which it then

feels in its want of, and longings after them. Change but a man's view of these things; let him see, that virtue and religion are necessary to his happiness; let him look into the future state of bliss or misery, and see there God, the righteous judge, ready to 'render to every man according to his deeds; to them who by patient continuance in well-doing seek for glory, and honour, and immortality, eternal life; but unto every soul that doth evil, indignation and wrath, tribulation and anguish.' To him, I say, who hath a prospect of the different state of perfect happiness or misery that attends all men after this life, depending on their behaviour here, the measures of good and evil, that govern his choice, are mightily changed. For since nothing of pleasure and pain in this life, can bear any proportion to the endless happiness, or exquisite misery of an immortal soul hereafter, actions in his power will have their preference, not according to the transient pleasure or pain that accompanies, or follows them here; but as they serve to secure that perfect durable happiness hereafter.

§61. A more particular account of wrong judgment. But to account more particularly for the misery that men often bring on themselves, notwithstanding that they do all in earnest pursue happiness, we must consider, how things come to be represented to our desires under deceitful appearances: and that is by the judgment pronouncing wrongly concerning them. To see how far this reaches, and what are the causes of wrong judgment, we must remember, that things are judged good or bad in a double sense.

First, that which is properly good or bad, is nothing but barely pleasure or pain.

Secondly, but because not only present pleasure and pain, but that also which is apt by its efficacy or consequences, to bring it upon us at a distance, is a proper object of our desires, and apt to move a creature that has foresight; therefore things also that draw after them pleasure and pain, are considered as good and evil.

§62. The wrong judgment that misleads us, and makes the will often fasten on the worse side, lies in misreporting upon the various comparisons of these. The wrong judgment I am here speaking of, is not what one man may think of the determination of another; but what every man himself must confess to be wrong. For since I lay it for a certain ground, that every intelligent being really seeks happiness, which consists in the enjoyment of pleasure, without any considerable

mixture of uneasiness; 'tis impossible anyone should willingly put into his own draught any bitter ingredient, or leave out anything in his power, that would tend to his satisfaction, and the completing of his happiness, but only by wrong judgment. I shall not here speak of that mistake which is the consequence of invincible error, which scarce deserves the name of wrong judgment; but of that wrong judgment, which every man himself must confess to be so.

§63. I. In comparing present and future. Therefore, as to present pleasure and pain, the mind, as has been said, never mistakes that which is really good or evil; that which is the greater pleasure, or the greater pain, is really just as it appears. But though present pleasure and pain show their difference and degrees so plainly, as not to leave room to mistake; yet when we compare present pleasure or pain with future, (which is usually the case in the most important determinations of the will) we often make wrong judgments of them, taking our measures of them in different positions of distance. Objects, near our view, are apt to be thought greater, than those of a larger size, that are more remote: and so 'tis with pleasures and pains, the present is apt to carry it, and those at a distance have the disadvantage in the comparison. Thus most men, like spendthrift heirs, are apt to judge a little in hand better than a great deal to come; and so for small matters in possession, part with greater ones in reversion. But that this is a wrong judgment everyone must allow, let his pleasure consist in whatever it will: since that which is future, will certainly come to be present; and then, having the same advantage of nearness, will show itself in its full dimensions, and discover his wilful mistake, who judged of it by unequal measures. Were the pleasure of drinking accompanied, the very moment a man takes off his glass, with that sick stomach and aching head, which, in some men, are sure to follow not many hours after, I think nobody, whatever pleasure he had in his cups, would, on these conditions, ever let wine touch his lips; which yet he daily swallows, and the evil side comes to be chosen only by the fallacy of a little difference in time. But if pleasure or pain can be so lessened only by a few hours' removal, how much more will it be so, by a further distance, to a man, that will not by a right judgement do what time will, i.e. bring it home upon himself, and consider it as present, and there take its true dimensions' This is the way we usually impose on ourselves, in respect of bare pleasure and pain, or the true degrees of happiness or misery: the future loses its just proportion, and what is present, obtains the preference as the

greater. I mention not here the wrong judgment, whereby the absent are not only lessened, but reduced to perfect nothing; when men enjoy what they can in present, and make sure of that, concluding amiss, that no evil will thence follow. For that lies not in comparing the greatness of future good and evil, which is that we are here speaking of; but in another sort of wrong judgment, which is concerning good or evil, as 'tis considered to be the cause and procurement of pleasure or pain that will follow from it.

§64. Causes of this. The cause of our judging amiss, when we compare our present pleasure or pain with future, seems to me to be the weak and narrow constitution of our minds. We cannot well enjoy two pleasures at once, much less any pleasure almost, whilst pain possesses us. The present pleasure, if it be not very languid, and almost none at all, fills our narrow souls, and so takes up the whole mind, that it scarce leaves any thought of things absent: or if among our pleasures, there are some which are not strong enough to exclude the consideration of things at a distance; yet we have so great an abhorrence of pain, that a little of it extinguishes all our pleasures: A little bitter mingled in our cup, leaves no relish of the sweet. Hence it comes, that, at any rate, we desire to be rid of the present evil, which we are apt to think nothing absent can equal; because under the present pain we find not ourselves capable of any the least degree of happiness. Men's daily complaints, are a loud proof of this: the pain that any one actually feels, is still of all other the worst; and 'tis with anguish they cry out, 'any rather than this: nothing can be so intolerable as what I now suffer.' And therefore our whole endeavours and thoughts are intent to get rid of the present evil, before all things, as the first necessary condition to our happiness; let what will follow. Nothing, as we passionately think, can exceed, or almost equal, the uneasiness that sits so heavy upon us. And because the abstinence from a present pleasure that offers itself is a pain, nay, oftentimes a very great one, the desire being inflamed by a near and tempting object, 'tis no wonder that that operates after the same manner pain does, and lessens in our thoughts what is future; and so forces us, as it were, blindfold into its embraces.

§65. Add to this, that absent good, or, which is the same thing, future pleasure, especially if of a sort which we are unacquainted with, seldom is able to counter-balance any uneasiness, either of pain or desire, which is present. For its greatness being no

more than what shall be really tasted when enjoyed, men are apt enough to lessen that, to make it give place to any present desire; and conclude with themselves, that when it comes to trial, it may possibly not answer the report or opinion, that generally passes of it, they having often found, that not only what others have magnified, but even what they themselves have enjoyed with great pleasure and delight at one time, has proved insipid or nauseous at another; and therefore they see nothing in it, for which they should forego a present enjoyment. But that this is a false way of judging, when applied to the happiness of another life, they must confess, unless they will say, God cannot make those happy he designs to be so. For that being intended for a state of happiness, it must certainly be agreeable to everyone's wish and desire: could we suppose their relishes as different there, as they are here, yet the manna in Heaven will suit every one's palate. Thus much of the wrong judgment we make of present and future pleasure and pain, when they are compared together, and so the absent considered as future.

§66. II. In considering consequences of actions. As to things good or bad in their consequences, and by the aptness that is in them to procure us good or evil in the future, we judge amiss several ways.

1. When we judge that so much evil does not really depend on them, as in truth there does.

2. When we judge, that though the consequence be of that moment, yet 'tis not of that certainty, but that it may otherwise fall out; or else by some means be avoided, as by industry, address, change, repentance, etc. That these are wrong ways of judging, were easy to show, in every particular, if I would examine them at large singly: but I shall only mention this in general, viz. that 'tis a very wrong, and irrational way of proceeding, to venture a greater good, for a less, upon uncertain guesses, and before a due examination be made, proportionable to the weightiness of the matter, and the concernment 'tis to us not to mistake. This, I think, everyone must confess, especially if he considers the usual cause of this wrong judgment, whereof these following are some: §67. Causes of this. I. Ignorance: He that judges without informing himself to the utmost that he is capable, cannot acquit himself of judging amiss.

II. Inadvertency: When a man overlooks even that which he does know. This is an affected and present ignorance, which misleads our

judgments as much as the other. Judging is, as it were, balancing an account, and determining on which side the odds lie. If therefore either side be huddled up in haste, and several of the sums, that should have gone into the reckoning, be overlooked, and left out, this precipitancy causes as wrong a judgment, as if it were a perfect ignorance. That which most commonly causes this, is the prevalency of some present pleasure or pain, heightened by our feeble passionate nature, most strongly wrought on by what is present. To check this precipitancy, our understanding and reason were given us, if we will make a right use of it, to search, and see, and then judge thereupon. Without liberty, the understanding would be to no purpose: and without understanding, liberty (if it could be) would signify nothing. If a man sees what would do him good or harm, what would make him happy or miserable, without being able to move himself one step towards or from it, what is he the better for seeing? And he that is at liberty to ramble in perfect darkness, what is his liberty better, than if he were driven up and down as a bubble by the force of the wind? The being acted by a blind impulse from without, or from within, is little odds. The first, therefore, and great use of liberty, is to hinder blind precipitancy; the principal exercise of freedom, is to stand still, open the eyes, look about, and take a view of the consequence of what we are going to do, as much as the weight of the matter requires. How much sloth and negligence, heat and passion, the prevalency of fashion, or acquired indispositions, do severally contribute on occasion, to these wrong judgments, I shall not here further inquire. I shall only add one other false judgment, which I think necessary to mention, because perhaps 'tis little taken notice of, though of great influence.

§68. Wrong judgment of what is necessary to our happiness. All Men desire happiness, that is past doubt: but, as has been already observed, when they are rid of pain, they are apt to take up with any pleasure at hand, or that custom has endeared to them, to rest satisfied in that; and so being happy, till some new desire, by making them uneasy, disturbs that happiness, and shows them, that they are not so, they look no further, nor is the will determined to any action in pursuit of any other known or apparent good. For since we find, that we cannot enjoy all sorts of good, but one excludes another; we do not fix our desires on every apparent greater good, unless it be judged to be necessary to our happiness: if we think we can be happy without it, it moves us not. This is another occasion to men of judging

wrong, when they take not that to be necessary to their happiness, which really is so. This mistake misleads us both in the choice of the good we aim at, and very often in the means to it, when 'tis a remote good. But, which way ever it be, either by placing it where really 'tis not, or by neglecting the means, as not necessary to it, when a man misses his great end happiness, he will acknowledge he judged not right. That which contributes to this mistake, is the real or supposed unpleasantness of the actions, which are the way to this end; it seeming so preposterous a thing to men, to make themselves unhappy in order to happiness, that they do not easily bring themselves to it.

§69. We can change the agreeableness or disagreeableness in things. The last inquiry, therefore concerning this matter, is, whether it be in a man's power to change the pleasantness and unpleasantness, that accompanies any sort of action' and as to that, 'tis plain, in many cases he can. Men may and should correct their palates, and give relish to what either has, or they suppose has none. The relish of the mind, is as various as that of the body, and like that too may be altered; and 'tis a mistake to think, that men cannot change the displeasingness, or indifferency, that is in actions, into pleasure and desire, if they will do but what is in their power. A due consideration will do it in some cases; and practice, application, and custom in most. Bread or tobacco may be neglected, where they are shown to be useful to health, because of an indifferency or disrelish to them; reason and consideration at first recommends, and begins their trial, and use finds, or custom makes them pleasant. That this is so in virtue too, is very certain. Actions are pleasing or displeasing, either in themselves, or considered as a means to a greater and more desirable end. The eating of a well-seasoned dish, suited to a man's palate, may move the mind by the delight itself, that accompanies the eating, without reference to any other end; to which the consideration of the pleasure there is in health and strength, (to which that meat is subservient) may add a new gusto, able to make us swallow an illrelished potion. In the latter of these, any action is rendered more or less pleasing, only by the contemplation of the end, and the being more or less persuaded of its tendency to it, or necessary connexion with it: but the pleasure of the action itself is best acquired, or increased, by use and practice. Trials often reconcile us to that, which at a distance we looked on with aversion; and by repetitions wear us into a liking, of what possibly, in the first essay, displeased us. Habits have powerful charms, and put so strong attractions of easiness and

pleasure into what we accustom ourselves to, that we cannot forbear to do, or at least be easy in the omission of actions; which habitual practice has suited, and thereby recommends to us. Though this be very visible, and every one's experience shows him he can do so; yet 'tis a part, in the conduct of men towards their happiness, neglected to a degree, that it will be possibly entertained as a paradox, if it be said, that men can make things or actions more or less pleasing to themselves; and thereby remedy that, to which one may justly impute a great deal of their wandering. Fashion and the common opinion having settled wrong notions, and education and custom ill habits, the just values of things are misplaced, and the palates of men corrupted. Pains should be taken to rectify these; and contrary habits change our pleasures, and give a relish to that which is necessary, or conducive to our happiness. This every one must confess he can do, and when happiness is lost, and misery overtakes him, he will confess, he did amiss in neglecting it, and condemn himself for it: and I ask every one, whether he has not often done so'

§70. Preference of vice to virtue a manifest wrong judgment. I shall not now enlarge any further on the wrong judgments and neglect of what is in their power, whereby men mislead themselves. This would make a volume, and is not my business. But whatever false notions, or shameful neglect of what is in their power, may put men out of their way to happiness, and distract them, as we see, into so different courses of life, this yet is certain, that morality, established upon its true foundations, cannot but determine the choice in anyone, that will but consider: and he that will not be so far a rational creature as to reflect seriously upon infinite happiness and misery, must needs condemn himself, as not making that use of his understanding he should. The rewards and punishments of another life, which the Almighty has established, as the enforcements of his law, are of weight enough to determine the choice, against whatever pleasure or pain this life can show, when the eternal state is considered but in its bare possibility, which nobody can make any doubt of. He that will allow exquisite and endless happiness to be but the possible consequence of a good life here, and the contrary state, the possible reward of a bad one, must own himself to judge very much amiss, if he does not conclude, That a virtuous life, with the certain expectation of everlasting bliss, which may come, is to be preferred to a vicious one, with the fear of that dreadful state of misery, which 'tis very possible may overtake the guilty; or at best the terrible uncertain hope

of annihilation. This is evidently so, though the virtuous life here had nothing but pain, and the vicious continual pleasure: which yet is, for the most part, quite otherwise, and wicked men have not much the odds to brag of, even in their present possession; nay, all things rightly considered, have, I think, even the worse part here. But when infinite happiness is put into one scale, against infinite misery in the other; if the worst that comes to the pious man, if he mistakes, be the best that the wicked can attain to, if he be in the right, who can without madness run the venture? Who in his wits would choose to come within a possibility of infinite misery, which if he miss, there is yet nothing to be got by that hazard? Whereas on the other side, the sober man ventures nothing against infinite happiness to be got, if his expectation comes not to pass. If the good man be in the right, he is eternally happy; if he mistakes, he's not miserable, he feels nothing. On the other side, if the wicked be in the right, he is not happy; if he mistakes, he is infinitely miserable. Must it not be a most manifest wrong judgment, that does not presently see, to which side, in this case, the preference is to be given? I have forborne to mention anything of the certainty, or probability of a future state, designing here to show the wrong judgment, that anyone must allow he makes upon his own principles, laid how he pleases, who prefers the short pleasures of a vicious life upon any consideration, whilst he knows, and cannot but be certain, that a future life is at least possible.

§71. Recapitulation To conclude this inquiry into human liberty, which, as it stood before, I myself from the beginning fearing, and a very judicious friend of mine, since the publication, suspecting to have some mistake in it, though he could not particularly show it me, I was put upon a stricter review of this chapter. Wherein lighting upon a very easy and scarce observable slip I had made, in putting one seemingly indifferent word for another that discovery opened to me this present view, which here, in this second edition, I submit to the learned world, and which in short is this: liberty is a power to act or not to act, according as the mind directs. A power to direct the operative faculties to motion or rest in particular instances is that which we call the will. That which in the train of our voluntary actions determines the will to any change of operation, is some present uneasiness, which is, or at least is always accompanied with that of desire. Desire is always moved by evil, to fly it; because a total freedom from pain, always makes any necessary part of our happiness: but every good, nay, every greater good does not constantly move

desire, because it may not make, or may not be taken to make any necessary part of our happiness. For all that we desire, is only to be happy. But, though this general desire of happiness operates constantly and invariably, yet the satisfaction of any particular desire can be suspended from determining the will to any subservient action, till we have maturely examined, whether the particular apparent good, which we then desire, makes a part of our real happiness, or be consistent or inconsistent with it. The result of our judgment upon that examination, is what ultimately determines the man, who could not be free, if his will were determined by anything but his own desire guided by his own judgment. I know that liberty by some, is placed in an indifferency of the man, antecedent to the determination of his will. I wish they, who lay so much stress on such an antecedent indifferency, as they call it, had told us plainly, whether this supposed indifferency be antecedent to the thought and judgment of the understanding, as well as to the decree of the will. For 'tis pretty hard to state it between them, i.e. immediately after the judgment of the understanding, and before the determination of the will, because the determination of the will immediately follows the judgment of the understanding; and to place liberty in an indifferency, antecedent to the thought and judgment of the understanding, seems to me to place liberty in a state of darkness, wherein we can neither see nor say anything of it; at least it places it in a subject incapable of it, no agent being allowed capable of liberty, but in consequence of thought and judgment. I am not nice about phrases, and therefore consent to say with those that love to speak so, that liberty is placed in indifferency; but 'tis an indifferency That remains after the judgment of the understanding, yea, even after the determination of the will: and that is an indifferency not of the man (for after he has once judged which is best, viz. to do, or forbear, he is no longer indifferent) but an indifferency of the operative powers of the man, which remaining equally able to operate, or to forbear operating after, as before the decree of the will, are in a state, which, if one pleases, may be called indifferency; and as far as this indifferency reaches, a man is free, and no further: v.g. I have the ability to move my hand, or to let it rest, that operative power is indifferent to move, or not to move my hand. I am then in that respect perfectly free; my will determines that operative power to rest, I am yet free, because the indifferency of that my operative power to act, or not to act, still remains; the power of moving my hand, is not at all impaired by the determination of my will, which at present orders rest; the indifferency of that power to

act, or not to act, is just as it was before, as will appear, if the will puts it to the trial, by ordering the contrary. But if, during the rest of my hand, it be seized with a sudden palsy, the indifferency of that operative power is gone, and with it my liberty, I have no longer freedom in that respect, but am under a necessity of letting my hand rest. On the other side, if my hand be put into motion by a convulsion, the indifferency of that operative faculty is taken away by that motion, and my liberty in that case is lost: for I am under a necessity of having my hand move. I have added this, to show in what sort of indifferency liberty seems to me to consist, and not in any other, real or imaginary.

§72. True notions concerning the nature and extent of liberty are of so great importance, that I hope I shall be pardoned this digression, which my attempt to explain it has led me into. The ideas of will, volition, liberty, and necessity, in this Chapter of Power, came naturally in my way. In a former edition of this treatise I gave an account of my thoughts concerning them, according to the light I then had: and now, as a lover of truth, and not a worshipper of my own doctrines, I own some change of my opinion, which I think I have discovered ground for. In what I first writ, I with an unbiased indifferency followed truth, whither I thought she led me. But neither being so vain as to fancy infallibility, nor so disingenuous as to dissemble my mistakes, for fear of blemishing my reputation, I have with the same sincere design for truth only, not been ashamed to publish what a severer inquiry has suggested. 'Tis not impossible, but that some may think my former notions right, and some (as I have already found) these latter; and some neither. I shall not at all wonder at this variety in men's opinions: impartial deductions of reason in controverted points being so very rare, and exact ones in abstract notions not so very easy, especially if of any length. And therefore, I should think myself not a little beholden to any one, who would upon these, or any other grounds, fairly clear this subject of liberty from any difficulties that may yet remain.

Before I close this chapter, it may perhaps be to our purpose, and help to give us clearer conceptions about power, if we make our thoughts take a little more exact survey of action. I have said above, that we have ideas but of two sorts of action, viz. motion and thinking. These, in truth, though called and counted actions, yet, if nearly considered, will not be found to be always perfectly so. For, if I

mistake not, there are instances of both kinds, which, upon due consideration, will be found rather passions than actions; and consequently so far the effects barely of passive powers in those subjects, which yet on their accounts are thought agents. For in these instances, the substance that hath motion or thought receives the impression, whereby 'tis put into that action purely from without, and so acts merely by the capacity it has to receive such an impression from some external agent; and such a power is not properly an active power, but a mere passive capacity in the subject. Sometimes the substance, or agent, puts itself into action by its own power, and this is properly active power. Whatsoever modification a substance has, whereby it produces any effect, that is called action; v.g. a solid substance by motion operates on, or alters the sensible ideas of another substance, and therefore this modification of motion, we call action. But yet this motion in that solid substance is, when rightly considered, but a passion, if it received it only from some external agent. So that the active power of motion, is in no substance which cannot begin motion in itself, or in another substance, when at rest. So likewise in thinking, a power to receive ideas, or thoughts, from the operation of any external substance, is called a power of thinking; but this is but a passive power, or capacity. But to be able to bring into view ideas out of sight, at one's own choice, and to compare which of them one thinks fit, this is an active power. This reflection may be of some use to preserve us from mistakes about powers and actions, which grammar, and the common frame of languages, may be apt to lead us into: since what is signified by verbs that grammarians call active, does not always signify action: v.g. this proposition, I see the Moon, or a star, or I feel the heat of the sun, though expressed by a verb active, does not signify any action in me, whereby I operate on those substances; but the reception of the ideas of light, roundness, and heat, wherein I am not active, but barely passive, and cannot in that position of my eyes, or body, avoid receiving them. But when I turn my eyes another way, or remove my body out of the Sun-beams, I am properly active; because of my own choice, by a power within myself, I put myself into that motion. Such an action, is the product of active power.

§73. And thus I have, in a short draught, given a view of our original ideas, from whence all the rest are derived, and of which they are made up; which, if I would consider, as a philosopher, and examine on what causes they depend, and of what they are made, I

believe they all might be reduced to these very few primary and original ones, viz.

extension,

solidity,

mobility, or the power of being moved;

which by our senses we receive from body:perceptivity, or the power of perception, or thinking;motivity, or the power of moving;which by reflection we receive from our minds. I crave leave to make use of these two new words, to avoid the danger of being mistaken in the use of those which are equivocal. To which if we add

existence,

duration,

number;

which belong both to the one and the other, we have, perhaps, all the original ideas on which the rest depend. For by these, I imagine,might be explained the nature of colours, sounds, tastes, smells,and all other ideas we have, if we had but faculties acute enough to perceive the severally modified extensions, and motions of these minute bodies, which produce those several sensations in us. But my present purpose being only to inquire into the knowledge the mind has of things, by those ideas and appearances, which God has fitted it to receive from them, and how the mind comes by that knowledge, rather than into their causes, or manner of production,I shall not, contrary to the design of this essay, set myself to inquire philosophically into the peculiar constitution of bodies, and the configuration of parts, whereby they have the power to produce in us the ideas of their sensible qualities: I shall not enter any further into that disquisition; it sufficing to my purpose to observe, that gold or saffron, has a power to produce in us the idea of yellow; and snow or milk, the idea of white; which we can only have by our sight, without examining the texture of the parts of those bodies,or the particular figures, or motion of the particles, which rebound from them, to cause in us that particular sensation: though when we go beyond the bare ideas in our minds, and would inquire into their causes, we cannot conceive anything else to be in any sensible object, whereby it

produces different ideas in us, but the different bulk, figure, number, texture, and motion of its insensible parts.

Chapter XXII Of Mixed Modes

§1. Mixed modes what. Having treated of simple modes in the foregoing chapters, and given several instances of some of the most considerable of them, to show what they are, and how we come by them; we are now in the next place to consider those we call mixed modes; such are the complex ideas we mark by the names obligation, drunkenness, a lie, etc.; which consisting of several combinations of simple ideas of different kinds, I have called mixed modes, to distinguish them from the more simple modes, which consist only of simple ideas of the same kind. These mixed modes, being also such combinations of simple ideas as are not looked upon to be characteristical marks of any real beings that have a steady existence, but scattered and independent ideas put together by the mind, are thereby distinguished from the complex ideas of substances.

§2. Made by the mind. That the mind, in respect of its simple ideas, is wholly passive, and receives them all from the existence and operations of things, such as sensation or reflection offers them, without being able to make any one idea, experience shows us. But if we attentively consider these ideas I call mixed modes, we are now speaking of, we shall find their original quite different. The mind often exercises an active power in making these several combinations. for, it being once furnished with simple ideas, it can put them together in several compositions, and so make variety of complex ideas, without examining whether they exist so together in nature. And hence I think 'tis that these ideas are called notions: as if they had their original, and constant existence, more in the thoughts of men, than in the reality of things; and to form such ideas, it sufficed that the mind put the parts of them together, and that they were consistent in the understanding, without considering whether they had any real being: though I do not deny but several of them might be taken from observation, and the existence of several simple ideas so combined, as they are put together in the understanding. For the man who first framed the idea of hypocrisy, might have either taken it at first from the observation of one who made show of good qualities which he had not; or else have framed that idea in his mind without having any such pattern to fashion it by. For 'tis evident that, in the beginning of languages and societies of men, several of those complex ideas, which were consequent to the constitutions established amongst

them, must needs have been in the minds of men, before they existed anywhere else; and that many names that stood for such complex ideas were in use, and so those ideas framed, before the combinations they stood for ever existed.

§3. Sometimes got by the explication of their names. Indeed, now that languages are made, and abound with words standing for such combinations, an usual way of getting these complex ideas is, by the explication of those terms that stand for them. For, consisting of a company of simple ideas combined, they may, by words standing for those simple ideas, be represented to the mind of one who understands those words, though that complex combination of simple ideas were never offered to his mind by the real existence of things. Thus a man may come to have the idea of sacrilege or murder, by enumerating to him the simple ideas which these words stand for; without ever seeing either of them committed.

§4. The name ties the parts of mixed modes into one idea. Every mixed mode consisting of many distinct simple ideas, it seems reasonable to inquire, whence it has its unity; and how such a precise multitude comes to make but one idea; since that combination does not always exist together in nature. To which I answer, 'tis plain it has its unity from an act of the mind, combining those several simple ideas together, and considering them as one complex one, consisting of those parts; and the mark of this union, or that which is looked on generally to complete it, is one name given to that combination. For 'tis by their names that men commonly regulate their account of their distinct species of mixed modes, seldom allowing or considering any number of simple ideas to make one complex one, but such collections as there be names for. Thus, though the killing of an old man be as fit in nature to be united into one complex idea, as the killing a man's father; yet, there being no name standing precisely for the one, as there is the name of parricide to mark the other, 'tis not taken for a particular complex idea, nor a distinct species of actions from that of killing a young man, or any other man.

§5. The cause of making mixed modes. If we should inquire a little further, to see what 'tis that occasions men to make several combinations of simple ideas into distinct, and, as it were, settled modes, and neglect others, which in the nature of things themselves, have as much an aptness to be combined and make distinct ideas, we

shall find the reason of it to be the end of language; which being to mark, or communicate men's thoughts to one another with all the dispatch that may be, they usually make such collections of ideas into complex modes, and affix names to them, as they have frequent use of in their way of living and conversation, leaving others, which they have but seldom an occasion to mention, loose and without names that tie them together: they rather choosing to enumerate (when they have need) such ideas as make them up, by the particular names that stand for them, than to trouble their memories by multiplying of complex ideas with names to them, which they shall seldom or never have any occasion to make use of.

§6. Why words in one language have none answering in another. This shows us how it comes to pass that there are in every language many particular words which cannot be rendered by any one single word of another. For the several fashions, customs, and manners of one nation, making several combinations of ideas familiar and necessary in one, which another people have had never an occasion to make, or perhaps so much as take notice of, names come of course to be annexed to them, to avoid long periphrases in things of daily conversation; and so they become so many distinct complex ideas in their minds. Thus ο'στρακισμός *strhakismós* amongst the Greeks, and *proscriptio* amongst the Romans, were words which other languages had no names that exactly answered; because they stood for complex ideas which were not in the minds of the men of other nations. Where there was no such custom, there was no notion of any such actions; no use of such combinations of ideas as were united, and, as it were, tied together, by those terms: and therefore in other countries there were no names for them.

§7. And languages change. Hence also we may see the reason, why languages constantly change, take up new and lay by old terms. Because change of customs and opinions bringing with it new combinations of ideas, which 'tis necessary frequently to think on, and talk about, new names, to avoid long descriptions, are annexed to them; and so they become new species of complex modes. What a number of different ideas are by this means wrapped up in one short sound, and how much of our time and breath is thereby saved, any one will see, who will but take the pains to enumerate all the ideas that either, relieve, or, appeal, stand for; and instead of either of those names, use a periphrasis, to make anyone understand their

meaning.

§8. Mixed modes, where they exist. Though I shall have occasion to consider this more at large when I come to treat of Words and their use, yet I could not avoid to take this much notice here of the names of mixed modes; which being fleeting and transient combinations of simple ideas, which have but a short existence anywhere but in the minds of men, and there too have no longer any existence than whilst they are thought on, have not so much anywhere the appearance of a constant and lasting existence as in their names: which are therefore, in this sort of ideas, very apt to be taken for the ideas themselves. For, if we should inquire where the idea of a triumph or apotheosis exists, 'tis evident they could neither of them exist altogether anywhere in the things themselves, being actions that required time to their performance, and so could never all exist together; and as to the minds of men, where the ideas of these actions are supposed to be lodged, they have there too a very uncertain existence: and therefore we are apt to annex them to the names that excite them in us.

§9. How we get the ideas of mixed modes. There are therefore three ways whereby we get these complex ideas of mixed modes: 1. By experience and observation of things themselves: thus, by seeing two men wrestle or fence, we get the idea of wrestling or fencing. 2. By invention, or voluntary putting together of several simple ideas in our own minds: so he that first invented printing or etching, had an idea of it in his mind before it ever existed. 3. Which is the most usual way, by explaining the names of actions we never saw, or motions we cannot see; and by enumerating, and thereby, as it were, setting before our imaginations all those ideas which go to the making them up, and are the constituent parts of them. For, having by sensation and reflection stored our minds with simple ideas, and by use got the names that stand for them, we can by those names represent to another any complex idea we would have him conceive; so that it has in it no simple ideas but what he knows, and has with us the same name for. For all our complex ideas are ultimately resolvable into simple ideas, of which they are compounded and originally made up, though perhaps their immediate ingredients, as I may so say, are also complex ideas. Thus, the mixed mode which the word lie stands for is made of these simple ideas: 1. Articulate sounds. 2. Certain ideas in the mind of the speaker. 3. Those words the signs of those ideas. 4. Those signs put together, by affirmation or negation, otherwise than the

ideas they stand for are in the mind of the speaker. I think I need not go any further in the analysis of that complex idea we call a lie: what I have said is enough to show that 'tis made up of simple ideas. And it could not but be an offensive tediousness to my reader, to trouble him with a more minute enumeration of every particular simple idea that goes to this complex one; which, from what has been said, he cannot but be able to make out to himself. The same may be done in all our complex ideas whatsoever; which, however compounded and decomposed, may at last be resolved into simple ideas, which are all the materials of knowledge or thought we have, or can have. Nor shall we have reason to fear that the mind is hereby stinted to too scanty a number of ideas, if we consider what an inexhaustible stock of simple modes number and figure alone afford us. How far then mixed modes, which admit of the various combinations of different simple ideas, and their infinite modes, are from being few and scanty, we may easily imagine. So that, before we have done, we shall see that nobody need be afraid he shall not have scope and compass enough for his thoughts to range in, though they be, as I pretend, confined only to simple ideas, received from sensation or reflection, and their several combinations.

§10. Motion, thinking, and power have been most modified. 'Tis worth our observing, which of all our simple ideas have been most modified, and had most mixed ideas made out of them, with names given to them. and those have been these three: thinking and motion (which are the two ideas which comprehend in them all action,) and power, from whence these actions are conceived to flow. These simple ideas, I say, of thinking, motion, and power, have been those which have been most modified; and out of whose modifications have been made most complex modes, with names to them. For action being the great business of mankind, and the whole matter about which all laws are conversant, 'tis no wonder that the several modes of thinking and motion should be taken notice of, the ideas of them observed, and laid up in the memory, and have names assigned to them; without which laws could be but ill-made, or vice and disorders repressed. Nor could any communication be well had amongst men without such complex ideas, with names to them: and therefore men have settled names, and supposed settled ideas in their minds, of modes of actions, distinguished by their causes, means, objects, ends, instruments, time, place, and other circumstances; and also of their powers fitted for those actions: v.g. boldness is the power to speak or do what we

intend, before others, without fear or disorder; and the Greeks call the confidence of speaking by a peculiar name, παρ'ῆσις: which power or ability in man of doing anything, when it has been acquired by frequent doing the same thing, is that idea we name habit; when 'tis forward, and ready upon every occasion to break into action, we call it disposition. thus, testiness is a disposition or aptness to be angry.

To conclude: Let us examine any modes of action, v.g. consideration and assent, which are actions of the mind; running and speaking, which are actions of the body; revenge and murder, which are actions of both together, and we shall find them but so many collections of simple ideas, which, together, make up the complex ones signified by those names.

§11. Several words seeming to signify action, signify but the effect. Power being the source from whence all action proceeds, the substances wherein these powers are, when they exert this power into act, are called causes, and the substances which thereupon are produced, or the simple ideas which are introduced into any subject by the exerting of that power, are called effects. The efficacy whereby the new substance or idea is produced is called, in the subject exerting that power, action; but in the subject wherein any simple idea is changed or produced, 'tis called passion: which efficacy, however various, and the effects almost infinite, yet we can, I think, conceive it, in intellectual agents, to be nothing else but modes of thinking and willing; in corporeal agents, nothing else but modifications of motion. I say, I think we cannot conceive it to be any other but these two. For whatever sort of action besides these produce any effects, I confess myself to have no notion nor idea of; and so 'tis quite remote from my thoughts, apprehensions, and knowledge; and as much in the dark to me as five other senses, or as the ideas of colours to a blind man. And therefore many words which seem to express some action, signify nothing of the action or *modus operandi* at all, but barely the effect, with some circumstances of the subject wrought on, or cause operating: v.g. creation, annihilation, contain in them no idea of the action or manner whereby they are produced, but barely of the cause, and the thing done. And when a countryman says the cold freezes water, though the word freezing seems to import some action, yet truly it signifies nothing but the effect, viz. that water that was before fluid is become hard and consistent, without containing any idea of the action whereby 'tis done.

§12. Mixed modes made also of other ideas . I think I shall not need to remark here that, though power and action make the greatest part of mixed modes, marked by names, and familiar in the minds and mouths of men, yet other simple ideas, and their several combinations, are not excluded: much less, I think, will it be necessary for me to enumerate all the mixed modes which have been settled, with names to them. That would be to make a dictionary of the greatest part of the words made use of in divinity, ethics, law, and politics, and several other sciences. All that is requisite to my present design, is to show what sort of ideas those are which I call mixed modes; how the mind comes by them; and that they are compositions made up of simple ideas got from sensation and reflection; which I suppose I have done.

Chapter XXIII Of our Complex Ideas of Substances

§1. Ideas of substances, how made. The mind being, as I have declared, furnished with a great number of the simple ideas, conveyed in by the senses as they are found in exterior things, or by reflection on its own operations, takes notice also that a certain number of these simple ideas go constantly together; which being presumed to belong to one thing, and words being suited to common apprehensions, and made use of for quick dispatch, are called, so united in one subject, by one name; which, by inadvertency, we are apt afterward to talk of and consider as one simple idea, which indeed is a complication of many ideas together: because, as I have said, not imagining how these simple ideas can subsist by themselves, we accustom ourselves to suppose some substratum wherein they do subsist, and from which they do result, which therefore we call substance.

§2. Our idea of substance in general. So that if any one will examine himself concerning his notion of pure substance in general, he will find he has no other idea of it at all, but only a supposition of he knows not what support of such qualities which are capable of producing simple ideas in us; which qualities are commonly called accidents. If any one should be asked, what is the subject wherein colour or weight inheres, he would have nothing to say, but the solid extended parts; and if he were demanded, what is it that solidity and extension adhere in, he would not be in a much better case than the Indian before-mentioned, who, saying that the world was supported by a great elephant, was asked what the elephant rested on, to which

his answer was a great tortoise: but being again pressed to know what gave support to the broad-backed tortoise, replied-something, he knew not what. And thus here, as in all other cases where we use words without having clear and distinct ideas, we talk like children: who, being questioned what such a thing is, which they know not, readily give this satisfactory answer, that 'tis something: which in truth signifies no more, when so used, either by children or men, but that they know not what; and that the thing they pretend to know, and talk of, is what they have no distinct idea of at all, and so are perfectly ignorant of it, and in the dark. The idea then we have, to which we give the general name substance, being nothing but the supposed, but unknown, support of those qualities we find existing, which we imagine cannot subsist sine re substante, without something to support them, we call that support substantia; which, according to the true import of the word, is, in plain English, standing under or upholding.

§3. Of the sorts of substances. An obscure and relative idea of substance in general being thus made we come to have the ideas of particular sorts of substances, by collecting such combinations of simple ideas as are, by experience and observation of men's senses, taken notice of to exist together; and are therefore supposed to flow from the particular internal constitution, or unknown essence of that substance. Thus we come to have the ideas of a man, horse, gold, water, etc. of which substances, whether anyone has any other clear idea, further than of certain simple ideas coexistent together, I appeal to everyone's own experience. 'Tis the ordinary qualities observable in iron, or a diamond, put together, that make the true complex idea of those substances, which a smith or a jeweller commonly knows better than a philosopher; who, whatever substantial forms he may talk of, has no other idea of those substances, than what is framed by a collection of those simple ideas which are to be found in them: only we must take notice, that our complex ideas of substances, besides all those simple ideas they are made up of, have always the confused idea of something to which they belong, and in which they subsist: and therefore when we speak of any sort of substance, we say 'tis a thing having such or such qualities; as body is a thing that is extended, figured, and capable of motion; spirit, a thing capable of thinking; and so hardness, friability, and power to draw iron, we say, are qualities to be found in a loadstone. These, and the like fashions of speaking, intimate that the substance is supposed always something besides the

extension, figure, solidity, motion, thinking, or other observable ideas, though we know not what 'tis.

§4. No clear idea of substance in general. Hence, when we talk or think of any particular sort of corporeal substances, as horse, stone, etc. though the idea we have of either of them be but the complication or collection of those several simple ideas of sensible qualities, which we used to find united in the thing called horse or stone; yet, because we cannot conceive how they should subsist alone, nor one in another, we suppose them existing in and supported by some common subject; which support we denote by the name substance, though it be certain we have no clear or distinct idea of that thing we suppose a support.

§5. As clear an idea of spirit, as body. The same happens concerning the operations of the mind, viz. thinking, reasoning, fearing, etc. which we concluding not to subsist of themselves, nor apprehending how they can belong to body, or be produced by it, we are apt to think these the actions of some other substance, which we call spirit; whereby yet 'tis evident that, having no other idea or notion of matter, but something wherein those many sensible qualities which affect our senses do subsist; by supposing a substance wherein thinking, knowing, doubting, and a power of moving, etc. do subsist, we have as clear a notion of the substance of spirit, as we have of body; the one being supposed to be (without knowing what 'tis) the substratum to those simple ideas we have from without; and the other supposed (with a like ignorance of what 'tis) to be the substratum to those operations we experiment in ourselves within. 'Tis plain then, that the idea of corporeal substance in matter is as remote from our conceptions and apprehensions, as that of spiritual substance, or spirit: and therefore, from our not having any notion of the substance of spirit, we can no more conclude its non-existence, than we can, for the same reason, deny the existence of body; it being as rational to affirm there is no body, because we have no clear and distinct idea of the substance of matter, as to say there is no spirit, because we have no clear and distinct idea of the substance of a spirit.

§6. Of the sorts of substances. Whatever therefore be the secret and abstract nature of substance in general, all the ideas we have of particular distinct sorts of substances are nothing but several combinations of simple ideas, co-existing in such, though

unknown, cause of their union, as makes the whole subsist of itself. 'Tis by such combinations of simple ideas, and nothing else, that we represent particular sorts of substances to ourselves; such are the ideas we have of their several species in our minds; and such only do we, by their specific names, signify to others, v.g. man, horse, sun, water, iron: upon hearing which words, everyone, who understands the language, frames in his mind a combination of those several simple ideas which he has usually observed, or fancied to exist together under that denomination; all which he supposes to rest in and be, as it were, adherent to that unknown common subject, which inheres not in anything else. Though, in the meantime, it be manifest, and every one, upon inquiry into his own thoughts, will find, that he has no other idea of any substance, v.g. let it be gold, horse, iron, man, vitriol, bread, but what he has barely of those sensible qualities, which he supposes to inhere; with a supposition of such a substratum as gives, as it were, a support to those qualities or simple ideas, which he has observed to exist united together. Thus the idea of the Sun, what is it, but an aggregate of those several simple ideas, bright, hot, roundish, having a constant regular motion, at a certain distance from us, and perhaps some other: as he who thinks and discourses of the Sun, has been more or less accurate in observing those sensible qualities, ideas, or properties, which are in that thing which he calls the Sun.

§7. Powers a great part of our complex ideas of substances. For he has the perfectest idea of any of the particular sorts of substances, who has gathered, and put together, most of those simple ideas, which do exist in it; among which are to be reckoned its active powers, and passive capacities, which, though not simple ideas, yet, in this respect, for brevity's sake, may conveniently enough be reckoned amongst them. Thus the power of drawing iron, is one of the ideas of the complex one of that substance we call a loadstone, and a power to be so drawn is a part of the complex one we call iron: which powers pass for inherent qualities in those subjects. Because every substance being as apt, by the powers we observe in it, to change some sensible qualities in other subjects, as 'tis to produce in us those simple ideas which we receive immediately from it, does, by those new sensible qualities introduced into other subjects, discover to us those powers which do thereby mediately affect our senses, as regularly as its sensible qualities do it immediately, v.g. we immediately by our senses perceive in fire its heat and colour; which are, if rightly considered, nothing but powers in it to produce those ideas in us: we

also by our senses perceive the colour and brittleness of charcoal, whereby we come by the knowledge of another power in fire, which it has to change the colour and consistency of wood. By the former, fire immediately, by the latter, it mediately discovers to us these several powers; which therefore we look upon to be a part of the qualities of fire, and so make them a part of the complex idea of it. For all those powers that we take cognizance of, terminating only in the alteration of some sensible qualities, in those subjects on which they operate, and so making them exhibit to us new sensible ideas; therefore 'tis that I have reckoned these powers amongst the simple ideas which make the complex ones of the sort of substances; though these powers considered in themselves, are truly complex ideas. And in this looser sense I crave leave to be understood, when I name any of these potentialities among the simple ideas which we recollect in our minds when we think of particular substances. For the powers that are severally in them are necessary to be considered, if we will have true distinct notions of the several sorts of substances.

§8. And why. Nor are we to wonder that powers make a great part of our complex ideas of substances; since their secondary qualities are those which in most of them serve principally to distinguish substances one from another, and commonly make a considerable part of the complex idea of the several sorts of them. For, our senses failing us in the discovery of the bulk, texture, and figure of the minute parts of bodies, on which their real constitutions and differences depend, we are fain to make use of their secondary qualities as the characteristical notes and marks whereby to frame ideas of them in our minds, and distinguish them one from another.

All which secondary qualities, as has been shown, are nothing but bare powers. For the colour and taste of opium are, as well as its soporific or anodyne virtues, mere powers, depending on its primary qualities, whereby 'tis fitted to produce different operations on different parts of our bodies.

§9. Three sorts of ideas make our complex ones of substances. The ideas that make our complex ones of corporeal substances, are of these three sorts. First, the ideas of the primary qualities of things, which are discovered by our senses, and are in them even when we perceive them not, such are the bulk, figure, number, situation, and motion of the parts of bodies; which are really in them, whether we take notice

of them or not. Secondly, the sensible secondary qualities, which, depending on these, are nothing but the powers those substances have to produce several ideas in us by our senses; which ideas are not in the things themselves, otherwise than as anything is in its cause. Thirdly, the aptness we consider in any substance, to give or receive such alterations of primary qualities, as that the substance so altered should produce in us different ideas from what it did before; these are called active and passive powers: all which powers, as far as we have any notice or notion of them, terminate only in sensible simple ideas. For whatever alteration a loadstone has the power to make in the minute particles of iron, we should have no notion of any power it had at all to operate on iron, did not its sensible motion discover it; and I doubt not, but there are a thousand changes, that bodies we daily handle have a power to cause in one another, which we never suspect, because they never appear in sensible effects.

§10. Powers make a great part of our complex ideas of substances. Powers therefore justly make a great part of our complex ideas of substances. He that will examine his complex idea of gold, will find several of its ideas that make it up to be only powers; as the power of being melted, but of not spending itself in the fire; of being dissolved in aqua regia, are ideas as necessary to make up our complex idea of gold, as its colour and weight: which, if duly considered, are also nothing but different powers. For, to speak truly, yellowness is not actually in gold, but is a power in gold to produce that idea in us by our eyes, when placed in a due light: and the heat, which we cannot leave out of our ideas of the sun, is no more really in the sun, than the white colour it introduces into wax. These are both equally powers in the sun, operating, by the motion and figure of its sensible parts, so on a man, as to make him have the idea of heat; and so on wax, as to make it capable to produce in a man the idea of white.

§11. The now secondary qualities of bodies would disappear, if we could discover the primary ones of their minute parts. Had we senses acute enough to discern the minute particles of bodies, and the real constitution on which their sensible qualities depend, I doubt not but they would produce quite different ideas in us: and that which is now the yellow colour of gold, would then disappear, and instead of it we should see an admirable texture of parts, of a certain size and figure. This microscopes plainly discover to us; for what to our naked

eyes produces a certain colour, is, by thus augmenting the acuteness of our senses, discovered to be quite a different thing; and the thus altering, as it were, the proportion of the bulk of the minute parts of a coloured object to our usual sight, produces different ideas from what it did before. Thus, sand or pounded glass, which is opaque, and white to the naked eye, is pellucid in a microscope; and a hair seen in this way, loses its former colour, and is, in a great measure pellucid, with a mixture of some bright sparkling colours, such as appear from the refraction of diamonds, and other pellucid bodies. Blood, to the naked eye, appears all red; but by a good microscope, wherein its lesser parts appear, shows only some few globules of red, swimming in a pellucid liquor, and how these red globules would appear, if glasses could be found that could yet magnify them a thousand or ten thousand times more, is uncertain.

§12. Our faculties of discovery suited to our state. The infinite wise Contriver of us, and all things about us, hath fitted our senses, faculties, and organs, to the conveniences of life, and the business we have to do here. We are able, by our senses, to know and distinguish things: and to examine them so far as to apply them to our uses, and several ways to accommodate the exigences of this life. We have insight enough into their admirable contrivances, and wonderful effects, to admire and magnify the wisdom, power, and goodness of their Author. Such a knowledge as this, which is suited to our present condition, we want not faculties to attain. But it appears not that God intended we should have a perfect, clear, and adequate knowledge of them: that perhaps is not in the comprehension of any finite being. We are furnished with faculties (dull and weak as they are) to discover enough in the creatures, to lead us to the knowledge of the Creator, and the knowledge of our duty; and we are fitted well enough with abilities to provide for the conveniences of living: these are our business in this world. But were our senses altered, and made much quicker and acuter, the appearance and outward scheme of things would have quite another face to us; and I am apt to think, would be inconsistent with our being, or at least well-being, in this part of the universe which we inhabit. He that considers how little our constitution is able to bear a remove into parts of this air, not much higher than that we commonly breath in, will have reason to be satisfied, that in this globe of Earth allotted for our mansion, the all-wise Architect has suited our organs, and the bodies that are to affect them, one to another. If our sense of hearing were but a thousand

times quicker than 'tis, how would a perpetual noise distract us. And we should in the quietest retirement be less able to sleep or meditate than in the middle of a sea-fight.

Nay, if that most instructive of our senses, seeing, were in any man a thousand or a hundred thousand times more acute than 'tis now by the best microscope, things several millions of times less than the smallest object of his sight now would then be visible to his naked eyes, and so he would come nearer the discovery of the texture and motion of the minute parts of corporeal things; and in many of them, probably get ideas of their internal constitutions: but then he would be in a quite different world from other people: nothing would appear the same to him and others: the visible ideas of everything would be different. So that I doubt, whether he and the rest of men could discourse concerning the objects of sight, or have any communication about colours, their appearances being so wholly different. And perhaps such a quickness and tenderness of sight could not endure bright sunshine, or so much as open daylight; nor take in but a very small part of any object at once, and that too only at a very near distance. And if by the help of such microscopical eyes, (if I may so call them,) a man could penetrate further than ordinary into the secret composition and radical texture of bodies, he would not make any great advantage by the change, if such an acute sight would not serve to conduct him to the market and exchange; if he could not see things he was to avoid, at a convenient distance; nor distinguish things he had to do with by those sensible qualities others do. He that was sharpsighted enough to see the configuration of the minute particles of the spring of a clock, and observe upon what peculiar structure and impulse its elastic motion depends, would no doubt discover something very admirable: but if eyes so framed, could not view at once the hand, and the characters of the hour-plate, and thereby at a distance see what a clock it was, their owner could not be much benefited by that acuteness; which, whilst it discovered the secret contrivance of the parts of the machine, made him lose its use.

§13. Conjecture about spirits. And here give me leave to propose an extravagant conjecture of mine, viz. That since we have some reason (if there be any credit to be given to the report of things, that our philosophy cannot account for,) to imagine, that spirits can assume to themselves bodies of different bulk, figure, and conformation of parts Whether one great advantage some of them

have over us, may not lie in this, that they can so frame, and shape to themselves organs of sensation or perception, as to suit them to their present design, and the circumstances of the object they would consider. For how much would that man exceed all others in knowledge, who had but the faculty so to alter the structure of his eyes, that one sense, as to make it capable of all the several degrees of vision which the assistance of glasses (casually at first lighted on) has taught us to conceive? What wonders would he discover, who could so fit his eyes to all sorts of objects, as to see when he pleased the figure and motion of the minute particles in the blood, and other juices of animals, as distinctly as he does, at other times, the shape and motion of the animals themselves. But to us, in our present state, unalterable organs, so contrived as to discover the figure and motion of the minute parts of bodies, whereon depend those sensible qualities we now observe in them, would perhaps, be of no advantage. God has no doubt, made us so, as is best for us in our present condition. He hath fitted us for the neighbourhood of the bodies that surround us, and we have to do with; and though we cannot, by the faculties we have, attain to a perfect knowledge of things; yet they will serve us well enough for those ends abovementioned, which are our great concernment. I beg my reader's pardon for laying before him so wild a fancy, concerning the ways of perception of beings above us: but how extravagant soever it be, I doubt whether we can imagine anything about the knowledge of angels, but after this manner, some way or other, in proportion to what we find and observe in ourselves. And though we cannot but allow, that the infinite power and wisdom of God, may frame creatures with a thousand other faculties and ways of perceiving things without them, than what we have, yet our thoughts can go no further than our own, so impossible 'tis for us to enlarge our very guesses beyond the ideas received from our own sensation and reflection. The supposition at least, that angels do sometimes assume bodies, needs not startle us; since some of the most ancient and most learned Fathers of the church seemed to believe that they had bodies: and this is certain, that their state and way of existence is unknown to us.

§14. Complex ideas of substances. But to return to the matter in hand, the ideas we have of substances, and the ways we come by them; I say our specific ideas of substances are nothing else but a collection of a certain number of simple ideas, considered as united in one thing. These ideas of substances, though they are commonly

called simple apprehensions, and the names of them simple terms, yet in effect are complex and compounded. Thus the idea which an Englishman signifies by the name swan, is white colour, long neck, red beak, black legs, and whole feet, and all these of a certain size, with a power of swimming in the water, and making a certain kind of noise, and perhaps, to a man who has long observed this kind of birds, some other properties: which all terminate in sensible simple ideas, all united in one common subject.

§15. Ideas of spiritual substances, as clear as of bodily substances. Besides the complex ideas we have of material sensible substances, of which I have last spoken, by the simple ideas we have taken from those operations of our own minds, which we experiment daily in ourselves, as thinking, understanding, willing, knowing, and power of beginning motion, etc., co-existing in some substance, we are able to frame the complex idea of an immaterial spirit. And thus, by putting together the ideas of thinking, perceiving, liberty, and power of moving themselves and other things, we have as clear a perception and notion of immaterial substances, as we have of material. For putting together the ideas of thinking and willing, or the power of moving or quieting corporeal motion, joined to substance, of which we have no distinct idea, we have the idea of an immaterial spirit; and by putting together the ideas of coherent solid parts, and a power of being moved, joined with substance, of which likewise we have no positive idea, we have the idea of matter. The one is as clear and distinct an idea as the other: the idea of thinking, and moving a body, being as clear and distinct ideas, as the ideas of extension, solidity, and being moved. For our idea of substance, is equally obscure, or none at all, in both; 'tis but a supposed I know not what, to support those ideas we call accidents. 'Tis for want of reflection, that we are apt to think that our senses show us nothing but material things. Every act of sensation, when duly considered, gives us an equal view of both parts of nature, the corporeal and spiritual. For whilst I know, by seeing or hearing, etc. that there is some corporeal being without me, the object of that sensation, I do more certainly know, that there is some spiritual being within me that sees and hears. This I must be convinced, cannot be the action of bare insensible matter; nor ever could be without an immaterial thinking being.

§16. No idea of abstract substance. By the complex idea of extended, figured, coloured, and all other sensible qualities, which is

all that we know of it, we are as far from the idea of the substance of body, as if we knew nothing at all: nor after all the acquaintance and familiarity which we imagine we have with matter, and the many qualities men assure themselves they perceive and know in bodies, will it perhaps upon examination be found, that they have any more or clearer primary ideas belonging to body, than they have belonging to immaterial spirit.

§17. The cohesion of solid parts, and impulse, the primary ideas of body. The primary ideas we have peculiar to body, as contradistinguished to spirit, are the cohesion of solid, and consequently separable, parts, and a power of communicating motion by impulse. These, I think, are the original ideas proper and peculiar to body; for figure is but the consequence of finite extension.

§18. Thinking and motivity the primary ideas of spirit. The ideas we have belonging and peculiar to spirit, are thinking, and will, or a power of putting body into motion by thought, and, which is consequent to it, liberty. For as body cannot but communicate its motion by impulse to another body, which it meets with at rest, so the mind can put bodies into motion, or forbear to do so, as it pleases. The ideas of existence, duration, and mobility, are common to them both.

§19. Spirits capable of motion. There is no reason why it should be thought strange, that I make mobility belong to spirit; for having no other idea of motion, but change of distance, with other beings that are considered as at rest; and finding that spirits, as well as bodies, cannot operate but where they are; and that spirits do operate at several times in several places, I cannot but attribute change of place to all finite spirits: (for of the infinite spirit, I speak not here.) For ACnha Epters XaXyII IConcerning Of our Complex Ideas of Substances my soul, being a real being as well as my body, is certainly as capable of changing distance with any other body, or being, as body itself; and so is capable of motion. And if a mathematician can consider a certain distance, or a change of that distance between two points, one may certainly conceive a distance, and a change of distance between two spirits; and so conceive their motion, their approach or removal, one from another.

§20. Everyone finds in himself, that his soul can think, will, and operate on his body, in the place where that is, but cannot operate on a body, or in a place, an hundred miles distant from it. Nobody can

imagine that his soul can think or move a body at Oxford, whilst he is at London; and cannot but know, that, being united to his body, it constantly changes place all the whole journey, between Oxford and London, as the coach or horse does, that carries him, and I think may be said to be truly all that while in motion: or if that will not be allowed to afford us a clear idea enough of its motion, its being separated from the body in death, I think, will: for to consider it as going out of the body, or leaving it, and yet to have no idea of its motion, seems to me impossible.

§21. If it be said by any one that it cannot change place, because it hath none, for the spirits are not in loco, but ubi; I suppose that way of talking will not now be of much weight to many, in an age that is not much disposed to admire, or suffer themselves to be deceived by such unintelligible ways of speaking. But if any one thinks there is any sense in that distinction, and that 'tis applicable to our present purpose, I desire him to put it into intelligible English; and then from thence draw a reason to show that immaterial spirits are not capable of motion. Indeed motion cannot be attributed to God; not because he is an immaterial, but because he is an infinite spirit.

§22. Idea of soul and body compared. Let us compare then our complex idea of an immaterial spirit, with our complex idea of body, and see whether there be any more obscurity in one, than in the other, and in which most. Our idea of body, as I think, is an extended solid substance, capable of communicating motion by impulse: and our idea of soul, as an immaterial spirit, is of a substance that thinks, and has a power of exciting motion in body, by will, or thought. These, I think, are our complex ideas of soul and body, as contra-distinguished; and now let us examine which has most obscurity in it, and difficulty to be apprehended. I know, that people, whose thoughts are immersed in matter, and have so subjected their minds to their senses that they seldom reflect on anything beyond them, are apt to say, they cannot comprehend a thinking thing, which, perhaps, is true: but I affirm, when they consider it well, they can no more comprehend an extended thing.

§23. Cohesion of solid parts in body as hard to be conceived as thinking in a soul. If any one says, he knows not what 'tis thinks in him; he means he knows not what the substance is of that thinking thing: No more, say I, knows he what the substance is of that solid

thing. Further, if he says, he knows not how he thinks; I answer, neither knows he how he is extended; how the solid parts of body are united, or cohere together to make extension. For though the pressure of the particles of air may account for the cohesion of several parts of matter, that are grosser than the particles of air, and have pores less than the corpuscles of air, yet the weight or pressure of the air will not explain, nor can be a cause of the coherence of the particles of air themselves. And if the pressure of the aether, or any subtiler matter than the air, may unite, and hold fast together the parts of a particle of air, as well as other bodies; yet it cannot make bonds for itself, and hold together the parts that make up every the least corpuscle of that *materia subtilis*. So that that hypothesis, how ingeniously soever explained, by showing that the parts of sensible bodies are held together by the pressure of other external insensible bodies, reaches not the parts of the aether itself; and by how much the more evident it proves, that the parts of other bodies are held together by the external pressure of the aether, and can have no other conceivable cause of their cohesion and union, by so much the more it leaves us in the dark concerning the cohesion of the parts of the corpuscles of the aether itself: which we can neither conceive without parts, they being bodies, and divisible; nor yet how their parts cohere, they wanting that cause of cohesion, which is given of the cohesion of the parts of all other bodies.

§24. But, in truth, the pressure of any ambient fluid, how great soever, can be no intelligible cause of the cohesion of the solid parts of matter. For though such a pressure may hinder the avulsion of two polished superficies, one from another, in a line perpendicular to them, as in the experiment of two polished marbles; yet it can never, in the least hinder the separation by a motion, in a line parallel to those surfaces. Because the ambient fluid, having a full liberty to succeed in each point of space, deserted by a lateral motion, resists such a motion of bodies, so joined, no more than it would resist the motion of that body were it on all sides environed by that fluid, and touched no other body; and therefore, if there were no other cause of cohesion, all parts of bodies must be easily separable by such a lateral sliding motion. For if the pressure of the aether be the adequate cause of cohesion, wherever that cause operates not, there can be no cohesion. And since it cannot operate against such a lateral separation, (as has been shown), therefore in every imaginary plane, intersecting any mass of matter, there could be no more cohesion than of two polished

surfaces, which will always, notwithstanding any imaginable pressure of a fluid, easily slide one from another. So that perhaps, how clear an idea soever we think we have of the extension of body, which is nothing but the cohesion of solid parts, he that shall well consider it in his mind, may have reason to conclude, that 'tis as easy for him to have a clear idea how the soul thinks as how body is extended. For since body is no further, nor otherwise, extended, than by the union and cohesion of its solid parts, we shall very ill comprehend the extension of body, without understanding wherein consists the union and cohesion of its parts; which seems to me as incomprehensible, as the manner of thinking, and how 'tis performed.

§25. I allow 'tis usual for most people to wonder, how anyone should find a difficulty in what they think they every day observe. Do we not see, will they be ready to say, the parts of bodies stick firmly together? Is there anything more common? And what doubt can there be made of it? And the like, I say, concerning thinking, and voluntary motion: do we not every moment experiment it in ourselves; and therefore can it be doubted? The matter of fact is clear, I confess; but when we would a little nearer look into it, and consider how 'tis done, there, I think, we are at a loss, both in the one, and the other; and can as little understand how the parts of body cohere, as how we ourselves perceive or move. I would have anyone intelligibly explain to me, how the parts of gold, or brass, (that but now in fusion were as loose from one another, as the particles of water, or the sands of an hour-glass), come in a few moments to be so united, and adhere so strongly one to another, that the utmost force of men's arms cannot separate them: a considering man will, I suppose, be here at a loss to satisfy his own, or another man's understanding.

§26. The little bodies that compose that fluid we call water, are so extremely small, that I have never heard of anyone, who, by a microscope, (and yet I have heard of some that have magnified to ten thousand; nay, to much above a hundred thousand times,) pretended to perceive their distinct bulk, figure, or motion: and the particles of water are also so perfectly loose one from another, that the least force sensibly separates them. Nay, if we consider their perpetual motion, we must allow them to have no cohesion one with another; and yet let but a sharp cold come, and they unite, they consolidate; these little atoms cohere, and are not, without great force, separable. He that could find the bonds that tie these heaps of loose little bodies together

so firmly; he that could make known the cement that makes them stick so fast one to another, would discover a great, and yet unknown secret: and yet when that was done, would he be far enough from making the extension of body (which is the cohesion of its solid parts) intelligible, till he could show wherein consisted the union, or consolidation of the parts of those bonds, or of that cement, or of the least particle of matter that exists. Whereby it appears that this primary and supposed obvious quality of body will be found, when examined, to be as incomprehensible, as anything belonging to our minds, and a solid extended substance, as hard to be conceived as a thinking immaterial one, whatever difficulties some would raise against it.

§27. For, to extend our thoughts a little further, that pressure which is brought to explain the cohesion of bodies is as unintelligible as the cohesion itself. For if matter be considered, as no doubt 'tis, finite, let any one send his contemplation to the extremities of the universe, and there see what conceivable hoops, what bond he can imagine to hold this mass of matter in so close a pressure together, from whence steel has its firmness, and the parts of a diamond their hardness and indissolubility. If matter be finite, it must have its extremes; and there must be something to hinder it from scattering asunder. If, to avoid this difficulty, any one will throw himself into the supposition and abyss of infinite matter, let him consider what light he thereby brings to the cohesion of body, and whether he be ever the nearer making it intelligible, by resolving it into a supposition the most absurd and most incomprehensible of all other: so far is our extension of body (which is nothing but the cohesion of solid parts) from being clearer, or more distinct, when we would inquire into the nature, cause, or manner of it, than the idea of thinking.

§28. Communication of motion by impulse, or by thought, equally intelligible. Another idea we have of body is, the power of communication of motion by impulse; and of our souls, the power of exciting motion by thought. These ideas, the one of body, the other of our minds, every day's experience clearly furnishes us with: but if here again we inquire how this is done, we are equally in the dark. For in the communication of motion by impulse, wherein as much motion is lost to one body as is got to the other, which is the ordinarist case, we can have no other conception, but of the passing of motion out of

one body into another; which, I think, is as obscure and inconceivable as how our minds move or stop our bodies by thought, which we every moment find they do. The increase of motion by impulse, which is observed or believed sometimes to happen, is yet harder to be understood. We have by daily experience, clear evidence of motion produced both by impulse, and by thought; but the manner how, hardly comes within our comprehension: we are equally at a loss in both. So that however we consider motion, and its communication, either from body or spirit, the idea which belongs to spirit 'tis at least as clear as that which belongs to body. And if we consider the active power of moving, or, as I may call it, motivity, 'tis much clearer in spirit, than body, since two bodies, placed by one another at rest, will never afford us the idea of a power in the one to move the other, but by a borrowed motion: whereas the mind, every day affords us ideas of an active power of moving of bodies; and therefore 'tis worth our consideration, whether active power be not the proper attribute of spirits, and passive power of matter. Hence may be conjectured that created spirits are not totally separate from matter, because they are both active and passive. Pure spirit, viz. God, is only active; pure matter is only passive; those beings that are both active and passive, we may judge to partake of both. But be that as it will, I think, we have as many and as clear ideas belonging to spirit as we have belonging to body, the substance of each being equally unknown to us; and the idea of thinking in spirit, as clear as of extension in body; and the communication of motion by thought, which we attribute to spirit, is as evident as that by impulse, which we ascribe to body. Constant experience makes us sensible of both of these, though our narrow understandings can comprehend neither. For, when the mind would look beyond those original ideas we have from sensation or reflection, and penetrate into their causes, and manner of production, we find still it discovers nothing but its own short-sightedness.

§29. To conclude, sensation convinces us, that there are solid extended substances; and reflection, that there are thinking ones: experience assures us of the existence of such beings, and that the one hath a power to move body by impulse, the other by thought; this we cannot doubt of. Experience, I say, every moment furnishes us with the clear ideas both of the one and the other. But beyond these ideas, as received from their proper sources, our faculties will not reach. If we would inquire further into their nature, causes, and manner, we perceive not the nature of extension clearer

than we do of thinking. If we would explain them any further, one is as easy as the other; and there is no more difficulty to conceive how a substance we know not should, by thought, set body into motion, than how a substance we know not, should by impulse set body into motion. So that we are no more able to discover wherein the ideas belonging to body consist, than those belonging to spirit. From whence it seems probable to me, that the simple ideas we receive from sensation and reflection are the boundaries of our thoughts; beyond which the mind, whatever efforts it would make, is not able to advance one jot; nor can it make any discoveries, when it would pry into the nature and hidden causes of those ideas.

§30. Idea of body and spirit compared. So that, in short, the idea we have of spirit, compared with the idea we have of body, stands thus: the substance of spirits is unknown to us; and so is the substance of body equally unknown to us: two primary qualities, or properties of body, viz. solid coherent parts and impulse, we have distinct clear ideas of: so likewise we know, and have distinct clear ideas of two primary qualities or properties of spirit, viz. thinking, and a power of action; i.e. a power of beginning or stopping several thoughts or motions. We have also the ideas of several qualities, inherent in bodies, and have the clear distinct ideas of them; which qualities are but the various modifications of the extension of cohering solid parts, and their motion. We have likewise the ideas of the several modes of thinking viz. believing, doubting, intending, fearing, hoping; all which are but the several modes of thinking. We have also the ideas of willing, and moving the body consequent to it, and with the body itself too; for, as has been shown, spirit's capable of motion.

§31. The notion of spirit involves no more difficulty in it than that of body. Lastly, if this notion of immaterial spirit may have, perhaps, some difficulties in it not easily to be explained, we have therefore no more reason to deny, or doubt the existence of such spirits, than we have to deny or doubt the existence of body; because the notion of body is cumbered with some difficulties very hard, and perhaps, impossible to be explained or understood by us. For I would fain have instanced anything in our notion of spirit more perplexed, or nearer a contradiction, than the very notion of body includes in it; the divisibility in infinitum of any finite extension, involving us, whether we grant or deny it, in consequences impossible to be explicated, or made in our apprehensions consistent; consequences that carry greater

difficulty, and more apparent absurdity, than anything can follow from the notion of an immaterial knowing substance.

§32. We know nothing beyond our simple ideas. Which we are not at all to wonder at, since we having but some few superficial ideas of things, discovered to us only by the senses from without, or by the mind, reflecting on what it experiments in itself within, have no knowledge beyond that, much less of the internal constitution, and true nature of things, being destitute of faculties to attain it. And therefore experimenting and discovering in ourselves knowledge, and the power of voluntary motion, as certainly as we experiment, or discover in things without us, the cohesion and separation of solid parts, which is the extension and motion of bodies; we have as much reason to be satisfied with our notion of immaterial spirit, as with our notion of body, and the existence of the one, as well as the other. For it being no more a contradiction, that thinking should exist, separate, and independent from solidity: than 'tis a contradiction, that solidity should exist, separate, and independent from thinking, they being both but simple ideas, independent one from another; and having as clear and distinct ideas in us of thinking, as of solidity, I know not why we may not as well allow a thinking thing without solidity, i.e. immaterial, to exist, as a solid thing without thinking, i.e. matter, to exist; especially since 'tis no harder to conceive how thinking should exist without matter, than how matter should think. For whensoever we would proceed beyond these simple ideas we have from sensation and reflection, and dive further into the nature of things, we fall presently into darkness and obscurity, perplexedness and difficulties, and can discover nothing further but our own blindness and ignorance. But whichever of these complex ideas be clearest, that of body, or immaterial spirit, this is evident, that the simple ideas that make them up are no other than what we have received from sensation or reflection: and so is it of all our other ideas of substances, even of God himself.

§33. Idea of God. For if we examine the idea we have of the incomprehensible Supreme Being, we shall find, that we come by it the same way; and that the complex ideas we have both of God, and separate spirits, are made up of the simple ideas we receive from reflection; v.g. having, from what we experiment in ourselves, got the ideas of existence and duration; of knowledge and power; of pleasure and happiness; and of several other qualities and powers, which 'tis

better to have, than to be without; when we would frame an idea the most suitable we can to the Supreme Being, we enlarge every one of these with our idea of infinity; and so putting them together, make our complex idea of God. For that the mind has such a power of enlarging some of its ideas, received from sensation and reflection, has been already shown.

§34. If I find that I know some few things, and some of them, or all, perhaps imperfectly, I can frame an idea of knowing twice as many; which I can double again, as often as I can add to number; and thus enlarge my idea of knowledge, by extending its comprehension to all things existing, or possible. The same also I can do of knowing them more perfectly; i.e. all their qualities, powers, causes, consequences, and relations, etc. till all be perfectly known that is in them, or can any way relate to them: and thus frame the idea of infinite or boundless knowledge. The same may also be done of power, till we come to that we call infinite; and also of the duration of existence, without beginning or end, and so frame the idea of an eternal being. The degrees or extent wherein we ascribe existence, power, wisdom, and all other perfections (which we can have any ideas of) to that sovereign Being, which we call God, being all boundless and infinite, we frame the best idea of him our minds are capable of: all which is done, I say, by enlarging those simple ideas we have taken from the operations of our own minds, by reflection; or by our senses, from exterior things, to that vastness to which infinity can extend them.

§35. For 'tis infinity, which, joined to our ideas of existence, power, knowledge, etc. makes that complex idea, whereby we represent to ourselves, the best we can, the Supreme Being. For though in his own essence, (which certainly we do not know, not knowing the real essence of a pebble, or a fly, or of our own selves,) God be simple and uncompounded; yet I think, I may say we have no other idea of him, but a complex one of existence, knowledge, power, happiness, etc. infinite and eternal: which are all distinct ideas, and some of them, being relative, are again compounded of others: all which being, as has been shown, originally got from sensation and reflection, go to make up the idea or notion we have of God.

§36. No ideas in our complex one of spirits, but those got from sensation or reflection. This further is to be observed, that there is no

idea we attribute to God, bating infinity, which is not also a part of our complex idea of other spirits. Because, being capable of no other simple ideas, belonging to anything but body, but those which by reflection we receive from the operation of our own minds, we can attribute to spirits no other but what we receive from thence: and all the difference we can put between them, in our contemplation of spirits, is only in the several extents and degrees of their knowledge, power, duration, happiness, etc. For that in our ideas, as well of spirits as of other things, we are restrained to those we receive from sensation and reflection, is evident from hence, that in our ideas of spirits, how much soever advanced in perfection, beyond those of bodies, even to that of infinite, we cannot yet have any idea of the manner, wherein they discover their thoughts one to another: though we must necessarily conclude that separate spirits, which are beings that have perfecter knowledge, and greater happiness than we, must needs have also a perfecter way of communicating their thoughts than we have, who are fain to make use of corporeal signs, and particular sounds, which are therefore of most general use, as being the best and quickest we are capable of. But of immediate communication, having no experiment in ourselves, and consequently no notion of it at all, we have no idea how spirits, which use not words, can with quickness, or much less how spirits that have no bodies, can be masters of their own thoughts, and communicate or conceal them at pleasure, though we cannot but necessarily suppose they have such a power.

§37. Recapitulation. And thus we have seen, what kind of ideas we have of substances of all kinds, wherein they consist, and how we came by them. From whence, I think, 'tis very evident, First, that all our ideas of the several sorts of substances, are nothing but collections of simple ideas, with a supposition of something to which they belong, and in which they subsist: though of this supposed something we have no clear distinct idea at all.

Secondly, that all the simple ideas, that thus united in one common substratum, make up our complex ideas of several sorts of substances, are no other but such as we have received from sensation or reflection. So that even in those which we think we are most intimately acquainted with, and that come nearest the comprehension of our most enlarged conceptions, cannot reach beyond those simple ideas. And even in those, which seem most remote from all we have to do with, and do infinitely surpass anything we can perceive in

ourselves by reflection, or discover by sensation in other things, we can attain to nothing, but those simple ideas, which we originally received from sensation or reflection; as is evident in the complex ideas we have of angels, and particularly of God himself.

Thirdly, that most of the simple ideas that make up our complex ideas of substances, when truly considered, are only powers, however we are apt to take them for positive qualities; v.g. the greatest part of the ideas, that make our complex idea of gold, are yellowness, great weight, ductility, fusibility, and solubility in aqua regia, etc. all united together in an unknown substratum; all which ideas are nothing else but so many relations to other substances, and are not really in the gold, considered barely in itself, though they depend on those real, and primary qualities of its internal constitution, whereby it has a fitness, differently to operate, and be operated on by several other substances.

Chapter XXIV Of Collective Ideas of Substances

§1. one idea. Besides these complex ideas of several single substances, as of man, horse, gold, violet, apple, etc. the mind hath also complex collective ideas of substances; which I so call, because such ideas are made up of many particular substances considered together, as united into one idea, and which so joined, are looked on as one; v.g. the idea of such a collection of men as make an army, though consisting of a great number of distinct substances, is as much one idea as the idea of a man: and the great collective idea of all bodies whatsoever, signified by the name world, is as much one idea as the idea of any the least particle of matter in it; it sufficing to the unity of any idea, that it be considered as one representation, or picture, though made up of ever so many particulars.

§2. Made by the power of composing in the mind. These collective ideas of substances the mind makes by its power of composition, and uniting severally either simple or complex ideas into one, as it does, by the same faculty, make the complex ideas of particular substances, consisting of an aggregate of divers simple ideas, united in one substance: and as the mind, by putting together the repeated ideas of unity, makes the collective mode, or complex idea of any number, as a score, or a gross, etc., so, by putting together several particular substances, it makes collective ideas of substances, as a troop, an army, a swarm, a city, a fleet; each of which every one finds

that he represents to his own mind by one idea, in one view; and so under that notion considers those several things as perfectly one, as one ship, or one atom. Nor is it harder to conceive, how an army of ten thousand men should make one idea, than how a man should make one idea; it being as easy to the mind, to unite into one the idea of a great number of men, and consider it as one; as 'tis to unite into one particular, all the distinct ideas, that make up the composition of a man, and consider them all together as one.

§3. All artificial things are collective ideas. Amongst such kind of collective ideas, are to be counted most part of artificial things, at least such of them as are made up of distinct substances: and, in truth, if we consider all these collective ideas aright, as army, constellation, universe, as they are united into so many single ideas, they are but the artificial draughts of the mind; bringing things very remote, and independent on one another, into one view, the better to contemplate, and discourse of them, united into one conception, and signified by one name. For there are no things so remote, nor so contrary, which the mind cannot, by this art of composition, bring into one idea, as is visible in that signified by the name universe.

Chapter XXV Of Relation

§1. Relation what. Besides the ideas, whether simple or complex, that the mind has of things as they are in themselves, there are others it gets from their comparison one with another. The understanding, in the consideration of anything, is not confined to that precise object: it can carry an idea, as it were, beyond itself, or, at least, look beyond it, to see how it stands in conformity to any other. When the mind so considers one thing, that it does, as it were, bring it to, and set it by another, and carries its view from one to the other: this is, as the words import, relation and respect; and the denominations given to positive things, intimating that respect, and serving as marks to lead the thoughts beyond the subject itself denominated, to something distinct from it, are what we call relatives; and the things so brought together, related. Thus, when the mind considers Caius as such a positive being, it takes nothing into that idea, but what really exists in Caius; v.g. when I consider him, as a man, I have nothing in my mind, but the complex idea of the species, man. So likewise, when I say Caius is a white man, I have nothing but the bare consideration of a man, who hath that white colour. But

when I give Caius the name husband, I intimate some other person; and when I give him the name whiter, I intimate some other thing: in both cases my thought is led to something beyond Caius, and there are two things brought into consideration. And since any idea, whether simple, or complex, may be the occasion why the mind thus brings two things together, and, as it were, takes a view of them at once, though still considered as distinct; therefore any of our ideas may be the foundation of relation. As in the above-mentioned instance, the contract and ceremony of marriage with Sempronia, is the occasion of the denomination or relation of husband; and the colour white the occasion why he is said to be whiter than freestone.

§2. Relations without correlative terms, not easily perceived. These and the like relations, expressed by relative terms that have others answering them, with a reciprocal intimation, as father and son, bigger and less, cause and effect, are very obvious to every one, and everybody, at first sight, perceives the relation. For father and son, husband and wife, and such other correlative terms, seem so nearly to belong one to another, and, through custom, do so readily chime, and answer one another in people's memories, that upon the naming of either of them, the thoughts are presently carried beyond the thing so named; and nobody overlooks, or doubts of a relation, where 'tis so plainly intimated. But where languages have failed to give correlative names, there the relation is not always so easily taken notice of. Concubine is, no doubt, a relative name, as well as wife: but in languages where this, and the like words, have not a correlative term, there people are not so apt to take them to be so, as wanting that evident mark of relation, which is between correlatives, which seem to explain one another, and not to be able to exist, but together. Hence 'tis, that many of those names, which duly considered, do include evident relations, have been called external denominations. But all names, that are more than empty sounds, must signify some idea, which is either in the thing to which the name is applied, and then 'tis positive, and is looked on as united to, and existing in the thing to which the denomination is given: or else it arises from the respect the mind finds in it to something distinct from it, with which it considers it, and then it includes a relation.

§3. Some seemingly absolute terms contain relations. Another sort of relative terms there is, which are not looked on to be either relative, or so much as external denominations: which yet, under the

form and appearance of signifying something absolute in the subject, do conceal a tacit, though less observable, relation. Such are the seemingly positive terms of old, great, imperfect, etc, whereof I shall have occasion to speak more at large in the following chapters.

§4. Relation different from the things related. This further may be observed, That the ideas of relation may be the same in men, who have far different ideas of the things that are related, or that are thus compared: v.g. those who have far different ideas of a man, may yet agree in the notion of a father. which is a notion superinduced to the substance, or man, and refers only to an act of that thing called man; whereby he contributed to the generation of one of his own kind, let man be what it will.

§5. Change of relation may be without any change in the subject. The nature therefore of relation consists in the referring or comparing two things one to another; from which comparison one or both comes to be denominated. And if either of those things be removed, or cease to be, the relation ceases, and the denomination consequent to it, though the other receive in itself no alteration at all. V.g. Cajus, whom I consider today as a father, ceases to be so tomorrow, only by the death of his son, without any alteration made in himself. Nay, barely by the mind's changing the object, to which it compares anything, the same thing is capable of having contrary denominations at the same time. V.g. Cajus, compared to several persons, may truly be said to be older and younger, stronger and weaker, etc.

§6. Relation only betwixt two things. Whatsoever doth, or can exist, or be considered as one thing, is positive; and so not only simple ideas, and substances, but modes also are positive beings; though the parts of which they consist, are very often relative one to another; but the whole together considered as one thing, and producing in us the complex idea of one thing; which idea is in our minds, as one picture, though an aggregate of divers parts; and under one name, 'tis a positive or absolute thing, or idea. Thus a triangle, though the parts thereof, compared one to another, be relative, yet the idea of the whole is a positive absolute idea. The same may be said of a family, a tune, etc. for there can be no relation, but betwixt two things, considered as two things. There must always be in relation two ideas, or things, either in themselves really separate, or considered as

distinct, and then a ground or occasion for their comparison.

§7. All things capable of relation. Concerning relation in general, these things may be considered: First, that there is no one thing, whether simple idea, substance, mode, or relation, or name of either of them, which is not capable of almost an infinite number of considerations, in reference to other things: and therefore this makes no small part of men's thoughts and words. V.g. one single man may at once be concerned in, and sustain all these following relations, and many more, viz. father, brother, son, grandfather, grandson, father-in-law, son-in-law, husband, friend, enemy, subject, general, judge, patron, client, professor, European, Englishman, islander, servant, master, possessor, captain, superior, inferior, bigger, less, older, younger, contemporary, like, unlike, etc. to an almost infinite number: he being capable of as many relations, as there can be occasions of comparing him to other things, in any manner of agreement, disagreement, or respect whatsoever. For, as I said, relation is a way of comparing or considering two things together, and giving one, or both of them, some appellation from that comparison, and sometimes giving even the relation itself a name.

§8. The ideas of relations clearer often, than of the subjects related. Secondly, this further may be considered concerning relation, that though it be not contained in the real existence of things, but something extraneous and superinduced, yet the ideas which relative words stand for are often clearer, and more distinct, than of those substances to which they do belong. The notion we have of a father, or brother, is a great deal clearer, and more distinct, than that we have of a man: or, if you will, paternity is a thing whereof 'tis easier to have a clear idea, than of humanity: and I can much easier conceive what a friend is, than what God. Because the knowledge of one action, or one simple idea, is oftentimes sufficient to give me the notion of a relation; but to the knowing of any substantial being, an accurate collection of sundry ideas, is necessary. A man, if he compares two things together, can hardly be supposed not to know what 'tis, wherein he compares them: so that when he compares any things together, he cannot but have a very clear idea of that relation. The ideas, then, of relations, are capable at least of being more perfect and distinct in our minds, than those of substances. Because 'tis commonly hard to know all the simple ideas which are really in any substance, but for the most part easy enough to know the simple ideas that make up any relation I

think on, or have a name for. V.g. comparing two men in reference to one common parent, 'tis very easy to frame the ideas of brothers, without having yet the perfect idea of a man. For significant relative words, as well as others, standing only for ideas; and those being all either simple, or made up of simple ones, it suffices for the knowing the precise idea the relative term stands for, to have a clear conception of that, which is the foundation of the relation; which may be done without having a perfect and clear idea of the thing 'tis attributed to. Thus, having the notion that one laid the egg out of which the other was hatched, I have a clear idea of the relation of dam and chick, between the two cassiowaries in St. James's Park; though, perhaps, I have but a very obscure and imperfect idea of those birds themselves.

§9. Relations all terminate in simple ideas. Thirdly, though there be a great number of considerations, wherein things may be compared one with another, and so a multitude of relations, yet they all terminate in, and are concerned about those simple ideas, either of sensation or reflection, which I think to be the whole materials of all our knowledge. To clear this, I shall show it in the most considerable relations that we have any notion of; and in some that seem to be the most remote from sense or reflection: which yet will appear to have their ideas from thence, and leave it past doubt, that the notions we have of them, are but certain simple ideas, and so originally derived from sense or reflection.

§10. Terms leading the mind beyond the subject denominated, are relative. Fourthly, that relation being the considering of one thing with another which is extrinsical to it, 'tis evident that all words that necessarily lead the mind to any other ideas, than are supposed really to exist in that thing, to which the words are applied, are relative words. V.g. a man, black, merry, thoughtful, thirsty, angry, extended; these, and the like, are all absolute, because they neither signify nor intimate anything, but what does, or is supposed really to exist in the man thus denominated; but father, brother, king, husband, blacker, merrier, etc. are words which, together with the thing they denominate, imply also something else separate, and exterior to the existence of that thing.

§11. Conclusion. Having laid down these premises concerning relation in general, I shall now proceed to show, in some

instances, how all the ideas we have of relation are made up, as the others are, only of simple ideas; and that they all, how refined, or remote from sense soever they seem, terminate at last in simple ideas. I shall begin with the most comprehensive relation, wherein all things that do, or can exist, are concerned, and that is the relation of cause and effect: The idea whereof, how derived from the two fountains of all our knowledge, sensation and reflection, I shall in the next place consider.

Chapter XXVI Of Cause and Effect, and other Relations

§1. Whence their ideas got. In the notice, that our senses take of the constant vicissitude of things, we cannot but observe, that several particular, both qualities and substances, begin to exist; and that they receive this their existence from the due application and operation of some other being. From this observation, we get our ideas of cause and effect. That which produces any simple or complex idea, we denote by the general name cause, and that which is produced, effect. Thus, finding that in that substance which we call wax, fluidity, which is a simple idea, that was not in it before, is constantly produced by the application of a certain degree of heat, we call the simple idea of heat, in relation to fluidity in wax, the cause of it, and fluidity, the effect. So also finding that the substance, wood, which is a certain collection of simple ideas, so called by the application of fire, is turned into another substance, called ashes; i.e. another complex idea, consisting of a collection of simple ideas, quite different from that complex idea, which we call wood; we consider fire, in relation to ashes, as cause, and the ashes, as effect. So that whatever is considered by us, to conduce or operate, to the producing any particular simple idea, or collection of simple ideas, whether substance, or mode, which did not before exist, hath thereby in our minds the relation of a cause, and so is denominated by us.

§2. Creation, generation, making alteration. Having thus, from what our senses are able to discover in the operations of bodies on one another, got the notion of cause and effect, viz. that a cause is that which makes any other thing, either simple idea, substance, or mode, begin to be; and an effect is that which had its beginning from some other thing. The mind finds no great difficulty, to distinguish the several originals of things into two sorts: First, when the thing is wholly made new, so that no part thereof did ever exist before; as when a new particle of matter doth begin to exist, in rerum natura, which had before no being, and this we call creation.

Secondly, when a thing is made up of particles, which did all of them before exist; but that very thing, so constituted of pre-existing particles, which considered together, make up such a collection of simple ideas, had not any existence before, as this man, this egg,

rose, or cherry, etc. And this, when referred to a substance, produced in the ordinary course of nature, by internal principle, but set on work by, and received from, some external agent, or cause, and working by insensible ways, which we perceive not, we call generation; when the cause is extrinsical, and the effect produced by a sensible separation, or juxtaposition of discernible parts, we call it making; and such are all artificial things. When any simple idea is produced, which was not in that subject before, we call it alteration. Thus a man is generated, a picture made, and either of them altered, when any new sensible quality or simple idea, is produced in either of them, which was not there before; and the things thus made to exist, which were not there before, are effects; and those things which operated to the existence, causes. In which, and all other cases, we may observe, that the notion of cause and effect has its rise from ideas, received by sensation or reflection; and that this relation, how comprehensive soever, terminates at last in them. For to have the idea of cause and effect, it suffices to consider any simple idea, or substance, as beginning to exist, by the operation of some other, without knowing the manner of that operation.

§3. Relations of time. Time and place are also the foundations of very large relations, and all finite beings at least are concerned in them. But having already shown in another place, how we get those ideas, it may suffice here to intimate, that most of the denominations of things, received from time, are only relations: thus, when anyone says, that Queen Elizabeth, lived sixty-nine, and reigned forty-five years, these words import only the relation of that duration to some other, and mean no more but this, that the duration of her existence was equal to sixty-nine, and the duration of her government to forty-five annual revolutions of the sun; and so are all words, answering, how long. Again, William the Conqueror invaded England about the year 1070; which means this; that taking the duration from our Saviour's time, till now, for one entire great length of time, it shows at what distance this invasion was from the two extremes: and so do all words of time, answering to the question when, which show only the distance of any point of time from the period of a longer duration, from which we measure, and to which we thereby consider it, as related.

§4. Some ideas of time supposed positive and found to be relative. There are yet, besides those, other words of time, that

ordinarily are thought to stand for positive ideas, which yet will, when considered, be found to be relative; such as are, young, old, etc. which include and intimate the relation anything has to a certain length of duration, whereof we have the idea in our minds. Thus having settled in our thoughts the idea of the ordinary duration of a man to be seventy years, when we say a man is young, we mean that his age is yet but a small part of that which usually men attain to: and when we denominate him old, we mean that his duration is run out almost to the end of that which men do not usually exceed. And so 'tis but comparing the particular age, or duration of this or that man, to the idea of that duration which we have in our minds, as ordinarily belonging to that sort of animals: which is plain, in the application of these names to other things; for a man is called young at twenty years, and very young at seven years old: but yet a horse we call old at twenty, and a dog at seven years; because in each of these, we compare their age to different ideas of duration, which are settled in our minds, as belonging to these several sorts of animals, in the ordinary course of nature. But the Sun, and stars, though they have outlasted several generations of men, we call not old, because we do not know what period God hath set to that sort of beings. This term belonging properly to those things, which we can observe in the ordinary course of things, by a natural decay, to come to an end in a certain period of time; and so have in our minds, as it were, a standard, to which we can compare the several parts of their duration; and by the relation they bear thereunto, call them young, or old; which we cannot, therefore, do to a ruby, or a diamond, things whose usual periods we know not.

§5. Relations of place and extension. The relation also that things have to one another in their places and distances, is very obvious to observe; as above, below, a mile distant from Charingcross, in England, and in London. But as in duration, so in extension and bulk, there are some ideas that are relative, which we signify by names that are thought positive; as great and little, are truly relations. For here also, having, by observation, settled in our minds the ideas of the bigness of several species of things from those we have been most accustomed to, we make them as it were, the standards whereby to denominate the bulk of others. Thus we call a great apple, such a one as is bigger than the ordinary sort of those we have been used to; and a little horse, such a one as comes not up to the size of that idea, which we have in our minds, to belong ordinarily to horses: and that will be

a great horse to a Welchman, which is but a little one to a Fleming; they two having, from the different breed of their countries, taken several sized ideas to which they compare, and in relation to which they denominate their great, and their little.

§6. Absolute terms often stand for relations. So likewise weak and strong, are but relative denominations of power, compared to some ideas we have, at that time, of greater or less power. Thus when we say a weak man, we mean one that has not so much strength or power to move, as usually men have, or usually those of his size have; which is a comparing his strength to the idea we have of the usual strength of men, or men of such a size. The like when we say the creatures are all weak things; weak, there, is but a relative term, signifying the disproportion there is in the power of God and the creatures. And so abundance of words, in ordinary speech, stand only for relations, (and, perhaps, the greatest part,) which at first sight, seem to have no such signification: v.g. the ship has necessary stores. Necessary, and stores, are both relative words; one having a relation to the accomplishing the voyage intended, and the other to future use. All which relations, how they are confined to, and terminate in ideas derived from sensation or reflection, is too obvious to need any explication.

Chapter XXVII Of Identity and Diversity

§1. Wherein identity consists. Another occasion the mind often takes of comparing, is, the very being of things, when considering anything as existing at any determined time and place, we compare it with itself existing at another time, and thereon form the ideas of identity and diversity. When we see anything to be in any place in any instant of time, we are sure, (be it what it will) that 'tis that very thing, and not another, which at that same time exists in another place, how like and undistinguishable soever it may be in all other respects: and in this consists identity, when the ideas 'tis attributed to vary not at all from what they were that moment, wherein we consider their former existence, and to which we compare the present. For we never finding, nor conceiving it possible, that two things of the same kind should exist in the same place at the same time, we rightly conclude, that, whatever exists anywhere at any time, excludes all of the same kind, and is there itself alone. When therefore we demand, whether anything be the same or no' it refers always to something

that existed such a time in such a place, which 'twas certain, at that instant, was the same with itself, and no other: From whence it follows, that one thing cannot have two beginnings of existence, nor two things one beginning; it being impossible for two things of the same kind to be or exist in the same instant, in the very same place or one and the same thing in different places. That therefore that had one beginning, is the same thing, and that which had a different beginning in time and place from that, is not the same, but diverse. That which has made the difficulty about this relation, has been the little care and attention used in having precise notions of the things to which 'tis attributed.

§2. Identity of substances. We have the ideas but of three sorts of substances; 1. God. 2. Finite intelligences. 3. Bodies. First, God is without beginning, eternal, unalterable, and everywhere; and therefore concerning his identity, there can be no doubt. Secondly, Finite spirits having had each its determinate time and place of beginning to exist, the relation to that time and place will always determine to each of them its identity, as long as it exists.

Thirdly, the same will hold of every particle of matter, to which no addition or subtraction of matter being made, 'tis the same. For though these three sorts of substances, as we term them, do not exclude one another out of the same place; yet we cannot conceive but that they must necessarily each of them exclude any of the same kind out of the same place: or else the notions and names of identity and diversity would be in vain, and there could be no such distinctions of substances, or anything else one from another. For example: could two bodies be in the same place at the same time, then those two parcels of matter must be one and the same, take them great or little; nay, all bodies must be one and the same. For by the same reason that two particles of matter may be in one place, all bodies may be in one place: which, when it can be supposed, takes away the distinction of identity and diversity of one and more, and renders Identity of modes it ridiculous. But it being a contradiction, that two or more should be one, identity and diversity are relations and ways of comparing well founded, and of use to the understanding. All other things being but modes or relations ultimately terminated in substances, the identity and diversity of each particular existence of them too will be by the same way determined: only as to things whose existence is in succession, such as are the actions of finite beings, v.g. motion and

thought, both which consist in a continued train of succession, concerning their diversity, there can be no question: because each perishing the moment it begins, they cannot exist in different times, or in different places, as permanent beings can at different times exist in distant places; and therefore no motion or thought, considered as at different times, can be the same, each part thereof having a different beginning of existence.

§3. Principium individuationis. From what has been said, 'tis easy to discover what is so much inquired after, the principium individuationis, and that 'tis plain is existence itself, which determines a being of any sort to a particular time and place, incommunicable to two beings of the same kind. This, though it seems easier to conceive in simple substances or modes, yet, when reflected on, is not more difficult in compound ones, if care be taken to what 'tis applied; v.g. let us suppose an atom, i.e. a continued body under one immutable superficies, existing in a determined time and place; 'tis evident, that, considered in any instant of its existence, 'tis in that instant the same with itself. For, being at that instant what 'tis, and nothing else, 'tis the same, and so must continue as long as its existence is continued; for so long it will be the same, and no other. In like manner, if two or more atoms be joined together into the same mass, every one of those atoms will be the same, by the foregoing rule: and whilst they exist united together, the mass, consisting of the same atoms, must be the same mass, or the same body, let the parts be ever so differently jumbled: but if one of these atoms be taken away, or one new one added, 'tis no longer the same mass or the same body. In the state of living creatures, their identity depends not on a mass of the same particles, but on something else. For in them the variation of great parcels of matter alters not the identity: an oak growing from a plant to a great tree, and then lopped, is still the same oak; and a colt grown up to a horse, sometimes fat, sometimes lean, is all the while the same horse; though, in both these cases, there may be a manifest change of the parts: so that truly they are not either of them the same masses of matter, though they be truly one of them the same oak, and the other the same horse. The reason whereof is, that, in these two cases a mass of matter and a living body, identity is not applied to the same thing.

§4. Identity of vegetables. We must therefore consider wherein an oak differs from a mass of matter, and that seems to me to be in this,

that the one is only the cohesion of particles of matter anyhow united, the other such a disposition of them as constitutes the parts of an oak; and such an organization of those parts, as is fit to receive, and distribute nourishment, so as to continue, and frame the wood, bark, and leaves, etc. of an oak, in which consists the vegetable life. That being then one plant which has such an organization of parts in one coherent body, partaking of one common life, it continues to be the same plant, as long as it partakes of the same life, though that life be communicated to new particles of matter vitally united to the living plant, in a like continued organization, conformable to that sort of plants. For this organization, being at any one instant in any one collection of matter, is in that particular concrete distinguished from all other, and is that individual life, which existing constantly from that moment both forwards and backwards, in the same continuity of insensibly succeeding parts united to the living body of the plant, it has that identity, which makes the same plant, and all the parts of it, parts of the same plant, during all the time that they exist united in that continued organization, which is fit to convey that common life to all the parts so united.

§5. Identity of animals. The case is not so much different in brutes but that any one may hence see what makes an animal, and continues it the same. Something we have like this in machines, and may serve to illustrate it. For example, what is a watch? 'Tis plain 'tis nothing but a fit organization, or construction of parts, to a certain end, which, when a sufficient force is added to it, 'tis capable to attain. If we would suppose this machine one continued body, all whose organized parts were repaired, increased or diminished, by a constant addition or separation of insensible parts, with one common life, we should have something very much like the body of an animal, with this difference, that in an animal the fitness of the organization, and the motion wherein life consists, begin together, the motion coming from within; but in machines, the force, coming sensibly from without, is often away when the organ is in order, and well fitted to receive it.

§6. Identity of man. This also shows wherein the identity of the same man consists; viz. in nothing but a participation of the same continued life, by constantly fleeting particles of matter, in succession vitally united to the same organized body. He that shall place the identity of man in anything else, but, like that of other animals in one fitly organized body, taken in any one instant, and from thence

continued under one organization of life in several successively fleeting particles of matter, united to it, will find it hard to make an embryo, one of years, mad and sober, the same man, by any supposition, that will not make it possible for Seth, Ismael, Socrates, Pilate, St. Austin, and Caesar Borgia, to be the same man.

For if the identity of soul alone makes the same man, and there be nothing in the nature of matter, why the same individual spirit may not be united to different bodies, it will be possible, that those men, living in distant ages, and of different tempers, may have been the same man: which way of speaking must be, from a very strange use of the word man, applied to an idea, out of which body and shape is excluded: and that way of speaking would agree yet worse with the notions of those philosophers, who allow of transmigration, and are of opinion that the souls of men may, for their miscarriages, be detruded into the bodies of beasts, as fit habitations, with organs suited to the satisfaction of their brutal inclinations. But yet I think nobody, could he be sure that the soul of Heliogabalus were in one of his hogs, would yet say that hog were a man or Heliogabalus.

§7. Identity suited to the idea. 'Tis not therefore unity of substance that comprehends all sorts of identity, or will determine it in every case: but to conceive, and judge of it aright, we must consider what idea the word 'tis applied to stands for: it being one thing to be the same substance, another the same man, and a third the same person, if Person, man, and substance, are three names standing for three different ideas; for such as is the idea belonging to that name, such must be the identity; which, if it had been a little more carefully attended to, would possibly have prevented a great deal of that confusion, which often occurs about this matter, with no small seeming difficulties, especially concerning personal identity, which therefore we shall in the next place a little consider.

§8. Same man. An animal is a living organized body; and consequently the same animal, as we have observed, is the same continued life communicated to different particles of matter, as they happen successively to be united to that organized living body. And whatever is talked of other definitions, ingenious observation puts it past doubt, that the idea in our minds, of which the sound man in our mouths is the sign, is nothing else but of an animal of such a certain form: since I think I may be confident, that whoever should see a

creature of his own shape and make, though it had no more reason all its life, than a cat or a parrot, would call him still a man; or whoever should hear a cat or a parrot discourse, reason, and philosophize, would call or think it nothing but a cat or a parrot; and say, the one was a dull irrational man, and the other a very intelligent rational parrot. A relation we have in an author of great note, is sufficient to countenance the supposition of a rational parrot. His words are,

‘I had a mind to know, from Prince Maurice’s own mouth, the account of a common, but much credited story, that I had heard so often from many others of an old parrot he had in Brazil, during his government there, that spoke, and asked, and answered common questions like a reasonable creature: so that those of his train there, generally concluded it to be witchery or possession; and one of his chaplains, who lived long afterwards in Holland, would never from that time endure a parrot, but said they all had a devil in them. I had heard many particulars of this story, and assevered by people hard to be discredited, which made me ask Prince Maurice what there was of it. He said, with his usual plainness and dryness in talk, there was something true, but a great deal false of what had been reported. I desired to know of him, what there was of the first’ He told me short and coldly, that he had heard of such an old parrot when he had been at Brazil; and though he believed nothing of it, and it was a good way off, yet he had so much curiosity as to send for it, that it was a very great and a very old one; and when it came first into the room where the prince was, with a great many Dutchmen about him, it said presently, “what a company of white men are here” They asked it what he thought that man was, pointing to the prince’ It answered, “some general or other”; when they brought it close to him, he asked it, “D’où venez-vous” it answered, “De Marinnan.” The Prince, “A qui êtes-vous” The Parrot, “A un Portugais.” Prince, “Que fais-tu là” Parrot, “Je garde les poulles.” The Prince laughed, and said, “Vous gardez les poulles” The Parrot answered, “Oui, moi et je sais bien faire”; and made the chuck four or five times that people use to make to chickens when they call them. I set down the words of this worthy dialogue in French, just as Prince Maurice said them to me. I asked him in what language the parrot spoke, and he said, in Brazilian. I asked whether he understood Brazilian, he said No, but he had taken care to have two interpreters by him, the one a Dutchman, that spoke Brazilian, and the other a Brazilian, that spoke Dutch; that he asked them separately and privately, and both of them agreed in telling him

just the same thing that the parrot said. I could not but tell this odd story, because 'tis so much out of the way, and from the first hand, and what may pass for a good one; for I dare say this Prince, at least, believed himself in all he told me, having ever passed for a very honest and pious man: I leave it to naturalists to reason, and to other men to believe as they please upon it; however, 'tis not perhaps amiss to relieve or enliven a busy scene sometimes with such digressions, whether to the purpose or no.'

I have taken care that the reader should have the story at large in the author's own words, because he seems to me not to have thought it incredible; for it cannot be imagined that so able a man as he, who had sufficiency enough to warrant all the testimonies he gives of himself, should take so much pains, in a place where it had nothing to do, to pin so close, not only on a man whom he mentions as his friend, but on a Prince in whom he acknowledges very great honesty and piety, a story, which if he himself thought incredible, he could not but also think ridiculous. The Prince, 'tis plain, who vouches this story, and our author, who relates it from him, both of them call this talker a parrot: and I ask anyone else, who thinks such a story fit to be told, whether if this parrot, and all of its kind, had always talked, as we have a prince's word for it, this one did, whether, I say, they would not have passed for a race of rational animals; but yet whether, for all that, they would have been allowed to be men, and not parrots? For I presume 'tis not the idea of a thinking or rational being alone that makes the idea of a man in most people's sense; but of a body, so and so shaped, joined to it; and if that be the idea of a man, the same successive body not shifted all at once, must, as well as the same immaterial spirit, go to the making of the same man.

§9. Personal identity. This being premised, to find wherein personal identity consists, we must consider what person stands for; which, I think, is a thinking intelligent being, that has reason and reflection, and can consider itself as itself, the same thinking thing in different times and places; which it does only by that consciousness, which is inseparable from thinking, and as it seems to me essential to it: it being impossible for any one to perceive, without perceiving that he does perceive. When we see, hear, smell, taste, feel, meditate, or will anything, we know that we do so. Thus 'tis always as to our present sensations and perceptions: and by this every one is to himself that which he calls self; it not being considered in

this case, whether the same self be continued in the same, or divers substances. For since consciousness always accompanies thinking, and 'tis that which makes every one to be what he calls self, and thereby distinguishes himself from all other thinking things; in this alone consists personal identity, i.e. the sameness of a rational being; and as far as this consciousness can be extended backwards to any past action or thought, so far reaches the identity of that person; 'tis the same self now it was then; and 'tis by the same self with this present one that now reflects on it, that that action was done.

§10. Consciousness makes personal identity. But 'tis further inquired, whether it be the same identical substance? This, few would think they had reason to doubt of, if these perceptions, with their consciousness, always remained present in the mind, whereby the same thinking thing would be always consciously present, and, as would be thought, evidently the same to itself. But that which seems to make the difficulty, is this, that this consciousness being interrupted always by forgetfulness, there being no moment of our lives wherein we have the whole train of all our past actions before our eyes in one view: but even the best memories losing the sight of one part whilst they are viewing another; and we sometimes, and that the greatest part of our lives, not reflecting on our past selves, being intent on our present thoughts, and in sound sleep, having no thoughts at all, or, at least, none with that consciousness which remarks our waking thoughts. I say, in all these cases, our consciousness being interrupted, and we losing the sight of our past selves, doubts are raised whether we are the same thinking thing, i.e. the same substance or no. Which, however reasonable, or unreasonable, concerns not personal identity at all. The question being what makes the same person; and not whether it be the same identical substance, which always thinks in the same person, which, in this case, matters not at all. Different substances, by the same consciousness, (where they do partake in it) being united into one person, as well as different bodies, by the same life are united into one animal, whose identity is preserved, in that change of substances, by the unity of one continued life. For it being the same consciousness that makes a man be himself to himself, personal identity depends on that only, whether it be annexed only to one individual substance, or can be continued in a succession of several substances. For as far as any intelligent being can repeat the idea of any past action with the same consciousness it had of it at first, and with the same consciousness it has of any present action; so far 'tis the

same personal self. For 'tis by the consciousness it has of its present thoughts and actions, that 'tis self to itself now, and so will be the same self, as far as the same consciousness can extend to actions past or to come; and would be by distance of time, or change of substance, no more two persons, than a man be two men, by wearing other clothes today than he did yesterday, with a long or short sleep between: the same consciousness uniting those distant actions into the same person, whatever substances contributed to their production.

§11. Personal identity in change of substances. That this is so, we have some kind of evidence in our very bodies, all whose particles, whilst vitally united to this same thinking conscious self, so that we feel when they are touched, and are affected by, and conscious of good or harm that happens to them, as a part of ourselves; i.e. of our thinking conscious self. Thus the limbs of his body are to every one a part of himself: he sympathizes and is concerned for them. Cut off a hand, and thereby separate it from that consciousness we had of its heat, cold, and other affections, and 'tis then no longer a part of that which is himself, any more than the remotest part of matter. Thus, we see the substance, whereof personal self consisted at one time, may be varied at another, without the change of personal identity; there being no question about the same person, though the limbs, which but now were a part of it, be cut off.

§12. Whether in the change of thinking substances. But the question is, Whether if the same substance, which thinks, be changed, it can be the same person, or remaining the same, it can be different persons. And to this I answer, first, this can be no question at all to those, who place thought in a purely material, animal constitution, void of an immaterial substance. For, whether their supposition be true or no, 'tis plain they conceive personal identity preserved in something else than identity of substance; as animal identity is preserved in identity of life, and not of substance. And therefore those who place thinking in an immaterial substance only, before they can come to deal with these men, must show why personal identity cannot be preserved in the change of immaterial substances, or variety of particular immaterial substances, as well as animal identity is preserved in the change of material substances, or variety of particular bodies: unless they will say, 'tis one immaterial spirit that makes the same life in brutes; as 'tis one immaterial spirit that makes the same person in men, which the Cartesians at least will not admit, for fear of

making brutes thinking things too.

§13. Whether in change of thinking substances there can be one person. But next, as to the first part of the question, whether if the same thinking substance (supposing immaterial substances only to think) be changed, it can be the same person' I answer, that cannot be resolved, but by those who know what kind of substances they are that do think; and whether the consciousness of past actions can be transferred from one thinking substance to another. I grant were the same consciousness the same individual action it could not: but it being a present representation of a past action, why it may not be possible, that that may be represented to the mind to have been which really never was, will remain to be shown. And therefore how far the consciousness of past actions is annexed to any individual agent, so that another cannot possibly have it, will be hard for us to determine, till we know what kind of action 'tis; that cannot be done without a reflex act of perception accompanying it, and how performed by thinking substances, who cannot think without being conscious of it. But that which we call the same consciousness, not being the same individual act, why one intellectual substance may not have represented to it, as done by itself, what it never did, and was perhaps done by some other agent: why, I say, such a representation may not possibly be without reality of matter of fact, as well as several representations in dreams are, which yet, whilst dreaming, we take for true, will be difficult to conclude from the nature of things. And that it never is so, will by us, till we have clearer views of the nature of thinking substances, be best resolved into the goodness of God, who, as far as the happiness or misery of any of his sensible creatures is concerned in it, will not, by a fatal error of theirs, transfer from one to another that consciousness which draws reward or punishment with it. How far this may be an argument against those who would place thinking in a system of fleeting animal spirits, I leave to be considered. But yet, to return to the question before us, it must be allowed, that, if the same consciousness (which, as has been shown, is quite a different thing from the same numerical figure or motion in body) can be transferred from one thinking substance to another, it will be possible, that two thinking substances may make but one person. For the same consciousness being preserved, whether in the same or different substances, the personal identity is preserved'

§14. Whether, the same immaterial substance remaining, there

can be two persons. As to the second part of the question, Whether the same immaterial substance remaining, there may be two distinct persons' which question seems to me to be built on this, whether the same immaterial being, being conscious of the action of its past duration, may be wholly stripped of all the consciousness of its past existence, and lose it beyond the power of ever retrieving it again: and so as it were beginning a new account from a new period, have a consciousness that cannot reach beyond this new state. All those who hold preexistence, are evidently of this mind. since they allow the soul to have no remaining consciousness of what it did in that pre-existent state, either wholly separate from body, or informing any other body; and if they should not, 'tis plain, experience would be against them. So that personal identity, reaching no further than consciousness reaches, a preexistent spirit not having continued so many ages in a state of silence, must needs make different persons. Suppose a Christian Platonist or a Pythagorean,, should, upon God's having ended all his works of creation the seventh day, think his soul hath existed ever since; and should imagine it has revolved in several human bodies, as I once met with one, who was persuaded his had been the soul of Socrates, (how reasonably I will not dispute. this I know, that in the post he filled, which was no inconsiderable one, he passed for a very rational man; and the press has shown that he wanted not parts or learning) would any one say, that he being not conscious of any of Socrates's actions or thoughts, could be the same person with Socrates' Let any one reflect upon himself, and conclude, that he has in himself an immaterial spirit, which is that which thinks in him, and, in the constant change of his body keeps him the same, and is that which he calls himself: let him also suppose it to be the same soul that was in Nestor or Thersites, at the siege of Troy, (for souls being, as far as we know anything of them, in their nature, indifferent to any parcel of matter, the supposition has no apparent absurdity in it) which it may have been, as well as 'tis now, the soul of any other man: but he now having no consciousness of any of the actions either of Nestor or Thersites, does or can he, conceive himself the same person with either of them' Can he be concerned in either of their actions' Attribute them to himself, or think them his own, more than the actions of any other man that ever existed' So that this consciousness not reaching to any of the actions of either of those men, he is no more one self with either of them than if the soul or immaterial spirit that now informs him, had been created, and began to exist, when it began to inform his present body, though it were

never so true, that the same spirit that informed Nestor's or Thersites' body, were numerically the same that now informs his. For this would no more make him the same person with Nestor, than if some of the particles of matter that were once a part of Nestor, were now a part of this man; the same immaterial substance, without the same consciousness, no more making the same person by being united to any body, than the same particle of matter, without consciousness, united to any body, makes the same person. But let him once find himself conscious of any of the actions of Nestor, he then finds himself the same person with Nestor.

§15. The body, as well as the soul, goes to the making of a man. And thus we may be able, without any difficulty, to conceive the same person at the resurrection, though in a body not exactly in make or parts the same which he had here, the same consciousness going along with the soul that inhabits it. But yet the soul alone, in the change of bodies, would scarce to anyone, but to him that makes the soul the man, be enough to make the same man. For should the soul of a prince, carrying with it the consciousness of the prince's past life, enter and inform the body of a cobbler, as soon as deserted by his own soul, everyone sees he would be the same person with the prince, accountable only for the prince's actions: but who would say it was the same man? The body too goes to the making the man, and would, I guess, to everybody, determine the man in this case, wherein the soul, with all its princely thoughts about it, would not make another man: but he would be the same cobbler to everyone besides himself. I know that, in the ordinary way of speaking, the same person, and the same man, stand for one and the same thing. And indeed every one will always have a liberty to speak, as he pleases, and to apply what articulate sounds to what ideas he thinks fit, and change them as often as he pleases. But yet, when we will inquire what makes the same spirit, man, or person, we must fix the ideas of spirit, man, or person, in our minds; and having resolved with ourselves what we mean by them, it will not be hard to determine in either of them, or the like, when 'tis the same, and when not.

§16. Consciousness makes the same person. But though the same immaterial substance or soul, does not alone, wherever it be, and in whatsoever state, make the same man; yet 'tis plain, consciousness, as far as ever it can be extended, should it be to ages past, unites existences and actions, very remote in time, into the same person, as

well as it does the existences and actions of the immediately preceding moment: so that whatever has the consciousness of present and past actions, is the same person to whom they both belong. Had I the same consciousness that I saw the ark and Noah's flood, as that I saw an overflowing of the Thames last winter, or as that I write now, I could no more doubt that I who write this now, that saw the Thames overflowed last winter, and that viewed the flood at the general deluge, was the same self, place that self in what substance you please, than that I that write this am the same myself now whilst I write (whether I consist of all the same substance, material or immaterial, or no) that I was yesterday. For as to this point of being the same self, it matters not whether this present self be made up of the same or other substances, I being as much concerned, and as justly accountable for any action was that done a thousand years since, appropriated to me now by this self-consciousness, as I am for what I did the last moment.

§17. Self depends on consciousness. Self is that conscious thinking thing, (whatever substance, made up of whether spiritual, or material, simple, or compounded, it matters not) which is sensible, or conscious of pleasure and pain, capable of happiness or misery, and so is concerned for itself, as far as that consciousness extends. Thus everyone finds, that whilst comprehended under that consciousness, the little finger is as much a part of himself, as what is most so. Upon separation of this little finger, should this consciousness go along with the little finger, and leave the rest of the body, 'tis evident the little finger would be the person, the same person; and self then would have nothing to do with the rest of the body. As in this case 'tis the consciousness that goes along with the substance, when one part is separate from another, which makes the same person, and constitutes this inseparable self: so 'tis in reference to substances remote in time. That with which the consciousness of this present thinking thing can join itself, makes the same person, and is one self with it, and with nothing else; and so attributes to itself, and owns all the actions of that thing, as its own, as far as that consciousness reaches, and no further; as every one who reflects will perceive.

§18. Object of reward and punishment. In this personal identity, is founded all the right and justice of reward and punishment; happiness and misery being that for which every one is concerned for himself, not mattering what becomes of any substance, not joined to, or

affected with that consciousness. For, as 'tis evident in the instance I gave but now, if the consciousness went along with the little finger, when it was cut off, that would be the same self which was concerned for the whole body yesterday, as making part of itself, whose actions then it cannot but admit as its own now. Though, if the same body should still live, and immediately, from the separation of the little finger have its own peculiar consciousness, whereof the little finger knew nothing, it would not at all be concerned for it, as a part of itself, or could own any of its actions, or have any of them imputed to him.

§19. Which shows wherein personal identity consists. This may show us wherein personal identity consists, not in the identity of substance, but, as I have said, in the identity of consciousness, wherein if Socrates and the present mayor of Queinborough agree, they are the same person: if the same Socrates, waking and sleeping do not partake of the same consciousness, Socrates waking and sleeping, is not the same person. And to punish Socrates waking, for what sleeping Socrates thought, and waking Socrates was never conscious of, would be no more of right, than to punish one twin for what his brother-twin did, whereof he knew nothing, because their outsides were so like, that they could not be distinguished; for such twins have been seen.

§20. Absolute oblivion separates what is thus forgotten from the person, but not from the man. But yet possibly it will still be objected, suppose I wholly lose the memory of some parts of my life, beyond a possibility of retrieving them, so that perhaps I shall never be conscious of them again; yet am I not the same person that did those actions, had those thoughts, that I was once conscious of, though I have now forgot them? To which I answer, that we must here take notice what the word I is applied to; which, in this case, is the man only. And the same man being presumed to be the same person, I is easily here supposed to stand also for the same person. But if it be possible for the same man to have distinct incommunicable consciousness at different times, 'tis past doubt the same man would at different times make different persons; which, we see, is the sense of mankind in the solemnest declaration of their opinions, human laws not punishing the mad man for the sober man's actions, nor the sober man for what the mad man did, thereby making them two persons: which is somewhat explained by our way of speaking in English, when we say such an one is 'not himself,' or is 'beside himself'; in which

phrases 'tis insinuated, as if those who now, or at least first used them, thought that self was changed; the selfsame person was no longer in that man.

§21. Difference between identity of man and of person. But yet 'tis hard to conceive that Socrates, the same individual man, should be two persons. To help us a little in this, we must consider what is meant by Socrates, or the same individual man.

First, it must be either the same individual, immaterial, thinking substance; in short, the same numerical soul, and nothing else.

Secondly, or the same animal, without any regard to an immaterial soul.

Thirdly, or the same immaterial spirit united to the same animal.

Now, take which of these suppositions you please, 'tis impossible to make personal identity to consist in anything but consciousness; or reach any further than that does.

For by the first of them, it must be allowed possible, that a man born of different women, and in distant times, may be the same man.

A way of speaking which, whoever admits, must allow it possible, for the same man to be two distinct persons, as any two that have lived in different ages, without the knowledge of one another's thoughts.

By the second and third, Socrates, in this life, and after it, cannot be the same man any way, but by the same consciousness; and so making human identity to consist in the same thing wherein we place personal identity, there will be no difficulty to allow the same man to be the same person. But then they who place human identity in consciousness only, and not in something else, must consider how they will make the infant Socrates the same man with Socrates after the resurrection. But whatsoever to some men makes a man, and consequently the same individual man, wherein perhaps few are agreed, personal identity can by us be placed in nothing but consciousness, (which is that alone which makes what we call self) without involving us in great absurdities.

§22. But is not a man drunk and sober the same person, why else

is he punished for the fact he commits when drunk, though he be never afterwards conscious of it' Just as much the same person, as a man that walks, and does other things in his sleep, is the same person, and is answerable for any mischief he shall do in it. Human laws punish both, with a justice suitable to their way of knowledge; because in these cases, they cannot distinguish certainly what is real, what counterfeit: and so the ignorance in drunkenness or sleep, is not admitted as a plea. For though punishment be annexed to personality, and personality to consciousness, and the drunkard perhaps be not conscious of what he did, yet human judicatures justly punish him; because the fact is proved against him, but want of consciousness cannot be proved for him. But in the great day, wherein the secrets of all hearts shall be laid open, it may be reasonable to think, no one shall be made to answer for what he knows nothing of, but shall receive his doom, his conscience accusing or excusing him.

§23. Consciousness alone makes self. Nothing but consciousness can unite remote existences into the same person: the identity of substance will not do it; for whatever substance there is, however framed, without consciousness there is no person: and a carcass may be a person, as well as any sort of substance be so, without consciousness.

Could we suppose two distinct incommunicable consciousnesses acting the same body, the one constantly by day, the other by night; and, on the other side, the same consciousness, acting by intervals, two distinct bodies: I ask, in the first case, whether the day and the night man would not be two as distinct persons as Socrates and Plato? And whether, in the second case, there would not be one person in two distinct bodies, as much as one man is the same in two distinct clothings. Nor is it at all material to say, that this same, and this distinct consciousness, in the cases above-mentioned, is owing to the same and distinct immaterial substances, bringing it with them to those bodies; which, whether true or no, alters not the case: since 'tis evident the personal identity would equally be determined by the consciousness, whether that consciousness were annexed to some individual immaterial substance, or no. For, granting, that the thinking substance in man must be necessarily supposed immaterial, 'tis evident, that immaterial thinking thing may sometimes part with its past consciousness, and be restored to it again: as appears in the forgetfulness men often have of their past actions, and the mind

many times recovers the memory of a past consciousness, which it had lost for twenty years together. Make these intervals of memory and forgetfulness to take their turns regularly by day and night, and you have two persons with the same immaterial spirit, as much as in the former instance two persons with the same body. So that self is not determined by identity or diversity of substance, which it cannot be sure of, but only by identity of consciousness.

§24. Not the substance with which the consciousness may be united. Indeed it may conceive the substance whereof 'tis now made up, to have existed formerly, united in the same conscious being: but consciousness removed, that substance is no more itself, or makes no more a part of it, than any other substance, as is evident in the instance we have already given of a limb cut off, of whose heat, or cold, or other affections, having no longer any consciousness, 'tis no more of a man's self than any other matter of the universe. In like manner it will be in reference to any immaterial substance, which is void of that consciousness whereby I am myself to myself: if there be any part of its existence, which I cannot upon recollection join with that present consciousness, whereby I am now myself, 'tis in that part of its existence, no more myself, than any other immaterial being. For whatsoever any substance has thought or done, which I cannot recollect, and by my consciousness make my own thought and action, it will no more belong to me, whether a part of me thought or did it, than if it had been thought or done by any other immaterial being anywhere existing.

§25. I agree, the more probable opinion is, that this consciousness is annexed to, and the affection of, one individual immaterial substance.

But let men, according to their diverse hypotheses, resolve of that as they please. This every intelligent being, sensible of happiness or misery, must grant that there is something that is himself that he is concerned for, and would have happy; that this self has existed in a continued duration more than one instant, and therefore 'tis possible may exist, as it has done, months and years to come, without any certain bounds to be set to its duration; and may be the same self, by the same consciousness continued on for the future. And thus, by this consciousness he finds himself to be the same self which did such and such an action some years since, by which he comes to be happy or

miserable now. In all which account of self, the same numerical substance is not considered as making the same self, but the same continued consciousness, in which several substances may have been united, and again separated from it, which, whilst they continued in a vital union with that, wherein this consciousness then resided, made a part of that same self. Thus any part of our bodies vitally united to that which is conscious in us, makes a part of ourselves: but upon separation from the vital union by which that consciousness is communicated, that which a moment since was part of ourselves, is now no more so, than a part of another man's self is a part of me: and 'tis not impossible, but in a little time may become a real part of another person. And so we have the same numerical substance become a part of two different persons; and the same person preserved under the change of various substances. Could we suppose any spirit wholly stripped of all its memory or consciousness of past actions, as we find our minds always are of a great part of ours, and sometimes of them all, the union or separation of such a spiritual substance would make no variation of personal identity, any more than that of any particle of matter does. Any substance vitally united to the present thinking being, is a part of that very same self which now is: anything united to it by a consciousness of former actions, makes also a part of the same self, which is the same both then and now.

§26. Person, a forensic term Person, as I take it, is the name for this self. Wherever a man finds what he calls himself, there I think, another may say is the same person. 'Tis a forensic term appropriating actions and their merit; and so belongs only to intelligent agents, capable of a law, and happiness, and misery. This personality extends itself beyond present existence to what is past, only by consciousness, whereby it becomes concerned and accountable; owns and imputes to itself past actions, just upon the same ground, and for the same reason that it does the present. All which is founded in a concern for happiness, the unavoidable concomitant of consciousness, that which is conscious of pleasure and pain, desiring that that self that is conscious, should be happy. And therefore whatever past actions it cannot reconcile, or appropriate to that present self by consciousness, it can be no more concerned in, than if they had never been done: and to receive pleasure or pain, i.e. reward or punishment, on the account of any such action, is all one, as to be made happy or miserable in its first being, without any demerit at all. For, supposing a man punished now for what he had done in

another life, whereof he could be made to have no consciousness at all, what difference is there between that punishment, and being created miserable? And therefore conformable to this, the apostle tells us, that, at the great day, when every one shall 'receive according to his doings, the secrets of all hearts shall be laid open.' The sentence shall be justified by the consciousness all persons shall have, that they themselves, in what bodies soever they appear, or what substances soever that consciousness adheres to, are the same that committed those actions, and deserve that punishment for them.

§27. Suppositions that look strange are pardonable in our ignorance.

I am apt enough to think I have, in treating of this subject, made some suppositions that will look strange to some readers, and possibly they are so in themselves. But yet, I think, they are such as are pardonable in this ignorance we are in of the nature of that thinking thing that is in us, and which we look on as ourselves. Did we know what it was, or how it was tied to a certain system of fleeting animal spirits; or whether it could, or could not perform its operations of thinking and memory out of a body organized as ours is; and whether it has pleased God, that no one such spirit shall ever be united to any but one such body, upon the right constitution of whose organs its memory should depend, we might see the absurdity of some of those suppositions I have made. But taking, as we ordinarily now do (in the dark concerning these matters) the soul of a man, for an immaterial substance, independent from matter, and indifferent alike to it all; there can, from the nature of things be no absurdity at all, to suppose, that the same soul may, at different times, be united to different bodies, and with them make up, for that time, one man: as well as we suppose a part of a sheep's body yesterday, should be a part of a man's body tomorrow, and in that union make a vital part of Meliboeus himself, as well as it did of his ram.

§28. The difficulty from ill use of names. To conclude, whatever substance begins to exist, it must, during its existence, necessarily be the same: whatever compositions of substances begin to exist, during the union of those substances, the concrete must be the same: whatsoever mode begins to exist, during its existence, 'tis the same: and so if the composition be of distinct substances, and different modes, the same rule holds. Whereby it will appear, that the difficulty

or obscurity that has been about this matter, rather rises from the names illused, than from any obscurity in things themselves. For whatever makes the specific idea, to which the name is applied, if that idea be steadily kept to, the distinction of anything into the same, and divers will easily be conceived, and there can arise no doubt about it.

§29. Continuance existence makes identity. For supposing a rational spirit be the idea of a man, 'tis easy to know, what is the same man, viz. the same spirit, whether separate or in a body, will be the same man. Supposing a rational spirit vitally united to a body of a certain conformation of parts to make a man, whilst that rational spirit, with that vital conformation of parts, though continued in a fleeting successive body, remains, it will be the same man. But if to any one the idea of a man be but the vital union of parts in a certain shape; as long as that vital union and shape remain, in a concrete no otherwise the same, but by a continued succession of fleeting particles, it will be the same man. For, whatever be the composition, whereof the complex idea is made, whenever existence makes it one particular thing under any denomination, the same existence continued preserves it the same individual under the same denomination.

Chapter XXVIII Of other Relations

§1. Proportional. Besides the before-mentioned occasions of time, place, and causality of comparing, or referring things one to another, there are, as I have said, infinite others, some whereof I shall mention.

First, The first I shall name is some one simple idea, which, being capable of parts or degrees, affords an occasion of comparing the subjects wherein 'tis to one another, in respect of that simple idea, v.g. whiter, sweeter, bigger, equal, more, etc. These relations depending on the equality and excess of the same simple idea, in several subjects, may be called, if one will, proportional; and that these are only conversant about those simple ideas received from sensation or reflection is so evident that nothing need be said to evince it.

§2. Natural. Secondly, another occasion of comparing things together, or considering one thing, so as to include in that consideration some other thing, is the circumstances of their origin or beginning; which being not afterwards to be altered, make the

relations depending thereon as lasting as the subjects to which they belong, v.g. father and son, brothers, cousin-germans, etc. which have their relations by one community of blood, wherein they partake in several degrees: country-men, i.e. those who were born in the same country or tract of ground; and these I call natural relations: wherein we may observe, that mankind have fitted their notions and words to the use of common life, and not to the truth and extent of things. For 'tis certain, that in reality, the relation is the same, betwixt the begetter and the begotten, in the several races of other animals as well as men; but yet 'tis seldom said, this bull is the grandfather of such a calf, or that two pigeons are cousin-germans. 'Tis very convenient, that by distinct names these relations should be observed, and marked out in mankind, there being occasion, both in laws, and other communications one with another, to mention and take notice of men under these relations: from whence also arise the obligations of several duties amongst men: whereas in brutes, men having very little or no cause to mind these relations, they have not thought fit to give them distinct and peculiar names. This, by the way, may give us some light into the different state and growth of languages; which being suited only to the convenience of communication, are proportioned to the notions men have, and the commerce of thoughts familiar amongst them; and not to the reality or extent of things, nor to the various respects might be found among them; nor the different abstract considerations might be framed about them. Where they had no philosophical notions, there they had no terms to express them: and 'tis no wonder men should have framed no names for those things they found no occasion to discourse of. From whence 'tis easy to imagine why, as in some countries, they may not have so much as the name for a horse; and in others, where they are more careful of the pedigrees of their horses than of their own, that there they may have not only names for particular horses, but also of their several relations of kindred one to another.

§3. Instituted. Thirdly, sometimes the foundation of considering things, with reference to one another, is some act whereby anyone comes by a moral right, power, or obligation to do something. Thus, a general is one that hath power to command an army; and an army under a general is a collection of armed men obliged to obey one man. A citizen, or a burgher, is one who has a right to certain privileges in this or that place. All this sort depending upon men's wills, or agreement in society, I call instituted, or voluntary; and may be

distinguished from the natural, in that they are most, if not all of them, some way or other alterable, and separable from the persons, to whom they have sometimes belonged, though neither of the substances, so related, be destroyed. Now, though these are all reciprocal, as well as the rest, and contain in them a reference of two things, one to the other; yet, because one of the two things often wants a relative name, importing that reference, men usually take no notice of it, and the relation is commonly overlooked: v.g. a patron and client, are easily allowed to be relations, but a constable or dictator are not so readily at first hearing considered as such. Because there is no peculiar name for those who are under the command of a dictator, or constable, expressing a relation to either of them; though it be certain, that either of them hath a certain power over some others; and so is so far related to them, as well as a patron is to his client, or general to his army.

§4. Moral. Fourthly, there is another sort of relation, which is the conformity, or disagreement, men's voluntary actions have to a rule to which they are referred, and by which they are judged of; which, I think, may be called moral relation, as being that which denominates our moral actions, and deserves well to be examined; there being no part of knowledge wherein we should be more careful to get determined ideas, and avoid, as much as may be, obscurity and confusion. Human actions, when with their various ends, objects, manners, and circumstances, they are framed into distinct complex ideas, are, as has been shown, so many mixed modes, a great part whereof have names annexed to them. Thus, supposing gratitude to be a readiness to acknowledge and return kindness received; polygamy to be the having more wives than one at once: when we frame these notions thus in our minds, we have there so many determined ideas of mixed modes. But this is not all that concerns our actions: 'tis not enough to have determined ideas of them, and to know what names belong to such and such combinations of ideas. We have a further and greater concernment, and that is, to know whether such actions so made up are morally good or bad.

§5. Moral good and evil. Good and evil, as hath been shown, B. II. CH. XX. § 2, and CH. XXI. § 42. are nothing but pleasure or pain, or that which occasions or procures pleasure or pain to us. Moral good and evil, then, is only the conformity or disagreement of our voluntary actions to some law, whereby good or evil is drawn on us from the

will and power of the law-maker; which good and evil, pleasure or pain, attending our observance, or breach of the law, by the decree of the law-maker, is that we call reward and punishment.

§6. Moral rules. Of these moral rules, or laws, to which men generally refer, and by which they judge of the rectitude or pravity of their actions, there seem to me to be three sorts, with their three different enforcements, or rewards and punishments. For, since it would be utterly in vain to suppose a rule set to the free actions of man, without annexing to it some enforcement of good and evil to determine his will, we must, wherever we suppose a law, suppose also some reward or punishment annexed to that law. It would be in vain for one intelligent being to set a rule to the actions of another, if he had it not in his power to reward the compliance with, and punish deviation from his rule, by some good and evil, that is not the natural product and consequence of the action itself. For that being a natural convenience, or inconvenience, would operate of itself without a law. This, if I mistake not, is the true nature of all law, properly so called.

§7. Laws. The laws that men generally refer their actions to, to judge of their rectitude or obliquity, seem to me to be these three: 1. The divine law. 2. The civil law. 3. The law of opinion or reputation, if I may so call it. By the relation they bear to the first of these, men judge whether their actions are sins, or duties; by the second, whether they be criminal, or innocent; and by the third, whether they be virtues or vices.

§8. Divine law, the measure of sin and duty. First, the divine law, whereby I mean, that law which God has set to the actions of men, whether promulgated to them by the light of nature, or the voice of revelation. That God has given a rule whereby men should govern themselves, I think there is nobody so brutish as to deny. He has a right to do it; we are his creatures: He has goodness and wisdom to direct our actions to that which is best: and he has power to enforce it by rewards and punishments of, infinite weight and duration in another life; for nobody can take us out of his hands. This is the only true touchstone of moral rectitude; and, by comparing them to this law, 'tis that men judge of the most considerable moral good or evil of their actions; that is, whether as duties, or sins, they are like to procure them happiness or misery from the hands of the ALMIGHTY.

§9. Civil law, the measure of crimes and innocence. Secondly, the

civil law, the rule set by the commonwealth to the actions of those who belong to it, is another rule to which men refer their actions; to judge whether they be criminal or no. This law nobody overlooks: the rewards and punishments that enforce it being ready at hand, and suitable to the power that makes it: which is the force of the Commonwealth, engaged to protect the lives, liberties, and possessions of those who live according to its laws, and has power to take away life, liberty, or goods from him who disobeys; which is the punishment of offences committed against his law.

§10. Philosophical law, the measure of virtue and vice. Thirdly, the law of opinion or reputation. Virtue and vice are names pretended and supposed everywhere to stand for actions in their own nature right and wrong: and as far as they really are so applied, they so far are coincident with the divine law above-mentioned. But yet, whatever is pretended, this is visible, that these names, virtue and vice, in the particular instances of their application, through the several nations and societies of men in the world, are constantly attributed only to such actions, as in each country and society are in reputation or discredit. Nor is it to be thought strange, that men everywhere should give the name of virtue to those actions, which amongst them are judged praise-worthy; and call that vice, which they account blamable: since otherwise they would condemn themselves, if they should think anything right, to which they allowed not commendation, anything wrong, which they let pass without blame. Thus the measure of what is everywhere called and esteemed virtue and vice, is this approbation or dislike, praise or blame, which by a secret and tacit consent establishes itself in the several societies, tribes, and clubs of men in the world; whereby several actions come to find credit or disgrace amongst them, according to the judgment, maxims, or fashion of that place. For though men uniting into politic societies, have resigned up to the public the disposing of all their force, so that they cannot employ it against any fellow-citizens any further than the law of the country directs; yet they retain still the power of thinking well or ill, approving or disapproving of the actions of those whom they live amongst, and converse with: and by this approbation and dislike, they establish amongst themselves what they will call virtue and vice.

§11. That this is the common measure of virtue and vice, will appear to any one, who considers, that, though that passes for vice in

one country, which is counted a virtue, or at least not vice in another; yet everywhere, virtue and praise, vice and blame go together. Virtue is everywhere that which is thought praiseworthy; and nothing else but that which has the allowance of public esteem, is called virtue. Virtue and praise are so united, that they are called often by the same name. 'Sunt sua praemia laudi', says Virgil; and so Cicero, 'Nihil habet natura praestantius, quam honestatem, quam laudem, quam dignitatem, quam decus', which he tells you, are all names for the same thing, Tusc. l. 2. This is the language of the heathen philosophers, who well understood wherein their notions of virtue and vice consisted. And though, perhaps, by the different temper, education, fashion, maxims, or interest of different sorts of men, it fell out, that what was thought praiseworthy in one place, escaped not censure in another; and so in different societies, virtues and vices were changed: yet, as to the main, they for the most part kept the same everywhere. For since nothing can be more natural, than to encourage with esteem and reputation that, wherein every one finds his advantage, and to blame and discountenance the contrary; 'tis no wonder, that esteem and discredit, virtue and vice, should in a great measure everywhere correspond with the unchangeable rule of right and wrong, which the law of God hath established; there being nothing that so directly and visibly secures and advances the general good of mankind in this world, as obedience to the laws he has set them, and nothing that breeds such mischiefs and confusion, as the neglect of them. And therefore men, without renouncing all sense and reason, and their own interest, which they are so constantly true to, could not generally mistake, in placing their commendation and blame on that side that really deserved it not. Nay, even those men, whose practice was otherwise, failed not to give their approbation right, few being depraved to that degree as not to condemn, at least in others, the faults they themselves were guilty of: whereby even in the corruption of manners, the true boundaries of the law of nature, which ought to be the rule of virtue and vice, were pretty well preserved. So that even the exhortations of inspired teachers have not feared to appeal to common repute. 'Whatsoever is lovely, whatsoever is of good report, if there be any virtue, if there be any praise,' etc. (Phil. 4. 8.)

§12. Its enforcements, commendation, and discredit. If any one shall imagine that I have forgot my own notion of a law, when I make the law, whereby men judge of virtue and vice, to be nothing else but

the consent of private men, who have not authority enough to make a law: especially wanting that, which is so necessary and essential to a law, a power to enforce it: I think I may say, that he, who imagines commendation and disgrace, not to be strong motives to men, to accommodate themselves to the opinions and rules of those, with whom they converse, seems little skilled in the nature or history of mankind: the greatest part whereof he shall find to govern themselves chiefly, if not solely, by this law of fashion; and so they do that which keeps them in reputation with their company, little regard the laws of God, or the magistrate. The penalties that attend the breach of God's laws, some, nay, perhaps, most men seldom seriously reflect on; and amongst those that do, many, whilst they break the law, entertain thoughts of future reconciliation, and making their peace for such breaches. And as to the punishments due from the laws of the commonwealth, they frequently flatter themselves with the hopes of impunity. But no man escapes the punishment of their censure and dislike, who offends against the fashion and opinion of the company he keeps, and would recommend himself to. Nor is there one of ten thousand, who is stiff and insensible enough to bear up under the constant dislike and condemnation of his own club. He must be of a strange and unusual constitution, who can content himself to live in constant disgrace and disrepute with his own particular society. Solitude many men have sought, and been reconciled to: but nobody that has the least thought or sense of a man about him, can live in society under the constant dislike and ill opinion of his familiars, and those he converses with. This is a burden too heavy for human sufferance: and he must be made up of irreconcilable contradictions, who can take pleasure in company, and yet be insensible of contempt and disgrace from his companions.

§13. These three laws the rules of moral good and evil. These three then, first, the law of God; Secondly, the law of politic societies. Thirdly, the law of fashion, or private censure, are those to which men variously compare their actions: and 'tis by their conformity to one of these laws that they take their measures, when they would judge of their moral rectitude, and denominate their actions good or bad.

§14. Morality is the relation of actions to these rules. Whether the rule to which, as to a touchstone, we bring our voluntary actions, to examine them by, and try their goodness, and accordingly to name

them, which is, as it were, the mark of the value we set upon them: whether, I say, we take that rule from the fashion of the country, or the will of a law-maker, the mind is easily able to observe the relation any action hath to it, and to judge whether the action agrees or disagrees with the rule; and so hath a notion of moral goodness or evil, which is either conformity or not conformity of any action to that rule: and therefore is often called moral rectitude. This rule being nothing but a collection of several simple ideas, the conformity thereto is but so ordering the action, that the simple ideas, belonging to it, may correspond to those which the law requires. And thus we see how moral beings and notions are founded on, and terminated in these simple ideas we have received from sensation or reflection. For example, let us consider the complex idea we signify by the word murder; and when we have taken it asunder, and examined all the particulars, we shall find them to amount to a collection of simple ideas derived from reflection or sensation, viz. first, from reflection on the operations of our own minds, we have the ideas of willing, considering, purposing beforehand, malice, or wishing ill to another; and also of life, or perception, and self-motion. Secondly, from sensation, we have the collection of those simple sensible ideas which are to be found in a man, and of some action, whereby we put an end to perception and motion in the man; all which simple ideas are comprehended in the word murder. This collection of simple ideas being found by me to agree or disagree with the esteem of the country I have been bred in, and to be held by most men there, worthy praise or blame, I call the action virtuous or vicious: if I have the will of a supreme, invisible law-maker for my rule; then, as I supposed the action commanded or forbidden by God, I call it good or evil, sin or duty: and if I compare it to the civil law, the rule made by the legislative of the country, I call it lawful or unlawful, a crime or no crime. So that whencesoever we take the rule of moral actions; or by what standard soever we frame in our minds the ideas of virtues or vices, they consist only, and are made up of collections of simple ideas, which we originally received from sense or reflection, and their rectitude or obliquity consists in the agreement or disagreement with those patterns prescribed by some law.

§15. To conceive rightly of moral actions, we must take notice of them under this twofold consideration. First, as they are in themselves each made up of such a collection of simple ideas. Thus drunkenness, or lying, signify such or such a collection of simple ideas, which I call

mixed modes: and in this sense, they are as much positive absolute ideas, as the drinking of a horse, or speaking of a parrot. Secondly, our actions are considered as good, bad, or indifferent; and in this respect they are relative, it being their conformity to, or disagreement with some rule that makes them to be regular or irregular, good or bad: and so, as far as they are compared with a rule, and thereupon denominated, they come under relation. Thus the challenging and fighting with a man, as 'tis a certain positive mode, or particular sort of action, by particular ideas, distinguished from all others, is called duelling: which, when considered in relation to the law of God, will deserve the name sin; to the law of fashion, in some countries, valour and virtue; and to the municipal laws of some governments, a capital crime. In this case, when the positive mode has one name, and another name as it stands in relation to the law, the distinction may as easily be observed as 'tis in substances, where one name, v.g. man, is used to signify the thing; another, v.g. father, to signify the relation.

§16. The denominations of actions often mislead us. But because very frequently the positive idea of the action, and its moral relation, are comprehended together under one name, and the same word made use of to express both the mode or action, and its moral rectitude or obliquity; therefore the relation itself is less taken notice of; and there is often no distinction made between the positive idea of the action, and the reference it has to a rule. By which confusion of these two distinct considerations under one term, those who yield too easily to the impressions of sounds, and are forward to take names for things, are often misled in their judgment of actions. Thus, the taking from another what is his, without his knowledge or allowance, is properly called stealing: but that name being commonly understood to signify also the moral pravity of the action, and to denote its contrariety to the law, men are apt to condemn whatever they hear called stealing, as an ill action, disagreeing with the rule of right. And yet the private taking away his sword from a madman, to prevent his doing mischief, though it be properly denominated stealing, as the name of such a mixed mode; yet when compared to the law of God, and considered in its relation to that supreme rule, 'tis no sin or transgression, though the name stealing ordinarily carries such an intimation with it.

§17. Relations innumerable. And thus much for the relation of human actions to a law, which, therefore, I call moral relations.

It would make a volume to go over all sorts of relations: 'tis not therefore, to be expected that I should here mention them all. It suffices to our present purpose to show by these, what the ideas are we have of this comprehensive consideration, called relation: Which is so various, and the occasions of it so many, (as many as there can be of comparing things one to another,) that 'tis not very easy to reduce it to rules, or under just heads. Those I have mentioned, I think, are some of the most considerable, and such as may serve to let us see from whence we get our ideas of relations, and wherein they are founded. But before I quit this argument, from what has been said, give me leave to observe.

§18. All relations terminate in simple ideas. First, that 'tis evident, that all relation terminates in, and is ultimately founded on, those simple ideas we have got from sensation or reflection: so that all we have in our thoughts ourselves, (if we think of anything, or have any meaning), or would signify to others, when we use words standing for relations, is nothing but some simple ideas, or collections of simple ideas, compared one with another. This is so manifest in that sort called proportional, that nothing can be more. For when a man says, honey is sweeter than wax, 'tis plain that his thoughts in this relation terminate in this simple idea, sweetness, which is equally true of all the rest; though, where they are compounded, or decompounded, the simple ideas they are made up of, are, perhaps, seldom taken notice of; v.g. when the word father is mentioned: first, there is meant that particular species, or collective idea, signified by the word man; secondly, those sensible simple ideas, signified by the word generation; and, thirdly, the effects of it, and all the simple ideas signified by the word child. So the word friend, being taken for a man who loves and is ready to do good to another, has all these following ideas to the making of it up: First, all the simple ideas, comprehended in the word man, or intelligent being; Secondly, the idea of love; Thirdly, the idea of readiness or disposition; Fourthly, the idea of action, which is any kind of thought or motion; Fifthly, the idea of good, which signifies anything that may advance his happiness, and terminates at last, if examined, in particular simple ideas, of which the word good in general signifies any one, but if removed from all simple ideas quite, it signifies nothing at all. And thus also all moral words terminate at last, though perhaps more remotely, in a collection of simple ideas: the immediate signification of relative words, being very often other supposed known relations; which, if traced one to another,

still end in simple ideas.

§19. We have ordinarily as clear (or clearer) notion of the relation, as of its foundation. Secondly, that in relations, we have for the most part, if not always, as clear a notion for the relation as we have of those simple ideas wherein 'tis founded: agreement or disagreement, whereon relation depends, being things, whereof wess have commonly as clear ideas, as of any other whatsoever; it being but the distinguishing simple ideas, or their degrees one from another, without which we could have no distinct knowledge at all. For if I have a clear idea of sweetness, light, or extension, I have, too, of equal, or more, or less, of each of these: if I know what 'tis for one man to be born of a woman, viz. Sempronia, I know what 'tis for another man to be born of the same woman, Sempronia; and so have as clear a notion of brothers, as of births, and perhaps clearer. For if I believed that Sempronia digged Titus out of the parsley-bed, (as they used to tell children) and thereby became his mother; and that afterwards in the same manner, she digged Caius out of the parsley-bed, I had as clear a notion of the relation of brothers between them, as if I had all the skill of a midwife; the notion that the same woman contributed, as mother, equally to their births, (though I were ignorant or mistaken in the manner of it) being that on which I grounded the relation; and that they agreed in that circumstance of birth, let it be what it will. The comparing them then in their descent from the same person, without knowing the particular circumstances of that descent, is enough to found my notion of their having or not having the relation of brothers. But though the ideas of particular relations are capable of being as clear and distinct in the minds of those who will duly consider them as those of mixed modes, and more determinate than those of substances; yet the names belonging to relation are often of as doubtful and uncertain signification, as those of substances or mixed modes; and much more than those of simple ideas. Because relative words being the marks of this comparison, which is made only by men's thoughts, and is an idea only in men's minds, men frequently apply them to different comparisons of things, according to their own imaginations, which do not always correspond with those of others using the same name.

§20. The notion of relation is the same, whether the rule any action is compared to be true or false. Thirdly, That in these I call moral relations, I have a true notion of relation, by comparing the

action with the rule, whether the rule be true or false. For if I measure anything by a yard, I know whether the thing I measure be longer or shorter than that supposed yard, though perhaps the yard I measure by, be not exactly the standard: which indeed is another inquiry. For though the rule be erroneous, and I mistaken in it; yet the agreement or disagreement observable in that which I compare with it, makes me perceive the relation. Though, measuring by a wrong rule, I shall thereby be brought to judge amiss of its moral rectitude, because I have tried it by that which is not the true rule; but I am not mistaken in the relation which that action bears to that rule I compare it to, which is agreement or disagreement.

Chapter XXIX Of Clear and Obscure, Distinct and Confused Ideas

§1. Ideas, some clear and distinct, others obscure and confused. Having shown the original of our ideas, and taken a view of their several sorts; considered the difference between the simple and the complex, and observed how the complex ones are divided into those of modes, substances, and relations all which, I think, is necessary to be done by any one who would acquaint himself thoroughly with the progress of the mind in its apprehension and knowledge of things; it will, perhaps, be thought I have dwelt long enough upon the examination of ideas. I must nevertheless, crave leave to offer some few other considerations concerning them. The first is, that some are clear and others obscure; some distinct and others confused.

§2. Clear and obscure explained by sight. The perception of the mind being most aptly explained by words relating to the sight, we shall best understand what is meant by clear and obscure in our ideas, by reflecting on what we call clear and obscure in the objects of sight. Light being that which discovers to us visible objects, we give the name of obscure to that which is not placed in a light sufficient to discover minutely to us the figure and colours which are observable in it, and which, in a better light, would be discernible. In like manner our simple ideas are clear, when they are such as the objects themselves from whence they were taken did or might, in a wellordered sensation or perception, present them. Whilst the memory retains them thus, and can produce them to the mind, whenever it has

occasion to consider them, they are clear ideas. So far as they either want anything of that original exactness, or have lost any of their first freshness, and are, as it were, faded or tarnished by time, so far are they obscure. Complex ideas, as they are made up of simple ones, so they are clear, when the ideas that go to their composition are clear, and the number and order of those simple ideas that are the ingredients of any complex one is determinate and certain.

§3. Causes of obscurity. The causes of obscurity, in simple ideas, seem to be either dull organs, or very slight and transient impressions made by the objects; or else a weakness in the memory, not able to retain them as received. For to return again to visible objects, to help us to apprehend this matter: If the organs, or faculties of perception, like wax over-hardened with cold, will not receive the impression of the seal, from the usual impulse wont to imprint it; or, like wax of a temper too soft, will not hold it well when well imprinted; or else supposing the wax of a temper fit, but the seal not applied with a sufficient force to make a clear impression: in any of these cases, the print left by the seal will be obscure. This, I suppose, needs no application to make it plainer.

§4. Distinct and confused, what. As a clear idea is that whereof the mind has such a full and evident perception, as it does receive from an outward object operating duly on a well-disposed organ, so a distinct idea is that wherein the mind perceives a difference from all other; and a confused idea is such an one as is not sufficiently distinguishable from another, from which it ought to be different.

§5. Objection. If no idea be confused, but such as is not sufficiently distinguishable from another, from which it should be different, it will be hard, may anyone say, to find anywhere a confused idea. For, let any idea be as it will, it can be no other but such as the mind perceives it to be; and that very perception sufficiently distinguishes it from all other ideas, which cannot be other, i.e. different, without being perceived to be so. No idea, therefore can be undistinguishable from another, from which it ought to be different, unless you would have it different from itself: for from all other 'tis evidently different.

§6. Confusion of ideas, is in reference to their names. To remove this difficulty, and to help us to conceive aright what 'tis that makes the confusion ideas are at any time chargeable with, we must

consider, that things ranked under distinct names are supposed different enough to be distinguished, that so each sort, by its peculiar name, may be marked and discoursed of apart upon any occasion:and there is nothing more evident, than that the greatest part of different names are supposed to stand for different things. Now every idea a man has, being visibly what 'tis, and distinct from all other ideas but itself, that which makes it confused, is, when 'tis such that it may as well be called by another name, as that which 'tis expressed by, the difference which keeps the things (to be ranked under those two different names) distinct, and makes some of them belong rather to the one and some of them to the other of those names, being left out, and so the distinction, which was intended to be kept up by those different names, is quite lost.

§7. Defaults which make confusion. First, complex ideas made up of too few simple ones. The defaults which usually occasion this confusion,I think, are chiefly these following.

First, when any complex idea (for 'tis complex ideas that are most liable to confusion) is made up of too small a number of simple ideas, and such only as are common to other things, whereby the differences that make it deserve a different name, are left out. Thus he that has an idea made up of barely the simple ones of a beast with spots, has but a confused idea of a leopard, it not being thereby sufficiently distinguished from a lynx, and several other sorts of beasts that are spotted. So that such an idea, though it hath the peculiar name leopard, is not distinguishable from those designed by the names lynx or panther, and may as well come under the name lynx as leopard. How much the custom of defining of words by general terms, contributes to make the ideas we would express by them confused and undetermined, I leave others to consider.This is evident, that confused ideas are such as render the use of words uncertain, and take away the benefit of distinct names. When the ideas, for which we use different terms, have not a difference answerable to their distinct names, and so cannot be distinguished by them, there 'tis that they are truly confused.

§8. Secondly, or its simple ones jumbled disorderly together.Secondly, another fault which makes our ideas confused is, when,though the particulars that make up any idea are in number enough;yet they are so jumbled together, that 'tis not easily

discernible, whether it more belongs to the name that is given it than to any other. There is nothing properer to make us conceive this confusion than a sort of pictures usually shown, as surprising pieces of art, wherein the colours, as they are laid by the pencil on the table itself, mark out very odd and unusual figures, and have no discernible order in their position. This draught, thus made up of parts wherein no symmetry nor order appears, is in itself no more a confused thing, than the picture of a cloudy sky; wherein though there be as little order of colours or figures to be found, yet nobody thinks it a confused picture. What is it then that makes it be thought confused, since the want of symmetry does not? As 'tis plain it does not; for another draught made barely in imitation of this could not be called confused. I answer, that which makes it be thought confused is, the applying it to some name to which it does no more discernibly belong than to some other: V.g. When 'tis said to be the picture of a man, or Caesar, then anyone with reason counts it confused: because 'tis not discernible in that state to belong more to the name man, or Caesar, than to the name baboon, or Pompey; which are supposed to stand for different ideas from those signified by man, or Caesar. But when a cylindrical mirror, placed right, had reduced those irregular lines on the table into their due order and proportion, then the confusion ceases, and the eye presently sees that 'tis a man, or Caesar; i.e. that it belongs to those names; and that 'tis sufficiently distinguishable from a baboon, or Pompey; i.e. from the ideas signified by those names. Just thus 'tis with our ideas, which are as it were the pictures of things. No one of these mental draughts, however the parts are put together, can be called confused (for they are plainly discernible as they are) till it be ranked under some ordinary name to which it cannot be discerned to belong, any more than it does to some other name of an allowed different signification.

§9. Thirdly, or are mutable and undetermined. Thirdly, a third defect that frequently gives the name of confused to our ideas, is, when any one of them is uncertain and undetermined. Thus we may observe men, who not forbearing to use the ordinary words of their language till they have learned their precise signification, change the idea, they make this or that term stand for, almost as often as they use it. He that does this out of uncertainty of what he should leave out, or put into his idea of Church, or idolatry, every time he thinks of either, and holds not steady to any one precise combination of ideas that makes it up, is said to have a confused idea of idolatry or the church: though

this be still for the same reason as the former, viz. because a mutable idea (if we will allow it to be one idea) cannot belong to one name rather than another, and so loses the distinction that distinct names are designed for.

§10. Confusion without reference to names, hardly conceivable. By what has been said, we may observe how much names, as supposed steady signs of things, and by their difference to stand for, and keep things distinct that in themselves are different, are the occasion of denominating ideas distinct or confused, by a secret and unobserved reference the mind makes of its ideas to such names. This perhaps will be fuller understood, after what I say of words in the third Book has been read and considered. But without taking notice of such a reference of ideas to distinct names, as the signs of distinct things, it will be hard to say what a confused idea is. And therefore when a man designs, by any name, a sort of things, or any one particular thing, distinct from all others, the complex idea he annexes to that name is the more distinct, the more particular the ideas are, and the greater and more determinate the number and order of them is, whereof 'tis made up. For the more it has of these, the more it has still of the perceivable differences, whereby 'tis kept separate and distinct from all ideas belonging to other names, even those that approach nearest to it, and thereby all confusion with them is avoided.

§11. Confusion concerns always two ideas. Confusion, making it a difficulty to separate two things that should be separated, concerns always two ideas; and those most which most approach one another. Whenever therefore we suspect any idea to be confused, we must examine what other 'tis in danger to be confounded with, or which it cannot easily be separated from, and that will always be found an idea belonging to another name, and so should be a different thing from which yet 'tis not sufficiently distinct; being either the same with it, or making a part of it, or at least as properly called by that name as the other 'tis ranked under; and so keeps not that difference from that other idea which the different names import.

§12. Causes of confusion. This, I think, is the confusion proper to ideas, which still carries with it a secret reference to names. At least, if there be any other confusion of ideas, this is that which most of all disorders men's thoughts and discourses: ideas, as ranked under

names, being those that for the most part men reason of within themselves, and always those which they commune about with others. And therefore where there are supposed two different ideas, marked by two different names, which are not as distinguishable as the sounds that stand for them, there never fails to be confusion: and where any ideas are distinct as the ideas of those two sounds they are marked by, there can be between them no confusion. The way to prevent 'tis to collect and unite into one complex idea, as precisely as is possible, all those ingredients whereby 'tis differenced from others; and to them so united in a determinate number and order, apply steadily the same name. But this neither accommodating men's ease or vanity, nor serving any design, but that of naked truth, which is not always the thing aimed at, such exactness is rather to be wished than hoped for. And since the loose application of names, to undetermined, variable, and almost no ideas, serves both to cover our own ignorance, as well as to perplex and confound others, which goes for learning and superiority in knowledge, 'tis no wonder that most men should use it themselves, whilst they complain of it in others. Though I think no small part of the confusion to be found in the notions of men, might by care and ingenuity be avoided; yet I am far from concluding it everywhere wilful. Some ideas are so complex, and made up of so many parts, that the memory does not easily retain the very same precise combination of simple ideas under one name; much less are we able constantly to divine for what precise complex idea such a name stands in another man's use of it. From the first of these, follows confusion in a man's own reasonings and opinions within himself; from the latter, frequent confusion in discoursing and arguing with others. But having more at large treated of words, their defects and abuses in the following Book, I shall here say no more of it.

§13. Complex ideas may be distinct in one part, and confused in another. Our complex ideas being made up of collections, and so variety of simple ones may accordingly be very clear and distinct in one part, and very obscure and confused in another. In a man who speaks of a chiliadron, or a body of a thousand sides, the ideas of the figure may be very confused, though that of the number be very distinct; so that he being able to discourse and demonstrate concerning that part of his complex idea which depends upon the number of thousand, he is apt to think he has a distinct idea of a chiliadron; though it be plain he has no precise idea of its figure, so as to distinguish it, by that, from one that has but 999 sides: the not

observing whereof causes no small error in men's thoughts, and confusion in their discourses.

§14. This, if not heeded, causes confusion in our arguings. He that thinks he has a distinct idea of the figure of a chiliadron, let him for trial's sake take another parcel of the same uniform matter, viz. gold or wax of an equal bulk, and make it into a figure of 999 sides. He will, I doubt not, be able to distinguish these two ideas one from another, by the number of sides; and reason and argue distinctly about them, whilst he keeps his thoughts and reasoning to that part only of these ideas which is contained in their numbers; as that the sides of the one could be divided into two equal numbers, and of the other, not, etc. But when he goes about to distinguish them by their figure, he will there be presently at a loss, and not be able, I think, to frame in his mind two ideas, one of them distinct from the other, by the bare figure of these two pieces of gold; as he could, if the same parcels of gold were made one into a cube, the other a figure of five sides. In which incomplete ideas, we are very apt to impose on ourselves, and wrangle with others, especially where they have particular and familiar names. For being satisfied in that part of the idea which we have clear; and the name which is familiar to us, being applied to the whole, containing that part also which is imperfect and obscure, we are apt to use it for that confused part, and draw deductions from it in the obscure part of its signification, as confidently as we do from the other.

§15. Instance in eternity. Having frequently in our mouths the name eternity, we are apt to think we have a positive comprehensive idea of it, which is as much as to say, that there is no part of that duration which is not clearly contained in our idea. 'Tis true that he that thinks so, may have a clear idea of duration; he may also have a very clear idea of a very great length of duration; he may also have a clear idea of the comparison of that great one with still a greater: but it not being possible for him to include in his idea of any duration, let it be as great as it will, the whole extent together of a duration, where he supposes no end, that part of his idea, which is still beyond the bounds of that large duration, he represents to his own thoughts, is very obscure and undetermined. And hence 'tis that in disputes and reasonings concerning eternity, or any other infinite, we are apt to blunder, and involve ourselves in manifest absurdities.

§16. Divisibility of matter. In matter, we have no clear ideas of the smallness of parts much beyond the smallest that occur to any of our senses: and therefore when we talk of the divisibility of matter in infinitum, though we have clear ideas of division and divisibility, and have also clear ideas of parts made out of a whole by division; yet we have but very obscure and confused ideas of corpuscles, or minute bodies so to be divided, when, by former divisions they are reduced to a smallness much exceeding the perception of any of our senses; and so all that we have clear and distinct ideas of, is of what division in general or abstractedly is, and the relation of totum and pars: but of the bulk of the body, to be thus infinitely divided after certain progressions, I think, we have no clear nor distinct idea at all. For I ask anyone, whether taking the smallest atom of dust he ever saw, he has any distinct idea (bating still the number which concerns not extension) betwixt the 100,000 and the 1000,000 part of it. Or if he thinks he can refine his ideas to that degree, without losing sight of them, let him add ten cyphers to each of those numbers. Such a degree of smallness is not unreasonable to be supposed, since a division carried on so far, brings it no nearer the end of infinite division, than the first division into two halves does. I must confess, for my part, I have no clear distinct ideas of the different bulk or extension of those bodies, having but a very obscure one of either of them. So that, I think, when we talk of division of bodies in infinitum, our idea of their distinct bulks, which is the subject and foundation of division, comes, after a little progression, to be confounded, and almost lost in obscurity. For that idea which is to represent only bigness, must be very obscure and confused, which we cannot distinguish from one ten times as big, but only by number; so that we have clear distinct ideas, we may say of ten and one, but no distinct ideas of two such extensions. 'Tis plain from hence, that when we talk of infinite divisibility of body or extension, our distinct and clear ideas are only of numbers: but the clear distinct ideas of extension after some progress of division, is quite lost; and of such minute parts, we have no distinct ideas at all; but it returns, as all our ideas of infinite do, at last to that of number always to be added; but thereby never amounts to any distinct idea of actual infinite parts. We have, 'tis true, a clear idea of division, as often as we think of it; but thereby we have no more a clear idea of infinite parts in matter, than we have a clear idea of an infinite number, by being able still to add new numbers to any assigned number we have: endless divisibility giving us no more a clear and distinct idea of actually infinite parts, than endless addibility

(if I may so speak) gives us a clear and distinct idea of an actually infinite number. They both being only in a power still of increasing the number, be it already as great as it will. So that of what remains to be added (wherein consists the infinity) we have but an obscure, imperfect, and confused idea; from or about which we can argue or reason with no certainty or clearness, no more than we can in arithmetic, about a number of which we have no such distinct idea, as we have of 4 or 100; but only this relative obscure one, that compared to any other, 'tis still bigger: and we have no more a clear positive idea of it, when we say or conceive 'tis bigger, or more than 400,000,000, than if we should say, 'tis bigger than 40 or 4,400,000,000, having no nearer a proportion to the end of addition or number than 4. For he that adds only 4 to 4, and so proceeds, shall as soon come to the end of all addition, as he that adds 400,000,000 to 400,000,000. And so likewise in eternity, he that has an idea of but four years, has as much a positive complete idea of eternity, as he that has one of 400,000,000, of years: for what remains of eternity beyond either of these two numbers of years, is as clear to the one as the other; i.e. neither of them has any clear positive idea of it at all. For he that adds only 4 years to 4, and so on, shall as soon reach eternity as he that adds 400,000,000 of years, and so on; or if he please, doubles the increase as often as he will: the remaining abyss being still as far beyond the end of all these progressions as 'tis from the length of a day or an hour. For nothing finite bears any proportion to infinite; and therefore our ideas, which are all finite, cannot bear any. Thus 'tis also in our idea of extension, when we increase it by addition, as well as when we diminish it by division, and would enlarge our thoughts to infinite space. After a few doublings of those ideas of extension, which are the largest we are accustomed to have, we lose the clear distinct idea of that space: it becomes a confusedly great one, with a surplus of still greater; about which, when we would argue or reason, we shall always find ourselves at a loss; confused ideas, in our arguings and deductions from that part of them which is confused, always leading us into confusion.

Chapter XXX Of Real and Fantastical Ideas

§1. Real ideas are conformable to their archetypes. Besides what we have already mentioned concerning ideas, other considerations belong to them, in reference to things from whence they are taken, or

which they may be supposed to represent; and thus, I think, they may come under a threefold distinction; and are,

First, either real or fantastical;

Secondly, adequate or inadequate;

Thirdly, true or false.

First, by real ideas, I mean such as have a foundation in nature; such as have a conformity with the real being and existence of things, or with their archetypes. Fantastical or chimerical, I call such as have no foundation in nature, nor have any conformity with that reality of being to which they are tacitly referred, as to their archetypes. If we examine the several sorts of ideas before mentioned, we shall find that,

§2. Simple ideas all real. First, Our simple ideas are all real, all agree to the reality of things. Not that they are all of them the images or representations of what does exist, the contrary whereof, in all but the primary qualities of bodies, hath been already showed. But though whiteness and coldness are no more in snow than pain is; yet those ideas of whiteness and coldness, pain, etc., being in us the effects of powers in things without us, ordained by our Maker to produce in us such sensations; they are real ideas in us, whereby we distinguish the qualities that are really in things themselves. For these several appearances being designed to be the marks whereby we are to know and distinguish things which we have to do with, our ideas do as well serve us to that purpose, and are as real distinguishing characters, whether they be only constant effects, or else exact resemblances of something in the things themselves; the reality lying in that steady correspondence they have with the distinct constitutions of real beings. But whether they answer to those constitutions, as to causes or patterns, it matters not; it suffices that they are constantly produced by them. And thus our simple ideas are all real and true, because they answer and agree to those powers of things which produce them in our minds, that being all that is requisite to make them real, and not fictions at pleasure. For in simple ideas (as has been shown) the mind is wholly confined to the operation of things upon it, and can make to itself no simple idea, more than what it has received.

§3. Complex ideas are voluntary combinations. Though the mind

be wholly passive in respect of its simple ideas; Yet, I think, we may say 'tis not so in respect of its complex ideas: For those being combinations of simple ideas put together, and united under one general name; 'tis plain that the mind of man uses some kind of liberty in forming those complex ideas: how else comes it to pass, that one man's idea of gold, or justice, is different from another's? But because he has put in, or left out of his some simple idea which the other has not. The question then is, Which of these are real, and which barely imaginary combinations? What collections agree to the reality of things, and what not? And to this I say that,

§4. Mixed modes made of consistent ideas, are real. Secondly, Mixed modes and relations, having no other reality but what they have in the minds of men, there is nothing more required to those kind of ideas to make them real, but that they be so framed, that there be a possibility of existing conformable to them. These ideas themselves archetypes, cannot differ from their archetypes, and so cannot be chimerical, unless anyone will jumble together in them inconsistent ideas. Indeed, as any of them have the names of a known language assigned to them, by which he that has them in his mind would signify them to others, so bare possibility of existing is not enough; they must have a conformity to the ordinary signification of the name that is given them, that they may not be thought fantastical: as if a man would give the name of justice to that idea which common use calls liberality. But this fantasticalness relates more to propriety of speech, than reality of ideas. For a man to be undisturbed in danger, sedately to consider what is fittest to be done, and to execute it steadily, is a mixed mode, or a complex idea of an action which may exist. But to be undisturbed in danger, without using one's reason or industry, is what is also possible to be; and so is as real an idea as the other. Though the first of these having the name courage given to it, may, in respect of that name, be a right or wrong idea: but the other, whilst it has not a common received name of any known language assigned to it, is not capable of any deformity, being made with no reference to anything but itself.

§5. Ideas of substances are real, when they agree with the existence of things. Thirdly, our complex ideas of substances being made all of them in reference to things existing without us, and intended to be representations of substances as they really are, are no further real, than as they are such combinations of simple ideas as are

really united, and co-exist in things without us. On the contrary, those are fantastical which are made up of such collections of simple ideas as were really never united, never were found together in any substance; v.g. a rational creature, consisting of a horse's head, joined to a body of human shape, or such as the centaurs are described: or, a body, yellow, very malleable, fusible, and fixed; but lighter than common water: or an uniform, unorganized body, consisting, as to sense, all of similar parts, with perception and voluntary motion joined to it. Whether such substances as these can possibly exist or no, 'tis probable we do not know: but be that as it will, these ideas of substances being made conformable to no pattern existing that we know, and consisting of such collections of ideas as no substance ever showed us united together, they ought to pass with us for barely imaginary: but much more are those complex ideas so, which contain in them any inconsistency or contradiction of their parts.

Chapter XXXI Of Adequate and Inadequate Ideas

§1. Adequate ideas, are such as perfectly represent their archetypes. Of our real ideas, some are adequate, and some are inadequate. Those I call adequate, which perfectly represent those archetypes which the mind supposes them taken from; which it intends them to stand for, and to which it refers them. Inadequate ideas are such, which are but a partial or incomplete representation of those archetypes to which they are referred. Upon which account 'tis plain, §2. Simple ideas all adequate First, that all our simple ideas are adequate. Because being nothing but the effects of certain powers in things, fitted and ordained by God to produce such sensations in us, they cannot but be correspondent and adequate to those powers: and we are sure they agree to the reality of things. For if sugar

produce in us the ideas which we call whiteness and sweetness, we are sure there is a power in sugar to produce those ideas in our minds, or else they could not have been produced by it. And so each sensation answering the power that operates on any of our senses, the idea so produced is a real idea, (and not a fiction of the mind, which has no power to produce any simple idea;) and cannot but be adequate, since it ought only to answer that power: and so all simple ideas are adequate. 'Tis true, the things producing in us these simple ideas are but few of them denominated by us, as if they were only the causes of them; but as if those ideas were real beings in them. For though fire be called painful to the touch, whereby is signified the power of producing in us the idea of pain; yet 'tis denominated also light and hot; as if light and heat were really something in the fire, more than a power to excite these ideas in us; and therefore are called qualities in or of the fire. But these being nothing, in truth, but powers to excite such ideas in us, I must in that sense be understood, when I speak of secondary qualities, as being in things; or of their ideas as being the objects that excite them in us. Such ways of speaking, though accommodated to the vulgar notions, without which one cannot be well understood; yet truly signify nothing but those powers which are in things to excite certain sensations or ideas in us. Since were there no fit organs to receive the impressions fire makes on the sight and touch; nor a mind joined to those organs to receive the ideas of light and heat by those impressions from the fire or sun, there would yet be no more light or heat in the world than there would be pain, if there were no sensible creature to feel it, though the sun should continue just as 'tis now, and Mount Aetna flame higher than ever it did. Solidity and extension, and the termination of it, figure, with motion and rest, whereof we have the ideas, would be really in the world as they are, whether there were any sensible being to perceive them or no: and therefore those we have reason to look on, as the real modifications of matter; and such as are the exciting causes of all our various sensations from bodies. But this being an inquiry not belonging to this place, I shall enter no further into it, but proceed to show what complex ideas are adequate, and what not.

§3. Modes are all adequate. Secondly, our complex ideas of modes, being voluntary collections of simple ideas, which the mind puts together, without reference to any real archetypes, or standing patterns, existing anywhere, are and cannot but be adequate ideas. Because they not being intended for copies of things really

existing, but for archetypes made by the mind, to rank and denominate things by, cannot want anything; they having each of them that combination of ideas, and thereby that perfection which the mind intended they should: so that the mind acquiesces in them, and can find nothing wanting. Thus, by having the idea of a figure with three sides meeting at three angles, I have a complete idea, wherein I require nothing else to make it perfect. That the mind is satisfied with the perfection of this its idea, is plain in that it does not conceive that any understanding hath, or can have a more complete or perfect idea of that thing it signifies by the word triangle, supposing it to exist, than itself has in that complex idea of three sides and three angles; in which is contained all that is or can be essential to it, or necessary to complete it, wherever or however it exists. But in our ideas of substances, 'tis otherwise. For there, desiring to copy things as they really do exist, and to represent to ourselves that constitution on which all their properties depend, we perceive our ideas attain not that perfection we intend: we find they still want something we should be glad were in them; and so are all inadequate. But mixed modes and relations, being archetypes without patterns, and so having nothing to represent but themselves, cannot but be adequate, everything being so to itself. He that at first put together the idea of danger perceived, absence of disorder from fear, sedate consideration of what was justly to be done, and executing of that without disturbance, or being deterred by the danger of it, had certainly in his mind that complex idea made up of that combination, and intending it to be nothing else but what is; nor to have in it any other simple ideas but what it hath, it could not also but be an adequate idea: and laying this up in his memory, with the name courage annexed to it, to signify to others, and denominate from thence any action he should observe to agree with it, had thereby a standard to measure and denominate actions by, as they agreed to it. This idea thus made, and laid up for a pattern, must necessarily be adequate, being referred to nothing else but itself, nor made by any other original but the good-liking and will of him that first made this combination.

§4. Modes in reference to settled names, may be inadequate. Indeed another coming after, and in conversation learning from him the word courage, may make an idea, to which he gives that name courage, different from what the first author applied it to, and has in his mind when he uses it. And in this case, if he designs that his idea in thinking should be conformable to the other's idea, as the name he

uses in speaking is conformable in sound to his from whom he learned it, his idea may be very wrong and inadequate. Because in this case, making the other man's idea the pattern of his idea in thinking, as the other man's word or sound is the pattern of his in speaking, his idea is so far defective and inadequate, as 'tis distant from the archetype and pattern he refers it to, and intends to express and signify by the name he uses for it; which name he would have to be a sign of the other man's idea, (to which, in its proper use, 'tis primarily annexed,) and of his own, as agreeing to it: to which if his own does not exactly correspond, 'tis faulty and inadequate.

§5. Therefore these complex ideas of modes, when they are referred by the mind, and intended to correspond to the ideas in the mind of some other intelligent being, expressed by the names we apply to them, they may be very deficient, wrong, and inadequate. Because they agree not to that which the mind designs to be their archetype and pattern: in which respect only any idea of modes can be wrong, imperfect, or inadequate. And on this account our ideas of mixed modes are the most liable to be faulty of any other; but this refers more to proper speaking than knowing right.

§6. Ideas of substances, as referred to real essences, not adequate. Thirdly, what ideas we have of substances, I have above shown: now, those ideas have in the mind a double reference: 1. Sometimes they are referred to a supposed real essence of each species of things. 2. Sometimes they are only designed to be pictures and representations in the mind of things that do exist, by ideas of those qualities that are discoverable in them. In both which ways these copies of those originals and archetypes are imperfect and inadequate.

First, 'tis usual for men to make the names of substances stand for things, as supposed to have certain real essences, whereby they are of this or that species: and names standing for nothing but the ideas that are in men's minds, they must constantly refer their ideas to such real essences, as to their archetypes. That men (especially such as have been bred up in the learning taught in this part of the world) do suppose certain specific essences of substances, which each individual in its several kinds is made conformable to and partakes of, is so far from needing proof that it will be thought strange if any one should do otherwise. And thus they ordinarily apply the specific names they rank particular substances under, to things as distinguished by such

specific real essences. Who is there almost, who would not take it amiss, if it should be doubted whether he called himself a man, with any other meaning than as having the real essence of a man' And yet if you demand what those real essences are, 'tis plain men are ignorant, and know them not. From whence it follows, that the ideas they have in their minds, being referred to real essences, as to archetypes which are unknown, must be so far from being adequate that they cannot be supposed to be any representation of them at all. The complex ideas we have of substances are, as it has been shown, certain collections of simple ideas that have been observed or supposed constantly to exist together. But such a complex idea cannot be the real essence of any substance; for then the properties we discover in that body would depend on that complex idea, and be deducible from it, and their necessary connexion with it be known; as all properties of a triangle depend on, and, as far as they are discoverable, are deducible from the complex idea of three lines including a space. But 'tis plain that in our complex ideas of substances are not contained such ideas, on which all the other qualities that are to be found in them do depend. The common idea men have of iron, is a body of a certain colour, weight, and hardness; and a property that they look on as belonging to it, is malleableness. But yet this property has no necessary connexion with that complex idea, or any part of it: and there is no more reason to think that malleableness depends on that colour, weight, and hardness, than that colour or that weight depends on its malleableness. And yet, though we know nothing of these real essences, there is nothing more ordinary than that men should attribute the sorts of things to such essences. The particular parcel of matter which makes the ring I have on my finger is forwardly by most men supposed to have a real essence, whereby 'tis gold; and from whence those qualities flow which I find in it, viz. its peculiar colour, weight, hardness, fusibility, fixedness, and change of colour upon a slight touch of mercury, etc. This essence, from which all these properties flow, when I inquire into it and search after it, I plainly perceive I cannot discover: the furthest I can go, is only to presume, that it being nothing but body, its real essence or internal constitution, on which these qualities depend, can be nothing but the figure, size, and connexion of its solid parts; of neither of which, I having any distinct perception at all, I can have no idea of its essence, which is the cause that it has that particular shining yellowness; a greater weight than anything I know of the same bulk, and a fitness to have its colour changed by the touch of

quicksilver. If any one will say, that the real essence and internal constitution, on which these properties depend, is not the figure, size, and arrangement or connexion of its solid parts, but something else, called its particular form; I am further from having any idea of its real essence than I was before; for I have an idea of figure, size, and situation of solid parts in general, though I have none of the particular figure, size, or putting together of parts, whereby the qualities above mentioned are produced; which qualities I find in that particular parcel of matter that is on my finger, and not in another parcel of matter, with which I cut the pen I write with. But when I am told that something besides the figure, size, and posture of the solid parts of that body is its essence, something called substantial form; of that I confess I have no idea at all, but only of the sound form; which is far enough from an idea of its real essence or constitution. The like ignorance as I have of the real essence of this particular substance, I have also of the real essence of all other natural ones: of which essences I confess I have no distinct ideas at all; and I am apt to suppose others, when they examine their own knowledge, will find in themselves, in this one point, the same sort of ignorance.

§7. Because men know not the real essences of substances. Now, then, when men apply to this particular parcel of matter on my finger, a general name already in use, and denominate it gold, do they not ordinarily, or are they not understood to give it that name as belonging to a particular species of bodies, having a real internal essence; by having of which essence, this particular substance comes to be of that species, and to be called by that name? If it be so, as 'tis plain 'tis, the name by which things are marked as having that essence must be referred primarily to that essence; and consequently the idea to which that name is given must be referred also to that essence, and be intended to represent it. Which essence, since they who so use the names know not, their ideas of substances must be all inadequate in that respect, as not containing in them that real essence which the mind intends they should.

§8. Ideas of substances, as collections of their qualities, are all inadequate. Secondly, those who neglecting that useless supposition of unknown real essences, whereby they are distinguished, endeavour to copy the substances that exist in the world, by putting together the ideas of those sensible qualities which are found co-existing in them, though they come much nearer a likeness of them than those who

imagine they know not what real specific essences: yet they arrive not at perfectly adequate ideas of those substances they would thus copy into the their minds; nor do those copies exactly and fully contain all that is to be found in their archetypes. Because those qualities and powers of substances, whereof we make their complex ideas, are so many and various, that no man's complex idea contains them all. That our complex ideas of substances do not contain in them all the simple ideas that are united in the things themselves is evident, in that men do rarely put into their complex idea of any substance, all the simple ideas they do know to exist in it. Because, endeavouring to make the signification of their names as clear and as little cumbersome as they can, they make their specific ideas of the sorts of substance, for the most part, of a few of those simple ideas which are to be found in them: but these having no original precedency, or right to be put in, and make the specific idea, more than others that are left out, 'tis plain that both these ways, our ideas of substances are deficient and inadequate. The simple ideas whereof we make our complex ones of substances are all of them (bating only the figure and bulk of some sorts) powers, which being relations to other substances, we can never be sure that we know all the powers that are in any one body, till we have tried what changes 'tis fitted to give to or receive from other substances in their several ways of application: which being impossible to be tried upon any one body, much less upon all, 'tis impossible we should have adequate ideas of any substance made up of a collection of all its properties.

§9. Whosoever first light on a parcel of that sort of substance we denote by the word gold, could not rationally take the bulk and figure he observed in that lump to depend on its real essence or internal constitution. Therefore those never went into his idea of that species of body; but its peculiar colour, perhaps, and weight, were the first he abstracted from it, to make the complex idea of that species. Which both are but powers; the one to affect our eyes after such a manner, and to produce in us that idea we call yellow; and the other to force upwards any other body of equal bulk, they being put into a pair of equal scales, one against another. Another perhaps added to these the ideas of fusibility and fixedness, two other passive powers, in relation to the operation of fire upon it; another, its ductility and solubility in aqua regia, two other powers, relating to the operation of other bodies, in changing its outward figure, or separation of it into insensible parts. These, or parts of these, put together, usually make

the complex idea in men's minds of that sort of body we call gold.

§10. But no one, who hath considered the properties of bodies in general, or this sort in particular, can doubt, that this, called gold, has infinite other properties not contained in that complex idea. Some who have examined this species more accurately could, I believe, enumerate ten times as many properties in gold, all of them as inseparable from its internal constitution, as its colour or weight: and 'tis probable, if any one knew all the properties that are by divers men known of this metal, there would be an hundred times as many ideas go to the complex idea of gold, as any one man yet has in his; and yet perhaps that not be the thousandth part of what is to be discovered in it. The changes that that one body is apt to receive, and make in other bodies, upon a due application, exceeding far not only what we know, but what we are apt to imagine. Which will not appear so much a paradox to any one who will but consider how far men are yet from knowing all the properties of that one, no very compound figure, a triangle; though it be no small number that are already by mathematicians discovered of it.

§11. So that all our complex ideas of substances are imperfect and inadequate. Which would be so also in mathematical figures, if we were to have our complex ideas of them, only by collecting their properties in reference to other figures. How uncertain and imperfect would our ideas be of an ellipse, if we had no other idea of it, but some few of its properties? Whereas having in our plain idea the whole essence of that figure, we from thence discover those properties, and demonstratively see how they flow, and are inseparable from it.

§12. Simple ideas, εἰκῶνα, and adequate. Thus the mind has three sorts of abstract ideas or nominal essences: First, simple ideas, which are εἰκῶνων or copies; but yet certainly adequate. Because being intended to express nothing but the power in things to produce in the mind such a sensation, that sensation when 'tis produced, cannot but be the effect of that power. So the paper I write on, having the power in the light (I speak according to the common notion of light) to produce in me the sensation which I call white, it cannot but be the effect of such a power in something without the mind; since the mind has not the power to produce any such idea in itself: and being meant for nothing else but the effect of such a power, that simple idea is real and adequate; the sensation of white, in my mind, being the

effect of that power which is in the paper to produce it, is perfectly adequate to that power; or else that power would produce a different idea.

§13. Ideas of substances are εἴκτυπα, inadequate. Secondly, the complex ideas of substances are ectypes, copies too; but not perfect ones, not adequate: which is very evident to the mind, in that it plainly perceives, that whatever collection of simple ideas it makes of any substance that exists, it cannot be sure that it exactly answers all that are in that substance: since, not having tried all the operations of all other substances upon it, and found all the alterations it would receive from, or cause in, other substances, it cannot have an exact adequate collection of all its active and passive capacities; and so not have an adequate complex idea of the powers of any substance existing, and its relations, which is that sort of complex idea of substances we have. And, after all, if we would have, and actually had, in our complex idea, an exact collection of all the secondary qualities or powers of any substance, we should not yet thereby have an idea of the essence of that thing. For, since the powers or qualities that are observable by us are not the real essence of that substance, but depend on it, and flow from it, any collection whatsoever of these qualities cannot be the real essence of that thing. Whereby 'tis plain, that our ideas of substances are not adequate; are not what the mind intends them to be. Besides, a man has no idea of substance in general, nor knows what substance is in itself.

§14. Ideas of modes and relations, are archetypes, and cannot but be adequate. Thirdly, complex ideas of modes and relations are originals, and archetypes; are not copies, nor made after the pattern of any real existence, to which the mind intends them to be conformable, and exactly to answer. These being such collections of simple ideas that the mind itself puts together, and such collections that each of them contains in it precisely all that the mind intends it should, they are archetypes and essences of modes that may exist; and so are designed only for, and belong only to such modes, as when they do exist, have an exact conformity with those complex ideas. The ideas, therefore of modes and relations cannot but be adequate.

Chapter XXXII Of True and False Ideas

§1. Truth and falsehood properly belong to propositions not to

ideas. Though truth and falsehood belong, in propriety of speech, only to propositions: yet ideas are oftentimes termed true or false, (as what words are there that are not used with great latitude, and with some deviation from their strict and proper significations') Though I think that when ideas themselves are termed true or false, there is still some secret or tacit proposition, which is the foundation of that denomination: as we shall see, if we examine the particular occasions wherein they come to be called true or false. In all which we shall find some kind of affirmation or negation, which is the reason of that denomination. For our ideas, being nothing but bare appearances or perceptions in our minds, cannot properly and simply in themselves be said to be true or false, no more than a single name of anything can be said to be true or false.

§2. Metaphysical truth contains a tacit proposition. Indeed, both ideas and words may be said to be true in a metaphysical sense of the word truth, as all other things that any way exist are said to be true; i.e. really to be such as they exist. Though in things called true, even in that sense, there is perhaps a secret reference to our ideas, looked upon as the standards of that truth, which amounts to a mental proposition, though it be usually not taken notice of.

§3. No idea, as an appearance in the mind, true or false. But 'tis not in that metaphysical sense of truth which we inquire here, when we examine, whether our ideas are capable of being true or false, but in the more ordinary acceptation of those words: and so I say that the ideas in our minds, being only so many perceptions or appearances there, none of them are false. The idea of a centaur having no more falsehood in it when it appears in our minds, than the name centaur has falsehood in it, when 'tis pronounced by our mouths, or written on paper. For truth or falsehood lying always in some affirmation or negation, mental or verbal, our ideas are not capable, any of them, of being false, till the mind passes some judgment on them; that is, affirms or denies something of them.

§4. Ideas referred to anything, may be true or false. Whenever the mind refers any of its ideas to anything extraneous to them, they are then capable to be called true or false. Because the mind in such a reference, makes a tacit supposition of their conformity to that thing; which supposition, as it happens to be true or false; so the ideas themselves come to be denominated. The most usual cases wherein

this happens, are these following:

§5. Other men's ideas; real existence, and supposed real essences, are what men usually refer their ideas to. First, when the mind supposes any idea it has conformable to that in other men's minds, called by the same common name; v.g. when the mind intends or judges its ideas of justice, temperance, religion, to be the same with what other men give those names to.

Secondly, when the mind supposes any idea it has in itself to be conformable to some real existence. Thus the two ideas of a man and a centaur, supposed to be the ideas of real substances, are the one true and the other false; the one having a conformity to what has really existed, the other not.

Thirdly, when the mind refers any of its ideas to that real constitution and essence of anything, whereon all its properties depend: and thus the greatest part, if not all our ideas of substances, are false.

§6. The cause of such references. These suppositions the mind is very apt tacitly to make concerning its own ideas. But yet, if we will examine it, we shall find 'tis chiefly, if not only, concerning its abstract complex ideas. For the natural tendency of the mind being towards knowledge; and finding that, if it should proceed by and dwell upon only particular things, its progress would be very slow, and its work endless: Therefore to shorten its way to knowledge, and make each perception more comprehensive, the first thing it does, as the foundation of the easier enlarging its knowledge, either by contemplation of the things themselves that it would know, or conference with others about them, is to bind them into bundles, and rank them so into sorts, that what knowledge it gets of any of them, it may thereby with assurance extend to all of that sort; and so advance by larger steps in that which is its great business, knowledge. This, as I have elsewhere shown, is the reason why we collect things under comprehensive ideas, with names annexed to them, into genera and species; i.e. into kinds and sorts.

§7. Names of things supposed to carry in them knowledge of their essences. If therefore we will warily attend to the motions of the mind, and observe what course it usually takes in its way to knowledge, we shall, I think find, that the mind having got any idea which it thinks

it may have use of either in contemplation or discourse, the first thing it does is to abstract it, and then get a name to it; and so lay it up in its storehouse, the memory, as containing the essence of a sort of things, of which that name is always to be the mark. Hence 'tis, that we may often observe, that when any one sees a new thing of a kind that he knows not, he presently asks what 'tis; meaning by that inquiry nothing but the name. As if the name carried with it the knowledge of the species, or the essence of it, whereof 'tis indeed used as the mark, and is generally supposed annexed to it.

§8. How men suppose that their ideas must correspond to things, and to the customary meanings of names. But this abstract idea being something in the mind between the thing that exists, and the name that is given to it; 'tis in our ideas that both the rightness of our knowledge, and the propriety and intelligibleness of our speaking, consists. And hence 'tis that men are so forward to suppose, that the abstract ideas they have in their minds are such as agree to the things existing without them, to which they are referred; and are the same also to which the names they give them do by the use and propriety of that language belong. For without this double conformity of their ideas, they find they should both think amiss of things in themselves, and talk of them unintelligibly to others.

§9. Simple ideas may be false, in reference to others of the same name, but are least liable to be so. First then, I say, that when the truth of our ideas is judged of by the conformity they have to the ideas which other men have, and commonly signify by the same name, they may be any of them false. But yet simple ideas are least of all liable to be so mistaken. Because a man by his senses and every day's observation, may easily satisfy himself what the simple ideas are, which their several names that are in common use stand for, they being but few in number, and such, as if he doubts or mistakes in, he may easily rectify by the objects they are to be found in. Therefore 'tis seldom that any one mistakes in his names of simple ideas; or applies the name red to the idea green, or the name sweet to the idea bitter: much less are men apt to confound the names of ideas belonging to different senses, and call a colour by the name of a taste, etc. Whereby 'tis evident that the simple ideas they call by any name are commonly the same that others have and mean when they use the same names.

§10. Ideas of mixed most liable to be false in this sense. Complex

ideas are much more liable to be false in this respect; and the complex ideas of mixed modes, much more than those of substances: because in substances (especially those which the common and unborrowed names of any language are applied to) some remarkable sensible qualities, serving ordinarily to distinguish one sort from another, easily preserve those who take any care in the use of their words, from applying them to sorts of substances to which they do not at all belong. But in mixed modes we are much more uncertain, it being not so easy to determine of several actions, whether they are to be called justice or cruelty, liberality or prodigality. And so in referring our ideas to those of other men, called by the same names, ours may be false; and the idea in our minds, which we express by the word justice, may, perhaps be that which ought to have another name.

§11. Or at least to be thought false. But whether or no our ideas of mixed modes are more liable than any sort to be different from those of other men, which are marked by the same names; this at least is certain, that this sort of falsehood is much more familiarly attributed to our ideas of mixed modes than to any other. When a man is thought to have a false idea of justice, or gratitude, or glory, 'tis for no other reason, but that his agrees not with the ideas which each of those names are the signs of in other men.

§12. And why. The reason whereof seems to me to be this, That the abstract ideas of mixed modes, being men's voluntary combinations of such a precise collection of simple ideas, and so the essence of each species being made by men alone, whereof we have no other sensible standard existing anywhere but the name itself, or the definition of that name: we having nothing else to refer these our ideas of mixed modes to, as a standard to which we would conform them, but the ideas of those who are thought to use those names in their most proper significations; and so, as our ideas conform or differ from them, they pass for true or false. And thus much concerning the truth and falsehood of our ideas, in reference to their names.

§13. As referred to real existence, none of our ideas can be false, but those of substances. Secondly, as to the truth and falsehood of our ideas, in reference to the real existence of things, when that is made the standard of their truth, none of them can be termed false but only our complex ideas of substances.

§14. First, Simple ideas in this sense not false, and why. First, our

simple ideas being barely such perceptions as God has fitted us to receive, and given power to external objects to produce in us by established laws and ways, suitable to his wisdom and goodness, though incomprehensible to us, their truth consists in nothing else but in such appearances as are produced in us, and must be suitable to those powers he has placed in external objects or else they could not be produced in us: and thus answering those powers, they are what they should be, true ideas. Nor do they become liable to any imputation of falsehood, if the mind (as in most men I believe it does) judges these ideas to be in the things themselves. For God in his wisdom having set them as marks of distinction in things, whereby we may be able to discern one thing from another, and so choose any of them for our uses as we have occasion, it alters not the nature of our simple idea, whether we think that the idea of blue be in the violet itself, or in our mind only; and only the power of producing it by the texture of its parts, reflecting the particles of light after a certain manner, to be in the violet itself. For that texture in the object, by a regular and constant operation producing the same idea of blue in us, it serves us to distinguish, by our eyes, that from any other thing; whether that distinguishing mark, as 'tis really in the violet, be only a peculiar texture of parts, or else that very colour, the idea whereof (which is in us) is the exact resemblance. And 'tis equally from that appearance to be denominated blue, whether it be that real colour, or only a peculiar texture in it, that causes in us that idea: since the name blue notes properly nothing but that mark of distinction that is in a violet, discernible only by our eyes, whatever it consists in, that being beyond our capacities distinctly to know, and perhaps would be of less use to us, if we had faculties to discern.

§15. Though one man's idea of blue should be different from another's. Neither would it carry any imputation of falsehood to our simple ideas, if by the different structure of our organs it were so ordered, that the same object should produce in several men's minds different ideas at the same time; v.g. if the idea that a violet produced in one man's mind by his eyes were the same that a marigold produced in another man's, and vice versa. For, since this could never be known; because one man's mind could not pass into another man's body, to perceive what appearances were produced by those organs; neither the ideas hereby, nor the names would be at all confounded, or any falsehood be in either. For all things that had the texture of a violet, producing constantly the idea which he called blue, and those

which had the texture of a marigold, producing constantly the idea which he as constantly called yellow, whatever those appearances were in his mind, he would be able as regularly to distinguish things for his use by those appearances, and understand and signify those distinctions marked by the name blue and yellow, as if the appearances or ideas in his mind received from those two flowers were exactly the same with the ideas in other men's minds. I am nevertheless very apt to think that the sensible ideas produced by any object in different men's minds, are most commonly very near and undiscernibly alike. For which opinion, I think, there might be many reasons offered: but that being besides my present business, I shall not trouble my reader with them; but only mind him, that the contrary supposition, if it could be proved, is of little use, either for the improvement of our knowledge, or conveniency of life, and so we need not trouble ourselves to examine it.

§16. First, Simple ideas in this sense not false, and why. From what has been said concerning our simple ideas, I think it evident that our simple ideas can none of them be false in respect of things existing without us. For the truth of these appearances or perceptions in our minds consisting, as has been said, only in their being answerable to the powers in external objects to produce by our senses such appearances in us, and each of them being in the mind such as 'tis, suitable to the power that produced it, and which alone it represents, it cannot upon that account, or as referred to such a pattern, be false. Blue and yellow, bitter or sweet, can never be false ideas, these perceptions in the mind are just such as they are there, answering the powers appointed by God to produce them; and so are truly what they are, and are intended to be. Indeed the names may be misapplied, but that in this respect makes no falsehood in the ideas: as if a man ignorant in the English tongue should call purple scarlet.

§17. Secondly, modes not false. Secondly, neither can our complex ideas of modes, in reference to the essence of anything really existing, be false. Because whatever complex ideas I have of any mode, it hath no reference to any pattern existing, and made by nature: 'tis not supposed to contain in it any other ideas than what it hath; nor to represent anything but such a complication of ideas as it does. Thus when I have the idea of such an action of a man who forbears to afford himself such meat, drink, and clothing, and other conveniences of life, as his riches and estate will be sufficient to supply and his

station requires, I have no false idea; but such an one as represents an action, either as I find or imagine it, and so is capable of neither truth nor falsehood. But when I give the name frugality or virtue to this action, then it may be called a false idea, if thereby it be supposed to agree with that idea to which, in propriety of speech, the name of frugality doth belong, or to be conformable to that law which is the standard of virtue and vice.

§18. Thirdly ideas of substances when false. Thirdly, our complex ideas of substances, being all referred to patterns in things themselves, may be false. That they are all false, when looked upon as the representations of the unknown essences of things, is so evident that there needs nothing to be said of it. I shall therefore pass over that chimerical supposition, and consider them as collections of simple ideas in the mind, taken from combinations of simple ideas existing together constantly in things, of which patterns they are the supposed copies: and in this reference of them to the existence of things, they are false ideas: 1. When they put together simple ideas, which in the real existence of things have no union; as when to the shape and size that exist together in a horse, is joined in the same complex idea the power of barking like a dog: which three ideas, however put together into one in the mind, were never united in nature; and this therefore may be called a false idea of a horse. 2. Ideas of substances are, in this respect, also false, when, from any collection of simple ideas that do always exist together, there is separated, by a direct negation, any other simple idea which is constantly joined with them. Thus if to extension, solidity, fusibility, the peculiar weightiness, and yellow colour of gold, any one join in his thoughts the negation of a greater degree of fixedness than is in lead or copper, he may be said to have a false complex idea, as well as when he joins to those other simple ones the idea of perfect absolute fixedness. For either way, the complex idea of gold being made up of such simple ones as have no union in nature, may be termed false. But if he leave out of this his complex idea that of fixedness quite, without either actually joining to or separating of it from the rest in his mind, 'tis, I think, to be looked on as an inadequate and imperfect idea, rather than a false one; since though it contains not all the simple ideas that are united in nature, yet it puts none together but what do really exist together.

§19. Truth or falsehood always supposes affirmation or negation. Though in compliance with the ordinary way of speaking, I

have showed in what sense and upon what ground our ideas may be sometimes called true or false; yet if we will look a little nearer into the matter, in all cases where any idea is called true or false, 'tis from some judgment that the mind makes, or is supposed to make, that is true or false. For truth or falsehood, being never without some affirmation or negation, express or tacit, 'tis not to be found but where signs are joined or separated, according to the agreement or disagreement of the things they stand for. The signs we chiefly use are either ideas or words; wherewith we make either mental or verbal propositions. Truth lies in so joining or separating these representatives, as the things they stand for do in themselves agree or disagree; and falsehood in the contrary, as shall be more fully shown hereafter.

§20. Ideas in themselves neither true nor false. Any idea then which we have in our minds, whether conformable or not to the existence of things, or to any idea in the minds of other men, cannot properly for this alone be called false. For these representations, if they have nothing in them but what is really existing in things without, cannot be thought false, being exact representations of something: nor yet if they have anything in them differing from the reality of things, can they properly be said to be false representations, or ideas of things they do not represent. But the mistake and falsehood is,

§21. But are false, first, when judged agreeable to another man's idea without being so. First, when the mind having any idea, it judges and concludes it the same that is in other men's minds, signified by the same name; or that 'tis conformable to the ordinary received signification or definition of that word, when indeed 'tis not: which is the most usual mistake in mixed modes, though other ideas also are liable to it.

§22. Secondly, When judged to agree to real existence, when they do not. Secondly, when it having a complex idea made up of such a collection of simple ones as nature never puts together, it judges it to agree to a species of creatures really existing; as when it joins the weight of tin to the colour, fusibility, and fixedness of gold.

§23. Thirdly, When judged adequate, without being so. Thirdly, when in its complex idea, it has united a certain number of simple ideas that do really exist together in some sort of creatures, but has also left out others as much inseparable, it judges this to be a

perfect complete idea of a sort of things which really 'tis not; v.g. having joined the ideas of substance, yellow, malleable, most heavy, and fusible, it takes that complex idea to be the complete idea of gold, when yet its peculiar fixedness and solubility in aqua regia, are as inseparable from those other ideas or qualities of that body as they are one from another.

§24. Fourthly, When judged to represent the real essence. Fourthly, the mistake is yet greater, when I judge that this complex idea contains in it the real essence of any body existing; when at least it contains but some few of those properties which flow from its real essence and constitution. I say only some few of those properties; for those properties consisting mostly in the active and passive powers it has in reference to other things, all that are vulgarly known of any one body, and of which the complex idea of that kind of things is usually made, are but a very few, in comparison of what a man that has several ways tried and examined it knows of that one sort of things; and all that the most expert man knows are but a few, in comparison of what are really in that body, and depend on its internal or essential constitution. The essence of a triangle lies in a very little compass, consists in a very few ideas: three lines including a space make up that essence: but the properties that flow from this essence are more than can be easily known or enumerated. So I imagine 'tis in substances, their real essences lie in a little compass; though the properties flowing from that internal constitution are endless.

§25. Ideas when false. To conclude, a man having no notion of anything without him, but by the idea he has of it in his mind, (which idea he has a power to call by what name he pleases), he may indeed make an idea neither answering the reason of things, nor agreeing to the idea commonly signified by other people's words; but cannot make a wrong or false idea of a thing which is no otherwise known to him but by the idea he has of it. V.g. when I frame an idea of the legs, arms, and body of a man, and join to this a horse's head and neck, I do not make a false idea of anything; because it represents nothing without me. But when I call it a man or Tartar, and imagine it either to represent some real being without me, or to be the same idea that others call by the same name; in either of these cases I may err. And upon this account 'tis that it comes to be termed a false idea; though indeed the falsehood lies not in the idea, but in that tacit mental proposition, wherein a conformity and resemblance is attributed to it

which it has not. But yet, if having framed such an idea in my mind without thinking either that existence, or the name man or Tartar, belongs to it, I will call it man or Tartar, I may be justly thought fantastical in the naming; but not erroneous in my judgment; nor the idea any way false.

§26. More properly to be called right or wrong. Upon the whole matter, I think that our ideas, as they are considered by the mind, either in reference to the proper signification of their names; or in reference to the reality of things, may very fitly be called right or wrong ideas, according as they agree or disagree to those patterns to which they are referred. But if any one had rather call them true or false, 'tis fit he use a liberty, which every one has, to call things by those names he thinks best; though in propriety of speech, truth or falsehood will, I think, scarce agree to them, but as they, some way or other, virtually contain in them some mental proposition. The ideas that are in a man's mind, simply considered, cannot be wrong, unless complex ones, wherein inconsistent parts are jumbled together. All other ideas are in themselves right, and the knowledge about them right and true knowledge: but when we come to refer them to anything, as to their patterns and archetypes, then they are capable of being wrong, as far as they disagree with such archetypes.

Chapter XXXIII Of the Association of Ideas

§1. Something unreasonable in most men. There is scarce any one that does not observe something that seems odd to him, and is in itself really extravagant in the opinions, reasonings, and actions of other men. The least flaw of this kind, if at all different from his own, every one is quick-sighted enough to espy in another, and will by the authority of reason forwardly condemn, though he be guilty of much greater unreasonableness in his own tenets and conduct, which he never perceives, and will very hardly, if at all, be convinced of.

§2. Not wholly from self-love. This proceeds not wholly from selflove, though that has often a great hand in it. Men of fair minds, and not given up to the overweening of selfflattery, are frequently guilty of it; and in many cases one with amazement hears the arguings, and is astonished at the obstinacy of a worthy man, who yields not to the evidence of reason, though laid before him as clear as daylight.

§3. Nor from education. This sort of unreasonableness is usually imputed to education and prejudice, and for the most part truly enough, though that reaches not the bottom of the disease, nor shows distinctly enough whence it rises, or wherein it lies. Education is often rightly assigned for the cause, and prejudice is a good general name for the thing itself: but yet, I think, he ought to look a little further, who would trace this sort of madness to the root it springs from, and so explain it, as to show whence this flaw has its original in very sober and rational minds, and wherein it consists.

§4. A degree of madness. I shall be pardoned for calling it by so harsh a name as madness, when 'tis considered that opposition to reason deserves that name, and is really madness; and there is scarce a man so free from it, but that if he should always, on all occasions, argue or do as in some cases he constantly does, would not be thought fitter for Bedlam than civil conversation. I do not here mean when he is under the power of an unruly passion, but in the steady calm course of his life. That which will yet more apologize for this harsh name, and ungrateful imputation on the greatest part of mankind is, that, inquiring a little by the bye into the nature of madness (B. 2. c. II. § 13), I found it to spring from the very same root, and to depend on the very same cause we are here speaking of. This consideration of the thing itself, at a time when I thought not the least on the subject which I am now treating of, suggested it to me. And if this be a weakness to which all men are so liable, if this be a taint which so universally infects mankind, the greater care should be taken to lay it open under its due name, thereby to excite the greater care in its prevention and cure.

§5. From a wrong connexion of ideas. Some of our ideas have a natural correspondence and connexion one with another: 'tis the office and excellency of our reason to trace these, and hold them together in that union and correspondence which is founded in their peculiar beings. Besides this, there is another connexion of ideas wholly owing to chance or custom; ideas that in themselves are not all of kin, come to be so united in some men's minds, that 'tis very hard to separate them, they always keep in company, and the one no sooner at any time comes into the understanding, but its associate appears with it; and if they are more than two which are thus united, the whole gang, always inseparable, show themselves together.

§6. This connexion how made. This strong combination of ideas, not allied by nature, the mind makes in itself either voluntarily or by chance; and hence it comes in different men to be very different, according to their different inclinations, education, interests, etc. Custom settles habits of thinking in the understanding, as well as of determining in the will, and of motions in the body; all which seems to be but trains of motions in the animal spirits, which once set a going, continue in the same steps they have used to, which by often treading, are worn into a smooth path, and the motion in it becomes easy, and as it were natural. As far as we can comprehend thinking, thus ideas seem to be produced in our minds; or if they are not, this may serve to explain their following one another in an habitual train, when once they are put into their track, as well as it does to explain such motions of the body. A musician used to any tune will find that, let it but once begin in his head, the ideas of the several notes of it will follow one another orderly in his understanding, without any care or attention, as regularly as his fingers move orderly over the keys of the organ to play out the tune he has begun, though his unattentive thoughts be elsewhere a wandering. Whether the natural cause of these ideas, as well as of that regular dancing of his fingers be the motion of his animal spirits, I will not determine, how probable soever, by this instance, it appears to be so: but this may help us a little to conceive of intellectual habits, and of the tying together of ideas.

§7. Some antipathies an effect of it. That there are such associations of them made by custom in the minds of most men, I think nobody will question, who has well considered himself or others; and to this, perhaps, might be justly attributed most of the sympathies and antipathies observable in men, which work as strongly, and produce as regular effects as if they were natural, and are therefore called so, though they at first had no other original but the accidental connexion of two ideas, which either the strength of the first impression, or future indulgence so united, that they always afterwards kept company together in that man's mind, as if they were but one idea. I say most of the antipathies, I do not say all, for some of them are truly natural, depend upon our original constitution, and are born with us; but a great part of those which are counted natural, would have been known to be from unheeded, though perhaps early impressions, or wanton fancies at first, which would have been acknowledged the original of them, if they had been warily observed. A grown person

surfeiting with honey no sooner hears the name of it, but his fancy immediately carries sickness and qualms to his stomach, and he cannot bear the very idea of it; other ideas of dislike, and sickness, and vomiting, presently accompany it, and he is disturbed, but he knows from whence to date this weakness, and can tell how he got this indisposition: had this happened to him by an overdose of honey when a child, all the same effects would have followed, but the cause would have been mistaken, and the antipathy counted natural.

§8. Influence of association to be watched educating young children. I mention this not out of any great necessity there is in this present argument to distinguish nicely between natural and acquired antipathies, but I take notice of it for another purpose, viz. that those who have children, or the charge of their education, would think it worth their while diligently to watch, and carefully to prevent the undue connexion of ideas in the minds of young people. This is the time most susceptible of lasting impressions, and though those relating to the health of the body are by discreet people minded and fenced against, yet I am apt to doubt, that those which relate more peculiarly to the mind, and terminate in the understanding or passions, have been much less heeded than the thing deserves; nay, those relating purely to the understanding have, as I suspect, been by most men wholly overlooked.

§9. A great cause of errors. This wrong connexion in our minds of ideas in themselves loose and independent of one another, has such an influence, and is of so great force to set us awry in our actions, as well moral as natural, passions, reasonings, and notions themselves, that perhaps there is not any one thing that deserves more to be looked after.

§10. Instance. The ideas of goblins and sprites have really no more to do with darkness than light: yet let but a foolish maid inculcate these often on the mind of a child, and raise them there together, possibly he shall never be able to separate them again so long as he lives, but darkness shall ever afterwards bring with it those frightful ideas, and they shall be so joined, that he can no more bear the one than the other.

§11. Another instance. A man receives a sensible injury from another, thinks on the man and that action over and over, and by ruminating on them strongly, or much in his mind, so cements those

two ideas together, that he makes them almost one; never thinks on the man, but the pain and displeasure he suffered comes into his mind with it, so that he scarce distinguishes them, but has as much an aversion for the one as the other. Thus hatreds are often begotten from slight and innocent occasions, and quarrels propagated and continued in the world.

§12. A third instance. A man has suffered pain or sickness in any place, he saw his friend die in such a room; though these have in nature nothing to do one with another, yet when the idea of the place occurs to his mind, it brings (the impression being once made) that of the pain and displeasure with it, he confounds them in his mind, and can as little bear the one as the other.

§13. Why time cures some disorders in the mind, which reason cannot. When this combination is settled, and while it lasts, 'tis not in the power of reason to help us, and relieve us from the effects of it. Ideas in our minds, when they are there, will operate according to their natures and circumstances; and here we see the cause why time cures certain affections, which reason, though in the right, and allowed to be so, has not power over, nor is able against them to prevail with those who are apt to hearken to it in other cases. The death of a child that was the daily delight of its mother's eyes, and joy of her soul, rends from her heart the whole comfort of her life, and gives her all the torment imaginable: use the consolations of reason in this case, and you were as good preach ease to one on the rack, and hope to allay, by rational discourses, the pain of his joints tearing asunder. Till time has by disuse separated the sense of that enjoyment and its loss from the idea of the child returning to her memory, all representations, though ever so reasonable, are in vain; and therefore some in whom the union between these ideas is never dissolved, spend their lives in mourning, and carry an incurable sorrow to their graves.

§14. Further instance of the effect of the association of ideas. A friend of mine knew one perfectly cured of madness by a very harsh and offensive operation. The gentleman who was thus recovered, with great sense of gratitude and acknowledgment owned the cure all his life after, as the greatest obligation he could have received; but whatever gratitude and reason suggested to him, he could never bear the sight of the operator: that image brought back with it the idea of

that agony which he suffered from his hands, which was too mighty and intolerable for him to endure.

§15. More instances. Many children, imputing the pain they endured at school to their books they were corrected for, so join those ideas together, that a book becomes their aversion, and they are never reconciled to the study and use of them all their lives after; and thus reading becomes a torment to them, which otherwise possibly they might have made the great pleasure of their lives. There are rooms convenient enough, that some men cannot study in, and fashions of vessels, which, though never so clear and commodious, they cannot drink out of, and that by reason of some accidental ideas which are annexed to them, and make them offensive; and who is there that hath not observed some man to flag at the appearance, or in the company of some certain person not otherwise superior to him, but because having once on some occasion got the ascendant, the idea of authority and distance goes along with that of the person, and he that has been thus subjected, is not able to separate them.

§16. A curious instance. Instances of this kind are so plentiful everywhere, that if I add one more, 'tis only for the pleasant oddness of it. 'Tis of a young gentleman, who having learnt to dance, and that to great perfection, there happened to stand an old trunk in the room where he learnt. The idea of this remarkable piece of household stuff had so mixed itself with the turns and steps of all his dances, that though in that chamber he could dance excellently well, yet it was only whilst that trunk was there, nor could he perform well in any other place, unless that or some such other trunk had its due position in the room. If this story shall be suspected to be dressed up with some comical circumstances, a little beyond precise nature; I answer for myself that I had it some years since from a very sober and worthy man, upon his own knowledge, as I report it; and I dare say there are very few inquisitive persons who read this, who have not met with accounts, if not examples of this nature, that may parallel, or at least justify this.

§17. Its influence on intellectual habits. Intellectual habits and defects this way contracted, are not less frequent and powerful, though less observed.

Let the ideas of being and matter be strongly joined either by education or much thought, whilst these are still combined in the

mind, what notions, what reasonings, will there be about separate spirits' Let custom from the very childhood have joined figure and shape to the idea of God, and what absurdities will that mind be liable to about the Deity'

Let the idea of infallibility be inseparably joined to any person, and these two constantly together possess the mind, and then one body in two places at once, shall unexamined be swallowed for a certain truth, by an implicit faith, whenever that imagined infallible person dictates and demands assent without inquiry.

§18. Observable in different sects. Some such wrong and unnatural combinations of ideas will be found to establish the irreconcilable opposition between different sects of philosophy and religion; for we cannot imagine every one of their followers to impose wilfully on himself, and knowingly refuse truth offered by plain reason. Interest, though it does a great deal in the case, yet cannot be thought to work whole societies of men to so universal a perverseness, as that every one of them to a man should knowingly maintain falsehood: some at least must be allowed to do what all pretend to, i.e. to pursue truth sincerely; and therefore there must be something that blinds their understandings, and makes them not see the falsehood of what they embrace for real truth. That which thus captivates their reasons, and leads men of sincerity blindfold from common sense, will, when examined, be found to be what we are speaking of: some independent ideas, of no alliance to one another, are, by education, custom, and the constant din of their party, so coupled in their minds, that they always appear there together; and they can no more separate them in their thoughts than if they were but one idea, and they operate as if they were so. This gives sense to jargon, demonstration to absurdities, and consistency to nonsense, and is the foundation of the greatest, I had almost said of all the errors in the world; or if it does not reach so far, 'tis at least the most dangerous one, since so far as it obtains, it hinders men from seeing and examining. When two things in themselves disjoined, appear to the sight constantly united; if the eye sees these things riveted which are loose, where will you begin to rectify the mistakes that follow in two ideas that they have been accustomed so to join in their minds as to substitute one for the other, and, as I am apt to think, often without perceiving it themselves' This, whilst they are under the deceit of it, makes them incapable of conviction, and they applaud themselves as zealous champions for

truth, when indeed they are contending for error; and the confusion of two different ideas, which a customary connexion of them in their minds hath to them made in effect but one, fills their heads with false views, and their reasonings with false consequences.

§19. Conclusion. Having thus given an account of the original, sorts, and extent of our ideas, with several other considerations about these (I know not whether I may say) instruments, or materials of our knowledge; the method I at first proposed to myself would now require that I should immediately proceed to show, what use the understanding makes of them, and what knowledge we have by them. This was that which, in the first general view I had of this subject, was all that I thought I should have to do: but upon a nearer approach, I find that there is so close a connexion between ideas and words; and our abstract ideas and general words have so constant a relation one to another, that 'tis impossible to speak clearly and distinctly of our knowledge, which all consists in propositions, without considering, first, the nature, use, and signification of language; which therefore, must be the business of the next book.

BOOK III:Of Words

Chapter I Of Words or Language in General

§1. Man fitted to form articulate sounds. God having designed man for a sociable creature, made him not only with an inclination, and under a necessity to have fellowship with those of his own kind; but furnished him also with language, which was to be the great instrument, and common tie of society. Man therefore had by nature his organs so fashioned, as to be fit to frame articulate sounds, which we call words. But this was not enough to produce language; for parrots, and several other birds, will be taught to make articulate sounds distinct enough, which yet, by no means, are capable of language.

§2. To make them signs of ideas. Besides articulate sounds therefore, it was further necessary that he should be able to use these sounds, as signs of internal conceptions; and to make them stand as marks for the ideas within his own mind, whereby they might be made known to others, and the thoughts of men's minds be conveyed from one to another.

§3. To make general signs. But neither was this sufficient to make words so useful as they ought to be. 'Tis not enough for the perfection of language, that sounds can be made signs of ideas, unless those signs can be so made use of, as to comprehend several particular things: for the multiplication of words would have perplexed their use, had every particular thing need of a distinct name to be signified by. To remedy this inconvenience, language had yet a further improvement in the use of general terms, whereby one word was made to mark a multitude of particular existences: which advantageous use of sounds was obtained only by the difference of the ideas they were made signs of. Those names becoming general, which are made to stand for general ideas, and those remaining particular, where the ideas they are used for are particular.

§4. To make them signify the absence of positive ideas. Besides these names which stand for ideas, there be other words which men make use of, not to signify any idea, but the want or absence of some

ideas simple or complex, or all ideas together; such as are the nihil in Latin, and in English, ignorance and barrenness. All which negative or privative words, cannot be said properly to belong to, or signify no ideas: for then they would be perfectly insignificant sounds; but they relate to positive ideas, and signify their absence.

§5. Words ultimately derived from such as signify sensible ideas. It may also lead us a little towards the original of all our notions and knowledge, if we remark, how great a dependence our words have on common sensible ideas; and how those, which are made use of to stand for actions and notions quite removed from sense, have their rise from thence, and from obvious sensible ideas are transferred to more abstruse significations, and made to stand for ideas that come not under the cognizance of our senses; v.g. to imagine, apprehend, comprehend, adhere, conceive, instil, disgust, disturbance, tranquillity, etc. are all words taken from the operations of sensible things, and applied to certain modes of thinking. Spirit, in its primary signification, is breath; angel, a messenger: and I doubt not but, if we could trace them to their sources, we should find, in all languages, the names, which stand for things that fall not under our senses, to have had their first rise from sensible ideas. By which we may give some kind of guess, what kind of notions they were, and whence derived, which filled their minds, who were the first beginners of languages; and how nature, even in the naming of things, unawares suggested to men the originals and principles of all their knowledge: whilst, to give names, that might make known to others any operations they felt in themselves, or any other ideas, that came not under their senses, they were fain to borrow words from ordinary known ideas of sensation, by that means to make others the more easily to conceive those operations they experimented in themselves, which made no outward sensible appearances; and then when they had got known and agreed names to, signify those internal operations of their own minds, they were sufficiently furnished to make known by words, all their other ideas; since they could consist of nothing, but either of outward sensible perceptions, or of the inward operations of their minds about them; we having, as has been proved, no ideas at all, but what originally come either from sensible objects without, or what we feel within ourselves, from the inward workings of our own spirits, of which we are conscious to ourselves within.

§6. Distribution of subjects to be treated of. But to understand

better the use and force of language, as subservient to instruction and knowledge, it will be convenient to consider, First, To what 'tis that names, in the use of language, are immediately applied.

Secondly, Since all (except proper) names are general, and so stand not particularly for this or that single thing; but for sorts and ranks of things, it will be necessary to consider, in the next place, what the sorts and kinds, or, if you rather like the Latin names, what the species and genera of things are; wherein they consist; and how they come to be made. These being (as they ought) well looked into, we shall the better come to find the right use of words; the natural advantages and defects of language; and the remedies that ought to be used, to avoid the inconveniences of obscurity or uncertainty in the signification of words, without which, 'tis impossible to discourse with any clearness: or order: concerning knowledge: which being conversant about propositions, and those most commonly universal ones, has greater connexion with words, than perhaps is suspected.

These considerations therefore, shall be the matter of the following chapters.

Chapter II Of the Signification of Words

§1. Words are sensible signs necessary for communication. Man, though he have great variety of thoughts, and such, from which others, as well as himself, might receive profit and delight; yet they are all within his own breast, invisible, and hidden from others, nor can of themselves be made to appear. The comfort, and advantage of society, not being to be had without communication of thoughts, it was necessary, that man should find out some external sensible signs, whereby those invisible ideas, which his thoughts are made up of, might be made known to others. For this purpose, nothing was so fit, either for plenty or quickness, as those articulate sounds, which with so much ease and variety, he found himself able to make. Thus we may conceive how words, which were by nature so well adapted to that purpose, came to be made use of by men, as the signs of their ideas; not by any natural connexion, that there is between particular articulate sounds and certain ideas, for then there would be but one language amongst all men; but by a voluntary imposition, whereby such a word is made arbitrarily the mark of such an idea. The use then of words, is to be sensible marks of ideas; and the ideas they stand for,

are their proper and immediate signification.

§2. Words are the sensible signs of his ideas who uses them. The use men have of these marks, being either to record their own thoughts for the assistance of their own memory; or, as it were, to bring out their ideas, and lay them before the view of others: words in their primary or immediate signification, stand for nothing, but the ideas in the mind of him that uses them, how imperfectly soever, or carelessly those ideas are collected from the things, which they are supposed to represent. When a man speaks to another, it is, that he may be understood; and the end of speech is, that those sounds, as marks, may make known his ideas to the hearer. That then which words are the marks of, are the ideas of the speaker: nor can any one apply them, as marks, immediately to anything else, but the ideas, that he himself hath: for this would be to make them signs of his own conceptions, and yet apply them to other ideas; which would be to make them signs, and not signs of his ideas at the same time; and so in effect, to have no signification at all. Words being voluntary signs, they cannot be voluntary signs imposed by him on things he knows not. That would be to make them signs of nothing, sounds without signification. A man cannot make his words the signs either of qualities in things, or of conceptions in the mind of another, whereof he has none in his own. Till he has some ideas of his own, he cannot suppose them to correspond with the conceptions of another man; nor can he use any signs for them: for thus they would be the signs of he knows not what, which is in truth to be the signs of nothing. But when he represents to himself other men's ideas, by some of his own, if he consent to give them the same names, that other men do, 'tis still to his own ideas; to ideas that he has, and not to ideas that he has not.

§3. Examples of this. This is so necessary in the use of language, that in this respect, the knowing, and the ignorant; the learned and unlearned, use the words they speak (with any meaning) all alike. They, in every man's mouth, stand for the ideas he has, and which he would express by them. A child having taken notice of nothing in the metal he hears called gold, but the bright shining yellow colour, he applies the word gold only to his own idea of that colour, and nothing else; and therefore calls the same colour in a peacock's tail gold. Another that hath better observed, adds to shining yellow, great weight: and then the sound gold, when he uses it, stands for a complex idea of a shining yellow and a very weighty

substance. Another adds to those qualities, fusibility: and then the word gold to him signifies a body, bright, yellow, fusible, and very heavy. Another adds malleability. Each of these uses equally the word gold, when they have occasion to express the idea, which they have applied it to: but 'tis evident, that each can apply it only to his own idea; nor can he make it stand, as a sign of such a complex idea, as he has not.

§4. Words often secretly referred, first, to the ideas to in other men's minds. But though words, as they are used by men, can properly and immediately signify nothing but the ideas, that are in the mind of the speaker; yet they in their thoughts give them a secret reference to two other things.

First, they suppose their words to be marks of the ideas in the minds also of other men, with whom they communicate: for else they should talk in vain, and could not be understood, if the sounds they applied to one idea, were such, as by the hearer, were applied to another, which is to speak two languages. But in this, men stand not usually to examine, whether the idea they, and those they discourse with have in their minds, be the same: but think it enough, that they use the word, as they imagine, in the common acceptation of that language; in which they suppose, that the idea, they make it a sign of, is precisely the same, to which the understanding men of that country apply that name.

§5. To the reality of things. Secondly, because men would not be thought to talk barely of their own imagination, but of things as really they are; therefore they often suppose the words to stand also for the reality of things. But this relating more particularly to substances, and their names, as perhaps the former does to simple ideas and modes, we shall speak of these two different ways of applying words more at large, when we come to treat of the names of mixed modes, and substances, in particular: though give me leave here to say, that 'tis a perverting the use of words, and brings unavoidable obscurity and confusion into their signification whenever we make them stand for anything, but those ideas we have in our own minds.

§6. Words by use readily excite ideas. Concerning words also 'tis further to be considered:

First, that they being immediately the signs of men's ideas; and, by

that means, the instruments whereby men communicate their conceptions, and express to one another those thoughts and imaginations, they have within their own breasts, there comes by constant use, to be such a connexion between certain sounds, and the ideas they stand for, that the names heard, almost as readily excite certain ideas, as if the objects themselves, which are apt to produce them, did actually affect the senses. Which is manifestly so in all obvious sensible qualities; and in all substances, that frequently, and familiarly occur to us.

§7. Words often used without signification. Secondly, that though the proper and immediate signification of words, are ideas in the mind of the speaker; yet because by familiar use from our cradles, we come to learn certain articulate sounds very perfectly, and have them readily on our tongues, and always at hand in our memories; but yet are not always careful to examine, or settle their significations perfectly; it often happens that men, even when they would apply themselves to an attentive consideration, do set their thoughts more on words than things. Nay, because words are many of them learned before the ideas are known for which they stand: therefore some, not only children, but men, speak several words, no otherwise than parrots do, only because they have learned them, and have been accustomed to those sounds. But so far as words are of use and signification, so far is there a constant connexion between the sound and the idea and a designation, that the one stand for the other: without which application of them, they are nothing but so much insignificant noise.

§8. Their signification perfectly arbitrary. Words by long and familiar use, as has been said, come to excite in men certain ideas, so constantly and readily, that they are apt to suppose a natural connexion between them. But that they signify only men's peculiar ideas, and that by a perfect arbitrary imposition, is evident, in that they often fail to excite in others (even that use the same language) the same ideas, we take them to be the signs of: and every man has so inviolable a liberty, to make words stand for what ideas he pleases, that no one hath the power to make others have the same ideas in their minds, that he has, when they use the same words, that he does. And therefore the great Augustus himself, in the possession of that power which ruled the world, acknowledged, he could not make a new Latin word: which was as much as to say, that he could not arbitrarily appoint, what idea any sound should be a sign of, in the

mouths and common language of his subjects. 'Tis true, common use, by a tacit consent, appropriates certain sounds to certain ideas in all languages, which so far limits the signification of that sound, that unless a man applies it to the same idea, he does not speak properly: and let me add, that unless a man's words excite the same ideas in the hearer, which he makes them stand for in speaking, he does not speak intelligibly. But whatever be the consequence of any man's using of words differently, either from their general meaning, or the particular sense of the person to whom he addresses them, this is certain, their signification, in his use of them, is limited to his ideas, and they can be signs of nothing else.

Chapter III Of General Terms

§1. The greatest part of words general. All things, that exist, being particulars, it may perhaps be thought reasonable that words, which ought to be conformed to things, should be so too, I mean in their signification: but yet we find the quite contrary. The far greatest part of words, that make all languages, are general terms: which has not been the effect of neglect, or chance, but of reason, and necessity.

§2. For every particular thing to have a name is impossible. First, 'Tis impossible, that every particular thing should have a distinct peculiar name. For the signification and use of words, depending on that connexion, which the mind makes between its ideas, and the sounds it uses as signs of them, 'tis necessary, in the application of names to things, that the mind should have distinct ideas of the things, and retain also the particular name that belongs to every one, with its peculiar appropriation to that idea. But 'tis beyond the power of human capacity to frame and retain distinct ideas of all the particular things we meet with: every bird, and beast men saw; every tree, and plant, that affected the senses, could not find a place in the most capacious understanding. If it be looked on, as an instance of a prodigious memory, that some generals have been able to call every soldier in their army, by his proper name: we may easily find a reason, why men have never attempted to give names to each sheep in their flock, or crow that flies over their heads; much less to call every leaf of plants, or grain of sand that came in their way, by a peculiar name.

§3. And useless. Secondly, if it were possible, it would yet be useless; because it would not serve to the chief end of language. Men

would in vain heap up names of particular things, that would not serve them to communicate their thoughts. Men learn names, and use them in talk with others, only that they may be understood: which is then only done, when by use or consent, the sound I make by the organs of speech, excites in another man's mind, who hears it, the idea I apply it to in mine, when I speak it. This cannot be done by names, applied to particular things, whereof I alone having the ideas in my mind, the names of them could not be significant, or intelligible to another, who was not acquainted with all those very particular things, which had fallen under my notice.

§4. A distinct name for every particular thing, not fitted for enlargement of knowledge. Thirdly, but yet granting this also feasible; (which I think is not,) yet a distinct name for every particular thing, would not be of any great use for the improvement of knowledge: which though founded in particular things, enlarges itself by general views; to which things reduced into sorts, under general names, are properly subservient. These, with the names belonging to them, come within some compass, and do not multiply every moment, beyond what, either the mind can contain, or use requires. And therefore in these, men have for the most part stopped: but yet not so, as to hinder themselves from distinguishing particular things, by appropriated names, where convenience demands it. And therefore in their own species, which they have most to do with, and wherein they have often occasion to mention particular persons; they make use of proper names, and there distinct individuals have distinct denominations.

§5. What things have proper names. Besides persons, countries also, cities, rivers, mountains, and other the like distinctions of place, have usually found peculiar names, and that for the same reason; they being such as men have often an occasion to mark particularly, and, as it were, set before others in their discourses with them. And I doubt not, but if we had reason to mention particular horses as often, as we have to mention particular men, we should have proper names for the one, as familiar as for the other and Bucephalus would be a word as much in use, as Alexander. And therefore we see that, amongst jockeys, horses have their proper names to be known and distinguished by, as commonly as their servants: because amongst them, there is often occasion to mention this or that particular horse, when he is out of sight.

§6. How general words are made. The next thing to be considered is, How general words come to be made. For since all things that exist are only particulars, how come we by general terms; or where find we those general natures they are supposed to stand for? Words become general by being made the signs of general ideas: and ideas become general, by separating from them the circumstances of time, and place, and any other ideas, that may determine them to this or that particular existence. By this way of abstraction they are made capable of representing more individuals than one; each of which having in it a conformity to that abstract idea, is (as we call it) of that sort.

§7. Shown by the way we enlarge our complex ideas from infancy.

But to deduce this a little more distinctly, it will not perhaps be amiss, to trace our notions, and names, from their beginning, and observe by what degrees we proceed, and by what steps we enlarge our ideas from our first infancy. There is nothing more evident, than that the ideas of the persons children converse with, (to instance in them alone) are like the persons themselves, only particular. The ideas of the nurse, and the mother, are well framed in their minds; and, like pictures of them there, represent only those individuals. The names they first gave to them, are confined to these individuals; and the names of Nurse and Mamma, the child uses, determine themselves to those persons. Afterwards, when time and a larger acquaintance have made them observe, that there are a great many other things in the world, that in some common agreements of shape, and several other qualities, resemble their father and mother, and those persons they have been used to, they frame an idea, which they find those many particulars do partake in; and to that they give, with others, the name man for example. And thus they come to have a general name, and a general idea. Wherein they make nothing new, but only leave out of the complex idea they had of Peter and James, Mary and Jane, that which is peculiar to each, and retain only what is common to them all.

§8. And further enlarge our complex ideas, by still leaving out properties contained in them. By the same way, that they come by the general name and idea of man, they easily advance to more general names and notions. For observing, that several things that differ from their idea of man, and cannot therefore be comprehended under that name, have yet certain qualities, wherein they agree with man, by

retaining only those qualities, and uniting them into one idea, they have again another and a more general idea; to which having given a name, they make a term of a more comprehensive extension: which new idea is made, not by any new addition, but only, as before, by leaving out the shape, and some other properties signified by the name man, and retaining only a body, with life, sense, and spontaneous motion, comprehended under the name animal.

§9. General natures are nothing but abstract ideas. That this is the way, whereby men first formed general ideas, and general names to them, I think, is so evident, that there needs no other proof of it, but the considering of a man's self, or others, and the ordinary proceedings of their minds in knowledge: and he that thinks general natures or notions, are anything else but such abstract and partial ideas of more complex ones, taken at first from particular existences, will, I fear, be at a loss where to find them. For let anyone reflect, and then tell me, wherein does his idea of man differ from that of Peter and Paul; or his idea of horse, from that of Bucephalus, but in the leaving out something, that is peculiar to each individual; and retaining so much of those particular complex ideas, of several particular existences, as they are found to agree in? Of the complex ideas, signified by the names man, and horse, leaving out but those particulars wherein they differ, and retaining only those wherein they agree, and of those, making a new distinct complex idea, and giving the name animal to it, one has a more general term, that comprehends, with man, several other creatures. Leave out of the idea of animal, sense and spontaneous motion, and the remaining complex idea, made up of the remaining simple ones of body, life, and nourishment, becomes a more general one, under the more comprehensive term, vivens. And not to dwell longer upon this particular, so evident in itself, by the same way the mind proceeds to body, substance, and at last to being, thing, and such universal terms, which stand for any of our ideas whatsoever. To conclude, this whole mystery of genera and species, which make such a noise in the Schools, and are, with justice, so little regarded out of them, is nothing else but abstract ideas, more or less comprehensive, with names annexed to them. In all which, this is constant and unvariable, That every more general term, stands for such an idea, as is but a part of any of those contained under it.

§10. Why the genus is ordinarily made use of in definitions. This

may show us the reason why, in the defining of words, which is nothing but declaring their signification, we make use of the genus, or next general word that comprehends it. Which is not out of necessity, but only to save the labour of enumerating the several simple ideas, which the next general word or genus, stands for; or, perhaps, sometimes the shame of not being able to do it. But though defining by genus and differentia, (I crave leave to use these terms of art, though originally Latin, since they most properly suit those notions they are applied to;) I say, though defining by the genus be the shortest way; yet, I think, it may be doubted, whether it be the best. This I am sure, 'tis not the only, and so not absolutely necessary. For definition being nothing but making another understand by words, what idea, the term defined stands for, a definition is best made by enumerating those simple ideas that are combined in the signification of the term defined: and if instead of such an enumeration, men have accustomed themselves to use the next general term, it has not been out of necessity, or for greater clearness but for quickness and dispatch sake. For, I think, that to one who desired to know what idea the word man stood for; if it should be said, that man was a solid extended substance, having life, sense, spontaneous motion, and the faculty of reasoning, I doubt not but the meaning of the term man, would be as well understood, and the idea it stands for, be at least as clearly made known, as when 'tis defined to be a rational animal; which by the several definitions of animal, vivens, and corpus, resolves itself into those enumerated ideas. I have in explaining the term man, followed here the ordinary definition of the Schools: which though, perhaps, not the most exact, yet serves well enough to my present purpose. And one may in this instance, see what gave occasion to the rule, that a definition must consist of genus, and differentia: and it suffices to show us the little necessity there is of such a rule, or advantage in the strict observing of it. For definitions, as has been said, being only the explaining of one word, by several others, so that the meaning, or idea it stands for, may be certainly known, languages are not always so made, according to the rules of logic, that every term can have its signification, exactly and clearly expressed by two others. Experience sufficiently satisfies us to the contrary; or else those who have made this rule, have done ill, that they have given us so few definitions conformable to it. But of definitions, more in the next chapter.

§11. General and universal are creatures of the understanding. To

return to general words, 'tis plain, by what has been said, that general and universal, belong not to the real existence of things; but are the inventions and creatures of the understanding, made by it for its own use, and concern only signs, whether words, or ideas. Words are general, as has been said, when used, for signs of general ideas; and so are applicable indifferently to many particular things; and ideas, are general, when they are set up, as the representatives of many particular things: but universality belongs not to things themselves, which are all of them particular in their existence, even those words, and ideas, which in their signification, are general. When therefore we quit particulars, the generals that rest, are only creatures of our own making, their general nature being nothing but the capacity they are put into by the understanding, of signifying or representing many particulars. For the signification they have, is nothing but a relation, that by the mind of man is added to them.

§12. Abstract ideas are the essences of the genera and species. The next thing therefore to be considered is, What kind of signification 'tis, that general words have. For, as 'tis evident, that they do not signify barely one particular thing; for then they would not be general terms, but proper names; so on the other side, 'tis as evident, they do not signify a plurality; for man and men would then signify the same; and the distinction of numbers (as grammarians call them) would be superfluous and useless. That then which general words signify, is a sort of things; and each of them does that, by being a sign of an abstract idea in the mind, to which idea, as things existing are found to agree, so they come to be ranked under that name; or, which is all one, be of that sort. Whereby 'tis evident, that the essences of the sorts, or (if the Latin word pleases better) species of things, are nothing else but these abstract ideas. For the having the essence of any species, being that which makes anything to be of that species, and the conformity to the idea, to which the name is annexed, being that which gives a right to that name, the having the essence, and the having that conformity, must needs be the same thing: since to be of any species, and to have a right to the name of that species, is all one. As for example, to be a man, or of the species man, and to have right to the name man, is the same thing. Again, to be a man, or of the same species man, and have the essence of a man, is the same thing. Now, since nothing can be a man, or have a right to the name man, but what has a conformity to the abstract idea the name man stands for; nor anything be a man, or have a right to the species man,

but what has the essence of that species, it follows, that the abstract idea, for which the name stands, and the essence of the species, is one and the same. From whence 'tis easy to observe, that the essences of the sorts of things, and consequently the sorting of things, is the workmanship of the understanding that abstracts and makes those general ideas.

§13. They are the workmanship of the understanding, but have their foundation in the similitude of things. I would not here be thought to forget, much less to deny, that Nature in the production of things, makes several of them alike: there is nothing more obvious, especially in the race of animals, and all things propagated by seed. But yet, I think, we may say, the sorting of them under names, is the workmanship of the understanding, taking occasion from the similitude it observes amongst them, to make abstract general ideas, and set them up in the mind, with names annexed to them, as patterns or forms, (for in that sense the word form has a very proper signification,) to which, as particular things existing are found to agree, so they come to be of that species, have that denomination, or are put into that classis. For when we say, this is a man, that a horse; this justice, that cruelty; this a watch, that a jack; what do we else but rank things under different specific names, as agreeing to those abstract ideas, of which we have made those names the signs? And what are the essences of those species, set out and marked by names, but those abstract ideas in the mind; which are, as it were, the bonds between particular things that exist, and the names they are to be ranked under? And when general names have any connexion with particular beings, these abstract ideas are the medium that unites them: so that the essences of species, as distinguished and denominated by us, neither are, nor can be anything but those precise abstract ideas we have in our minds. And therefore the supposed real essences of substances, if different from our abstract ideas, cannot be the essences of the species we rank things into. For two species may be one, as rationally, as two different essences be the essence of one species: and I demand, what are the alterations may, or may not be in a horse, or lead, without making either of them to be of another species? In determining the species of things by our abstract ideas, this is easy to resolve: but if any one will regulate himself herein, by supposed real essences, he will, I suppose, be at a loss: and he will never be able to know when anything precisely ceases to be of the species of a horse, or lead.

§14. Each distinct abstract idea is a distinct essence. Nor will any one wonder, that I say these essences, or abstract ideas, (which are the measures of name, and the boundaries of species) are the workmanship of the understanding, who considers, that at least the complex ones are often, in several men, different collections of simple ideas: and therefore that is covetousness to one man, which is not so to another. Nay, even in substances, where their abstract ideas seem to be taken from the things themselves, they are not constantly the same; no not in that species, which is most familiar to us, and with which we have the most intimate acquaintance: it having been more than once doubted, whether the foetus born of a woman were a man, even so far, as that it hath been debated, whether it were, or were not to be nourished and baptized: which could not be, if the abstract idea or essence, to which the name man belonged, were of nature's making; and were not the uncertain and various collection of simple ideas, which the understanding put together, and then abstracting it, affixed a name to it. So that in truth every distinct abstract idea, is a distinct essence: and the names that stand for such distinct ideas, are the names of things essentially different. Thus a circle is as essentially different from an oval, as a sheep from a goat: and rain is as essentially different from snow, as water from earth: that abstract idea which is the essence of one, being impossible to be communicated to the other. And thus any two abstract ideas, that in any part vary one from another, with two distinct names annexed to them, constitute two distinct sorts, or, if you please, species, as essentially different, as any two the most remote, or opposite in the world.

§15. Real and nominal essence. But since the essences of things are thought, by some, (and not without reason,) to be wholly unknown; it may not be amiss to consider the several significations of the word essence.

Real essences. First, essence may be taken for the very being of anything, whereby 'tis what it is. And thus the real internal, but generally, in substances, unknown constitution of things, whereon their discoverable qualities depend, may be called their essence. This is the proper original signification of the word, as is evident from the formation of it; *essentia*, in its primary notation signifying properly being. And in this sense 'tis still used, when we speak of the essence of particular things, without giving them any name.

Nominal essences. Secondly, the learning and disputes of the Schools, having been much busied about genus and species, the word essence has almost lost its primary signification; and instead of the real constitution of things, has been almost wholly applied to the artificial constitution of genus and species. 'Tis true, there is ordinarily supposed a real constitution of the sorts of things; and 'tis past doubt, there must be some real constitution, on which any collection of simple ideas coexisting, must depend. But it being evident, that things are ranked under names into sorts or species, only as they agree to certain abstract ideas, to which we have annexed those names, the essence of each genus, or sort, comes to be nothing but that abstract idea, which the general, or sortal (if I may have leave so to call it from sort, as I do general from genus,) name stands for. And this we shall find to be that, which the word essence imports, in its most familiar use. These two sorts of essences, I suppose, may not unfitly be termed, the one the real, the other the nominal essence.

§16. Constant connexion between the name and nominal essence. Between the nominal essence, and the name, there is so near a connexion, that the name of any sort of things cannot be attributed to any particular being, but what has this essence, whereby it answers that abstract idea, whereof that name is the sign.

§17. Supposition that species are distinguished by their real essences, useless. Concerning the real essences of corporeal substances, (to mention these only,) there are, if I mistake not, two opinions. The one is of those, who using the word essence, for they know not what, suppose a certain number of those essences, according to which, all natural things are made, and wherein they do exactly every one of them partake, and so become of this or that species. The other, and more rational opinion, is of those, who look on all natural things to have a real, but unknown constitution of their insensible parts, from which flow those sensible qualities, which serve us to distinguish them one from another, according as we have occasion to rank them into sorts, under common denominations. The former of these opinions, which supposes these essences, as a certain number of forms or moulds, wherein all natural things, that exist, are cast, and do equally partake, has, I imagine, very much perplexed the knowledge of natural things. The frequent productions of monsters, in all the species of animals, and of changelings, and other strange issues of human birth, carry with them difficulties, not possible to consist with this

hypothesis: since 'tis as impossible, that two things, partaking exactly of the same real essence, should have different properties, as that two figures partaking in the same real essence of a circle, should have different properties. But were there no other reason against it, yet the supposition of essences, that cannot be known; and the making them nevertheless to be that, which distinguishes the species of things, is so wholly useless, and unserviceable to any part of our knowledge, that that alone were sufficient, to make us lay it by; and content ourselves with such essences of the sorts or species of things, as come within the reach of our knowledge: which, when seriously considered, will be found, as I have said, to be nothing else, but those abstract complex ideas, to which we have annexed distinct general names.

§18. Real and nominal essence the same in simple ideas and modes, different in substances. Essences being thus distinguished into nominal and real, we may further observe, that in the species of simple ideas and modes, they are always the same: but in substances, always quite different. Thus a figure including a space between three lines, is the real, as well as nominal essence of a triangle; it being not only the abstract idea to which the general name is annexed, but the very *essentia*, or being, of the thing itself, that foundation from which all its properties flow, and to which they are all inseparably annexed. But 'tis far otherwise concerning that parcel of matter, which makes the ring on my finger, wherein these two essences are apparently different. For 'tis the real constitution of its insensible parts, on which depend all those properties of colour, weight, fusibility, fixedness, etc., which makes it to be gold, or gives it a right to that name, which is therefore its nominal essence. Since nothing can be called gold, but what has a conformity of qualities to that abstract complex idea, to which that name is annexed. But this distinction of essences, belonging particularly to substances, we shall, when we come to consider their names, have an occasion to treat of more fully.

§19. Essences ingenerable and incorruptible. That such abstract ideas, with names to them, as we have been speaking of, are essences, may further appear by what we are told concerning essences, viz. that they are all ingenerable, and incorruptible. Which cannot be true of the real constitutions of things, which begin and perish with them. All things, that exist, besides their Author, are all liable to change; especially those things we are acquainted with, and have

ranked into bands, under distinct names or ensigns. Thus, that, which was grass today, is tomorrow the flesh of a sheep; and within a few days after, becomes part of a man: in all which, and the like changes,'tis evident, their real essence—i.e. that constitution, whereon the properties of these several things depended, is destroyed, and perishes with them. But essences being taken for ideas, established in the mind, with names annexed to them, they are supposed to remain steadily the same, whatever mutations the particular substances are liable to. For whatever becomes of Alexander and Bucephalus, the ideas to which man and horse are annexed, are supposed nevertheless to remain the same; and so the essences of those species are preserved whole and undestroyed, whatever changes happen to any, or all of the individuals of those species. By this means the essence of a species rests safe and entire, without the existence of so much as one individual of that kind. For were there now no circle existing anywhere in the world, (as perhaps, that figure exists not anywhere exactly marked out,) yet the idea annexed to that name would not cease to be what it is; nor cease to be as a pattern, to determine which of the particular figures we meet with, have, or have not a right to the name circle, and so to show, which of them, by having that essence, was of that species. And though there neither were, nor had been in nature such a beast as an unicorn, or such a fish as a mermaid; yet supposing those names to stand for complex abstract ideas, that contained no inconsistency in them; the essence of a mermaid is as intelligible, as that of a man; and the idea of an unicorn, as certain, steady, and permanent, as that of a horse. From what has been said, 'tis evident, that the doctrine of the immutability of essences, proves them to be only abstract ideas; and is founded on the relation, established between them, and certain sounds as signs of them; and will always be true, as long as the same name can have the same signification.

§20. Recapitulation. To conclude, this is that, which in short I would say, viz. that all the great business of genera and species, and their essences, amounts to no more but this, that men making abstract ideas, and settling them in their minds, with names annexed to them, do thereby enable themselves to consider things, and discourse of them, as it were in bundles, for the easier and readier improvement, and communication of their knowledge, which would advance but slowly, were their words and thoughts confined only to particulars.

Chapter IV Of the Names of Simple Ideas

§1. Names of simple ideas, modes, and substances, have each something peculiar. Though all words, as I have shown, signify nothing immediately, but the ideas in the mind of the speaker; yet upon a nearer survey, we shall find that the names of simple ideas, mixed modes, (under which I comprise relations too,) and natural substances, have each of them something peculiar, and different from the other. For example:

§2. Names of simple ideas and substances, intimate real existence. First, the names of simple ideas and substances, with the abstract ideas in the mind, which they immediately signify, intimate also some real existence, from which was derived their original pattern. But the names of mixed modes, terminate in the idea that is in the mind, and lead not the thoughts any further, as we shall see more at large in the following chapter.

§3. Names of simple ideas and modes signify always both real and nominal essences. Secondly, The names of simple ideas and modes, signify always the real, as well as nominal essence of their species. But the names of natural substances, signify rarely, if ever, anything but barely the nominal essences of those species, as we shall show in the chapter that treats of the names of substances in particular.

§4. Names of simple ideas undefinable. Thirdly, The names of simple ideas are not capable of any definition; the names of all complex ideas are. It has not, that I know, hitherto been taken notice of by anybody, what words are, and what are not capable of being defined: the want whereof is (as I am apt to think) not seldom the occasion of great wrangling, and obscurity in men's discourses, whilst some demand definitions of terms, that cannot be defined; and others think, they ought to rest satisfied, in an explication made by a more general word, and its restriction, (or to speak in terms of art by a genus and difference,) when even after such definition made according to rule those who hear it, have often no more a clear conception of the meaning of the word, than they had before. This at least, I think, that the showing what words are, and what are not capable of definitions, and wherein consists a good definition, is not wholly besides our present purpose; and perhaps, will afford so much light to the nature of these signs, and our ideas, as to deserve a more

particular consideration.

§5. If all were definable, 'twould be a process in infinitum. I will not here trouble myself, to prove that all terms are not definable from that progress, in infinitum, which it will visibly lead us into, if we should allow, that all names could be defined. For if the terms of one definition, were still to be defined by another, where at last should we stop? But I shall from the nature of our ideas, and the signification of our words show, why some names can, and others cannot be defined and which they are.

§6. What a definition is. I think 'tis agreed, that a definition is nothing else, but the showing the meaning of one word by several other not synonymous terms. The meaning of words being only the ideas they are made to stand for by him that uses them; the meaning of any term is then showed, or the word is defined when by other words, the idea 'tis made the sign of, and annexed to in the mind of the speaker, is as it were represented, or set before the view of another; and thus its signification ascertained: This is the only use and end of definitions; and therefore the only measure of what is, or is not a good definition.

§7. Simple ideas, why undefinable. This being premised, I say, that the names of simple ideas, and those only, are incapable of being defined. The reason whereof is this, that the several terms of a definition, signifying several ideas, they can altogether by no means represent an idea, which has no composition at all: and therefore a definition which is properly nothing but the showing the meaning of one word by several others not signifying each the same thing, can in the names of simple ideas have no place.

§8. Instances motion. The not observing this difference in our ideas, and their names, has produced that eminent trifling in the schools, which is so easy to be observed, in the definitions they give us of some few of these simple ideas. For as to the greatest part of them, even those masters of definitions, were fain to leave them untouched, merely by the impossibility they found in it. What more exquisite jargon could the wit of man invent, than this definition, 'the act of a being in power, as far forth as in power', which would puzzle any rational man, to whom it was not already known by its famous absurdity, to guess what word it could ever be supposed to be the explication of. If Tully asking a Dutchman what beweegeinge was,

should have received this explication in his own language, that it was 'actus entis in potentia quatenus in potentia'; I ask whether anyone can imagine he could thereby have understood what the word *beweeginge* signified, or have guessed what idea a Dutchman ordinarily had in his mind, and would signify to another, when he used that sound.

§9. Modern definitions of motion. Nor have the modern philosophers, who have endeavoured to throw off the jargon of the schools, and speak intelligibly, much better succeeded in defining simple ideas, whether by explaining their causes, or any otherwise. The atomists, who define motion to be a passage from one place to another, what do they more than put one synonymous word for another? For what is passage other than motion? And if they were asked what passage was, how would they better define it than by motion? For is it not at least as proper and significant, to say, 'passage is a motion from one place to another', as to say, 'motion is a passage', etc. This is to translate, and not to define, when we change two words of the same signification one for another; which when one is better understood than the other, may serve to discover what idea the unknown stands for; but is very far from a definition, unless we will say, every English word in the dictionary, is the definition of the Latin word it answers, and that motion is a definition of *motus*. Nor will the successive application of the parts of the superficies of one body, to those of another, which the Cartesians give us, prove a much better definition of motion, when well examined.

§10. Light. 'The act of perspicuous, as far forth as perspicuous,' is another Peripatetic definition of a simple idea; which though not more absurd than the former of motion, yet betrays its uselessness and insignificancy more plainly, because experience will easily convince anyone, that it cannot make the meaning of the word light (which it pretends to define) at all understood by a blind man; but the definition of motion appears not at first sight so useless, because it escapes this way of trial. For this simple idea, entering by the touch as well as sight; 'tis impossible to show an example of anyone, who has no other way to get the idea of motion, but barely by the definition of that name. Those who tell us, that light is a great number of little globules, striking briskly on the bottom of the eye, speak more intelligibly than the Schools: but yet these words never so well understood, would make the idea, the word light stands for, no more known to a man that

understands it not before, than if one should tell him, that light was nothing but a company of little tennis-balls, which fairies all day long struck with rackets against some men's foreheads, whilst they passed by others. For granting this explication of the thing to be true; yet the idea of the cause of light, if we had it never so exact, would no more give us the idea of light itself, as 'tis such a particular perception in us, than the idea of the figure and motion of a sharp piece of steel, would give us the idea of that pain, which 'tis able to cause in us. For the cause of any sensation, and the sensation itself, in all the simple ideas of one sense, are two ideas; and two ideas so different, and distant one from another, that no two can be more so. And therefore should Descartes's globules strike never so long on the retina of a man, who was blind by a gutta serena, he would thereby never have any idea of light, or anything approaching to it, though he understood what little globules were, and what striking on another body was, never so well. And therefore the Cartesians very well distinguish between that light which is the cause of that sensation in us, and the idea which is produced in us by it, and is that which is properly light.

§11. Simple ideas why undefinable, further explained. Simple ideas, as has been shown, are only to be got by those impressions objects themselves make on our minds, by the proper inlets appointed to each sort. If they are not received this way, all the words in the world, made use of to explain, or define any of their names, will never be able to produce in us the idea it stands for. For words being sounds, can produce in us no other simple ideas, than of those very sounds; nor excite any in us, but by that voluntary connexion, which is known to be between them, and those simple ideas, which common use has made them signs of. He that thinks otherwise, let him try if any words can give him the taste of a pineapple, and make him have the true idea of the relish of that celebrated delicious fruit. So far as he is told it has a resemblance with any tastes, whereof he has the ideas already in his memory, imprinted there by sensible objects not strangers to his palate, so far may he approach that resemblance in his mind. But this is not giving us that idea by a definition, but exciting in us other simple ideas by their known names; which will be still very different from the true taste of that fruit itself. In light and colours, and all other simple ideas, 'tis the same thing: for the signification of sounds, is not natural, but only imposed and arbitrary. And no definition of light or redness, is more fitted, or able to produce either of those ideas in us, than the sound light, or red, by itself. For to hope

to produce an idea of light, or colour, by a sound, however formed, is to expect that sounds should be visible, or colours audible; and to make the ears do the office of all the other senses. Which is all one as to say, that we might taste, smell, and see by the ears: a sort of philosophy worthy only of Sancho Panza, who had the faculty to see Dulcinea by hearsay. And therefore he that has not before received into his mind, by the proper inlet, the simple idea which any word stands for, can never come to know the signification of that word, by any other words, or sounds, whatsoever put together, according to any rules of definition. The only way is, by applying to his senses the proper object; and so producing that idea in him, for which he has learned the name already. A studious blind man, who had mightily beat his head about visible objects, and made use of the explication of his books and friends, to understand those names of light, and colours, which often came in his way; bragged one day, that he now understood what scarlet signified. Upon which his friend demanding, what scarlet was? The blind man answered, it was like the sound of a trumpet. Just such an understanding of the name of any other simple idea will he have, who hopes to get it only from a definition, or other words made use of to explain it.

§12. The contrary showed in complex ideas by instances of a statue and rainbow. The case is quite otherwise in complex ideas; which consisting of several simple ones, 'tis in the power of words, standing for the several ideas, that make that composition, to imprint complex ideas in the mind, which were never there before, and so make their names be understood. In such collections of ideas, passing under one name, definition, or the teaching the signification of one word, by several others, has place, and may make us understand the names of things, which never came within the reach of our senses; and frame ideas suitable to those in other men's minds, when they use those names: provided that none of the terms of the definition stand for any such simple ideas, which he to whom the explication is made, has never yet had in his thought. Thus the word statue may be explained to a blind man by other words, when picture cannot, his senses having given him the idea of figure, but not of colours, which therefore words cannot excite in him. This gained the prize to the painter, against the statuary: each of which contending for the excellency of his art, and the statuary bragging, that his was to be preferred, because it reached further, and even those who had lost their eyes, could yet perceive the excellency of it. The painter agreed

to refer himself to the judgment of a blind man; who being brought where there was a statue made by the one, and a picture drawn by the other; he was first led to the statue, in which he traced with his hands, all the lineaments of the face and body; and with great admiration, applauded the skill of the workman. But being led to the picture, and having his hands laid upon it, was told, that now he touched the head, and then the forehead, eyes, nose, etc. as his hand moved over the parts of the picture on the cloth, without finding any the least distinction: whereupon he cried out, that certainly that must needs be a very admirable and divine piece of workmanship, which could represent to them all those parts, where he could neither feel nor perceive anything.

§13. Colours indefinable to the bornblind. He that should use the word rainbow, to one who knew all those colours, but yet had never seen that phenomenon, would, by enumerating the figure, largeness, position, and order of the colours, so well define that word that it might be perfectly understood. But yet that definition, how exact and perfect soever, would never make a blind man understand it; because several of the simple ideas that make that complex one, being such as he never received by sensation and experience, no words are able to excite them in his mind.

§14. The names complex ideas, when to be made intelligible by words. Simple ideas, as has been showed, can only be got by experience, from those objects, which are proper to produce in us those perceptions. When by this means we have our minds stored with them, and know the names for them, then we are in a condition to define, and by definition to understand the names of complex ideas, that are made up of them. But when any term stands for a simple idea, that a man has never yet had in his mind, 'tis impossible, by any words, to make known its meaning to him. When any term stands for an idea a man is acquainted with, but is ignorant, that that term is the sign of it, then another name of the same idea which he has been accustomed to, may make him understand its meaning. But in no case whatsoever, is any name, of any simple idea, capable of a definition.

§15. Names of simple ideas least doubtful. Fourthly, But though the names of simple ideas have not the help of definition to determine their signification; yet that hinders not but that they are generally less

doubtful and uncertain, than those of mixed modes and substances.

because they standing only for one simple perception, men, for the most part, easily and perfectly agree in their signification: and there is little room for mistake and wrangling about their meaning. He that knows once, that whiteness is the name of that colour he has observed in snow, or milk, will not be apt to misapply that word, as long as he retains that idea; which when he has quite lost, he is not apt to mistake the meaning of it, but perceives he understands it not.

There is neither a multiplicity of simple ideas to be put together, which makes the doubtfulness in the names of mixed modes: nor a supposed, but an unknown real essence, with properties depending thereon, the precise number whereof is also unknown, which makes the difficulty in the names of substances. But on the contrary, in simple ideas the whole signification of the name is known at once, and consists not of parts, whereof more or less being put in, the idea may be varied, and so the signification of its name, be obscure, or uncertain.

§16. Simple ideas have few ascents in *linea praedicamentali*. Fifthly, This further may be observed, concerning simple ideas, and their names, that they have but few ascents in *linea praedicamentali*, (as they call it,) from the lowest species, to the summum genus. The reason whereof is, that the lowest species being but one simple idea, nothing can be left out of it, that so the difference being taken away, it may agree with some other thing in one idea common to them both; which having one name, is the genus of the other two: v.g. there is nothing can be left out of the idea of white and red, to make them agree in one common appearance, and so have one general name; as rationality being left out of the complex idea of man, makes it agree with brute in the more general idea and name of animal. And therefore when to avoid unpleasant enumerations, men would comprehend both white and red, and several other such simple ideas, under one general name; they have been fain to do it by a word, which denotes only the way they get into the mind. For when white, red, and yellow, are all comprehended under the genus or name colour, it signifies no more, but such ideas, as are produced in the mind only by the sight, and have entrance only through the eyes. And when they would frame yet a more general term, to comprehend both colours and sounds, and the like simple ideas, they do it by a word,

that signifies all such as come into the mind only by one sense: and so the general term quality, in its ordinary acceptation, comprehends colours, sounds, tastes, smells, and tangible qualities, with distinction from extension, number, motion, pleasure, and pain, which make impressions on the mind, and introduce their ideas by more senses than one.

§17. Names of simple ideas stand for ideas not at all arbitrary. Sixthly, The names of simple ideas, substances, and mixed modes, have also this difference; that those of mixed modes stand for ideas perfectly arbitrary; those of substances, are not perfectly so, but refer to a pattern, though with some latitude: and those of simple ideas are perfectly taken from the existence of things, and are not arbitrary at all. Which what difference it makes in the significations of their names, we shall see in the following chapters.

The names of simple modes, differ little from those of simple ideas.

Chapter V Of the Names of Mixed Modes and Relations

§1. They stand for abstract ideas, as other general names. The names of mixed modes being general, they stand, as has been shewed, for sorts or species of things, each of which has its peculiar essence. The essences of these species also, as has been shewed, are nothing but the abstract ideas in the mind, to which the name is annexed. Thus far the names and essences of mixed modes, have nothing but what is common to them with other ideas: but if we take a little nearer survey of them, we shall find, that they have something peculiar, which, perhaps, may deserve our attention.

§2. First, the ideas they stand for, are made by the understanding. The first particularity I shall observe in them, is, that the abstract ideas, or, if you please, the essences of the several species of mixed modes are made by the understanding, wherein they differ from those of simple ideas: in which sort, the mind has no power to make any one, but only receives such as are presented to it, by the real existence of things operating upon it.

§3. Secondly, made arbitrarily, and without patterns. In the next

place, these essences of the species of mixed modes, are not only made by the mind, but made very arbitrarily, made without patterns, or reference to any real existence. Wherein they differ from those of substances, which carry with them the supposition of some real being, from which they are taken, and to which they are conformable. But in its complex ideas of mixed modes, the mind takes a liberty not to follow the existence of things exactly. It unites and retains certain collections, as so many distinct specific ideas, whilst others, that as often occur in nature, and are as plainly suggested by outward things, pass neglected without particular names or specifications. Nor does the mind, in these of mixed modes, as in the complex idea of substances, examine them by the real existence of things; or verify them by patterns, containing such peculiar compositions in nature. To know whether his idea of adultery, or incest, be right, will a man seek it anywhere amongst things existing? Or is it true, because any one has been witness to such an action? No: but it suffices here, that men have put together such a collection into one complex idea, that makes the archetype, and specific idea, whether ever any such action were committed in *rerum natura*, or no.

§4. How this is done. To understand this right, we must consider wherein this making of these complex ideas consists; and that is not in the making any new idea, but putting together those which the mind had before. Wherein the mind does these three things: first, it chooses a certain number. Secondly, it gives them connexion, and makes them into one idea. Thirdly, it ties them together by a name. If we examine how the mind proceeds in these, and what liberty it takes in them, we shall easily observe, how these essences of the species of mixed modes, are the workmanship of the mind; and consequently, that the species themselves are of men's making.

§5. Evidently arbitrary, in that the idea is often before the existence. Nobody can doubt, but that these ideas of mixed modes, are made by a voluntary collection of ideas put together in the mind, independent from any original patterns in nature, who will but reflect, that this sort of complex ideas may be made, abstracted, and have names given them, and so a species be constituted, before any one individual of that species ever existed. Who can doubt, but the ideas of sacrilege, or adultery, might be framed in the minds of men, and have names given them; and so these species of mixed modes be constituted, before either of them was ever committed; and might

be as well discoursed of, and reasoned about, and as certain truths discovered of them, whilst yet they had no being but in the understanding, as well as now, that they have but too frequently a real existence' Whereby 'tis plain, how much the sorts of mixed modes are the creatures of the understanding, where they have a being as subservient to all the ends of real truth and knowledge, as when they really exist: and we cannot doubt, but law-makers have often made laws about species of actions, which were only the creatures of their own understandings; beings that had no other existence, but in their own minds. And, I think, nobody can deny, but that the resurrection was a species of mixed modes in the mind, before it really existed.

§6. Instances murder, incest, stabbing. To see how arbitrarily these essences of mixed modes are made by the mind, we need but take a view of almost any of them. A little looking into them, will satisfy us, that 'tis the mind, that combines several scattered independent ideas, into one complex one; and by the common name it gives them, makes them the essence of a certain species, without regulating itself by any connexion they have in nature. For what greater connexion in nature, has the idea of a man, than the idea of a sheep, with killing, that this is made a particular species of action, signified by the word murder, and the other not' Or what union is there in nature, between the idea of the relation of a father, with killing, than that of a son, or neighbour; that those are combined into one complex idea, and thereby made the essence of the distinct species parricide, whilst the other makes no distinct species at all' But though they have made killing a man's father, or mother, a distinct species from killing his son, or daughter; yet in some other cases, son and daughter are taken in too, as well as father and mother: and they are all equally comprehended in the same species, as in that of incest. Thus the mind in mixed modes arbitrarily unites into complex ideas, such as it finds convenient; whilst others that have altogether as much union in nature, are left loose, and never combined into one idea, because they have no need of one name. 'Tis evident then, that the mind, by its free choice, gives a connexion to a certain number of ideas; which in nature have no more union with one another, than others that it leaves out: why else is the part of the weapon, the beginning of the wound is made with, taken notice of, to make the distinct species called stabbing, and the figure and matter of the weapon left out' I do not say, this is done without reason, as we shall see more by and by; but this I say, that 'tis done, by the free choice of

the mind, pursuing its own ends; and that therefore these species of mixed modes, are the workmanship of the understanding: and there is nothing more evident, than that for the most part, in the framing these ideas, the mind searches not its patterns in nature, nor refers the ideas it makes to the real existence of things; but puts such together, as may best serve its own purposes, without tying itself to a precise imitation of anything that really exists.

§7. But still subservient to the end of language. But though these complex ideas, or essences of mixed modes, depend on the mind, and are made by it with great liberty; yet they are not made at random, and jumbled together without any reason at all. Though these complex ideas be not always copied from nature, yet they are always suited to the end for which abstract ideas are made: and though they be combinations made of ideas, that are loose enough, and have as little union in themselves, as several other, to which the mind never gives a connexion that combines them into one idea; yet they are always made for the convenience of communication, which is the chief end of language. The use of language is, by short sounds to signify with ease and dispatch general conceptions; wherein not only abundance of particulars may be contained, but also a great variety of independent ideas collected into one complex one. In the making therefore of the species of mixed modes, men have had regard only to such combinations, as they had occasion to mention one to another. Those they have combined into distinct complex ideas, and given names to; whilst others that in nature have as near a union, are left loose and unregarded. For to go no further than human actions themselves, if they would make distinct abstract ideas, of all the varieties might be observed in them, the number must be infinite, and the memory confounded with the plenty, as well as overcharged to little purpose. It suffices, that men make and name so many complex ideas of these mixed modes, as they find they have occasion to have names for, in the ordinary occurrence of their affairs. If they join to the idea of killing, the idea of father, or mother, and so make a distinct species from killing a man's son, or neighbour, 'tis because of the different heinousness of the crime, and the distinct punishment is due to the murdering a man's father and mother different from what ought to be inflicted on the murderer of a son or neighbour; and therefore they find it necessary to mention it by a distinct name, which is the end of making that distinct combination. But though the ideas of mother and daughter, are so differently treated, in reference to the

idea of killing, that the one is joined with it, to make a distinct abstract idea with a name, and so a distinct species, and the other not; yet in respect of carnal knowledge, they are both taken in under incest: and that still for the same convenience of expressing under one name, and reckoning of one species, such unclean mixtures, as have a peculiar turpitude beyond others; and this to avoid circumlocutions, and tedious descriptions.

§8. Whereof the intranslatable words of divers languages are a proof. A moderate skill in different languages, will easily satisfy one of the truth of this, it being so obvious to observe great store of words in one language, which have not any that answer them in another. Which plainly shows, that those of one country, by their customs and manner of life, have found occasion to make several complex ideas, and given names to them, which others never collected into specific ideas. This could not have happened, if these species were the steady workmanship of nature; and not collections made and abstracted by the mind, in order to naming, and for the convenience of communication. The terms of our law, which are not empty sounds, will hardly find words that answer them in the Spanish or Italian, no scanty languages; much less, I think, could anyone translate them into the Caribbee, or Westoe tongues: and the versura of the Romans, or corban of the Jews, have no words in other languages to answer them; the reason whereof is plain, from what has been said. Nay, if we look a little more nearly into this matter, and exactly compare different languages, we shall find, that though they have words, which in translations and dictionaries, are supposed to answer one another; yet there is scarce one of ten, amongst the names of complex ideas, especially of mixed modes, that stands for the same precise idea, which the word does that in dictionaries 'tis rendered by. There are no ideas more common, and less compounded, than the measures of time, extension. and weight, and the Latin names hora, pes, libra, are without difficulty, rendered by the English names, hour, foot, and pound: but yet there is nothing more evident, than that the ideas a Roman annexed to these Latin names, were very far different from those which an Englishman expresses by those English ones. And if either of these should make use of the measures that those of the other language designed by their names, he would be quite out in his account. These are too sensible proofs to be doubted; and we shall find this much more so, in the names of more abstract and compounded ideas; such as are the greatest part of those which make up moral

discourses: whose names, when men come curiously to compare, with those they are translated into, in other languages, they will find very few of them exactly to correspond in the whole extent of their significations.

§9. This shows species to be made for communication. The reason why I take so particular notice of this, is, that we may not be mistaken about genera, and species, and their essences, as if they were things regularly and constantly made by nature, and had a real existence in things; when they appear, upon a more wary survey, to be nothing else but an artifice of the understanding, for the easier signifying such collections of ideas, as it should often have occasion to communicate by one general term; under which divers particulars, as far forth as they agreed to that abstract idea, might be comprehended. And if the doubtful signification of the word species, may make it sound harsh to some, that I say that the species of mixed modes are made by the understanding; yet, I think, it can by nobody be denied, that 'tis the mind makes those abstract complex ideas, to which specific names are given. And if it be true, as it is, that the mind makes the patterns, for sorting and naming of things, I leave it to be considered, who makes the boundaries of the sort, or species; since with me species and sort have no other difference, than that of a Latin and English idiom.

§10. In mixed modes 'tis the name that ties the combination together, and makes it a species. The near relation that there is between species, essences, and their general name, at least in mixed modes, will further appear, when we consider, that 'tis the name that seems to preserve those essences, and give them their lasting duration. For the connexion between the loose parts of those complex ideas, being made by the mind, this union, which has no particular foundation in nature, would cease again, were there not something that did, as it were, hold it together, and keep the parts from scattering. Though therefore it be the mind that makes the collection, 'tis the name which is, as it were, the knot, that ties them fast together. What a vast variety of different ideas, does the word triumphus hold together, and deliver to us as one species! Had this name been never made, or quite lost, we might, no doubt, have had descriptions of what passed in that solemnity: but yet, I think, that which holds those different parts together, in the unity of one complex idea, is that very word annexed to it: without which, the several parts of that, would no more be thought to make one thing, than any other

show, which having never been made but once, had never been united into one complex idea, under one denomination. How much therefore, in mixed modes, the unity necessary to any essence, depends on the mind; and how much the continuation and fixing of that unity, depends on the name in common use annexed to it, I leave to be considered by those, who look upon essences and species as real established things in nature.

§11. Suitable to this, we find, that men speaking of mixed modes, seldom imagine or take any other for species of them, but such as are set out by name: because they being of man's making only, in order to naming, no such species are taken notice of, or supposed to be, unless a name be joined to it, as the sign of man's having combined into one idea several loose ones; and by that name, giving a lasting union to the parts, which would otherwise cease to have any, as soon as the mind laid by that abstract idea, and ceased actually to think on it. But when a name is once annexed to it, wherein the parts of that complex idea have a settled and permanent union; then is the essence, as it were established, and the species looked on as complete. For to what purpose should the memory charge itself with such compositions, unless it were by abstraction to make them general? And to what purpose make them general, unless it were, that they might have general names, for the convenience of discourse, and communication? Thus we see, that killing a man with a sword, or a hatchet, are looked on as no distinct species of action: but if the point of the sword first enter the body, it passes for a distinct species, where it has a distinct name, as in England, in whose language 'tis called stabbing: but in another country, where it has not happened to be specified under a peculiar name, it passes not for a distinct species. But in the species of corporeal substances, though it be the mind that makes the nominal essence: yet since those ideas, which are combined in it, are supposed to have an union in nature, whether the mind joins them or no, therefore those are looked on as distinct species, without any operation of the mind, either abstracting, or giving a name to that complex idea.

§12. For the originals of mixed modes, we look no further than the mind, which also shows them to be the workmanship of the understanding. Conformable also to what has been said, concerning the essences of the species of mixed modes, that they are the creatures of the understanding, rather than the works of nature: conformable, I

say, to this, we find, that their names lead our thoughts to the mind, and no further. When we speak of justice, or gratitude, we frame to ourselves no imagination of anything existing, which we would conceive; but our thoughts terminate in the abstract ideas of those virtues, and look not further; as they do, when we speak of a horse, or iron, whose specific ideas we consider not, as barely in the mind, but as in things themselves, which afford the original patterns of those ideas. But in mixed modes, at least the most considerable parts of them, which are moral beings, we consider the original patterns, as being in the mind; and to those we refer for the distinguishing of particular beings under names. And hence I think 'tis, that these essences of the species of mixed modes, are by a more particular name called notions; as by a peculiar right, appertaining to the understanding.

§13. Their being made by the understanding without patterns, shows the reason why they are so compounded.

Hence, likewise we may learn, why the complex ideas of mixed modes, are commonly more compounded and decompounded, than those of natural substances. Because they being the workmanship of the understanding, pursuing only its own ends, and the conveniency of expressing in short those ideas it would make known to another, it does with great liberty unite often into one abstract idea things that in their nature have no coherence; and so under one term, bundle together a great variety of compounded, and decompounded ideas.

Thus the name of procession, what a great mixture of independent ideas of persons, habits, tapers, orders, motions, sounds, does it contain in that complex one, which the mind of man has arbitrarily put together, to express by that one name. Whereas the complex ideas of the sorts of substances, are usually made up of only a small number of simple ones; and in the species of animals, these two, viz. shape and voice, commonly make the whole nominal essence.

§14. Names of mixed modes stand always for their real essences. Another thing we may observe from what has been said, is, That the names of mixed modes always signify (when they have any determined signification) the real essences of their species. For these abstract ideas, being the workmanship of the mind, and not referred to the real existence of things, there is no supposition of anything more signified by that name, but barely that complex idea, the mind

itself has formed, which is all it would have expressed by it; and is that, on which all the properties of the species depend and from which alone they all flow: and so in these the real and nominal essence is the same; which of what concernment 'tis to the certain knowledge of general truth, we shall see hereafter.

§15. Why their names are usually got before their ideas. This also may show us the reason, why for the most part the names of fixed modes are got, before the ideas they stand for are perfectly known. Because there being no species of these ordinarily taken notice of, but what have names; and those species, or rather their essences, being abstract complex ideas made arbitrarily by the mind, 'tis convenient, if not necessary, to know the names, before one endeavour to frame these complex ideas: unless a man will fill his head with a company of abstract complex ideas, which others having no names for, he has nothing to do with, but to lay by, and forget again. I confess, that in the beginning of languages, it was necessary to have the idea, before one gave it the name: and so 'tis still, where making a new complex idea, one also, by giving it a new name, makes a new word. But this concerns not languages made, which have generally pretty well provided for ideas, which men have frequent occasion to have, and communicate; and in such, I ask, whether it be not the ordinary method, that children learn the names of mixed modes, before they have their ideas? What one of a thousand ever frames the abstract ideas of glory or ambition before he has heard the names of them. In simple ideas and substances, I grant 'tis otherwise; which being such ideas, as have a real existence and union in nature, the ideas, or names, are got one before the other, as it happens.

§16. Reason of my being so large on this subject. What has been said here of mixed modes, is with very little difference applicable also to relations; which since every man himself may observe, I may spare myself the pains to enlarge on: especially, since what I have here said concerning words in this third book, will possibly be thought by some to be much more than what so slight a subject required. I allow, it might be brought into a narrower compass: but I was willing to stay my reader on an argument, that appears to me new, and a little out of the way, (I am sure 'tis one, I thought not of, when I began to write,) that by searching it to the bottom, and turning it on every side, some part or other might meet with every one's thoughts, and give occasion to the most averse, or negligent, to reflect on a general miscarriage;

which, though of great consequence, is little taken notice of. When 'tis considered, what a pudder is made about essences, and how much all sorts of knowledge, discourse, and conversation, are pestered and disordered by the careless, and confused use and application of words, it will perhaps, be thought worth while thoroughly to lay it open. And I shall be pardoned, if I have dwelt long on an argument, which I think therefore needs to be inculcated; because the faults men are usually guilty of in this kind, are not only the greatest hindrances of true knowledge; but are so well thought of, as to pass for it. Men would often see what a small pittance of reason and truth, or possibly none at all, is mixed with those huffing opinions they are swelled with; if they would look beyond fashionable sounds, and observe what ideas are, or are not comprehended under those words, with which they are so armed at all points, and with which they so confidently lay about them. I shall imagine I have done some service to truth, peace, and learning, if, by any enlargement on this subject, I can make men reflect on their own use of language; and give them reason to suspect, that since 'tis frequent for others, it may also be possible for them, to have sometimes very good and approved words in their mouths, and writings, with very uncertain, little, or no signification. And therefore 'tis not unreasonable for them to be wary herein themselves, and not to be unwilling to have them examined by others. With this design therefore, I shall go on with what I have further to say, concerning this matter.

Chapter VI Of the Names of Substances

§1. The common names of substances stand for sorts. The common names of substances, as well as other general terms, stand for sorts: which is nothing else but the being made signs of such complex ideas, wherein several particular substances do, or might agree, by virtue of which, they are capable of being comprehended in one common conception, and signified by one name. I say, do or might agree: for though there be but one sun existing in the world, yet the idea of it being abstracted, so that more substances (if there were several) might each agree in it; 'tis as much a sort, as if there were as many suns as there are stars. They want not their reasons, who think there are, and that each fixed star, would answer the idea the name sun stands for, to one who was placed in a due distance; which, by the way, may show us how much the sorts, or, if you please, genera and species of things (for those Latin terms signify to me, no more than the English word sort) depend on such collections of ideas, as men have made; and not on the real nature of things: since 'tis not impossible, but that in propriety of speech, that might be a Sun to one, which is a star to another.

§2. The essence of each sort is the abstract idea. The measure and boundary of each sort, or species, whereby 'tis constituted that particular sort, and distinguished from others, is that we call its essence, which is nothing but that abstract idea to which the name is annexed: so that everything contained in that idea, is essential to that sort. This, though it be all the essence of natural substances, that we know, or by which we distinguish them into sorts yet I call it by a peculiar name, the nominal essence, to distinguish it from the real constitution of substances, upon which depends this nominal essence, and all the properties of that sort; which therefore, as has been said, may be called the real essence: v.g. the nominal essence of gold, is that complex idea the word gold stands for, let it be, for instance, a body yellow, of a certain weight, malleable, fusible, and fixed. But the real essence is the constitution of the insensible parts of that body, on which those qualities, and all the other properties of gold depend. How far these two are different, though they are both called essence, is obvious, at first sight, to discover.

§3. The nominal and real essence different. For though,

perhaps, voluntary motion, with sense and reason, joined to a body of a certain shape, be the complex idea, to which I, and others, annex the name man; and so be the nominal essence of the species so called: yet nobody will say, that that complex idea is the real essence and source of all those operations, which are to be found in any individual of that sort. The foundation of all those qualities, which are the ingredients of our complex idea, is something quite different: and had we such a knowledge of that constitution of man, from which his faculties of moving, sensation, and reasoning, and other powers flow; and on which his so regular shape depends, as 'tis possible angels have, and 'tis certain his Maker has, we should have a quite other idea of his essence, than what now is contained in our definition of that species, be it what it will: and our idea of any individual man would be as far different from what it now is, as is his, who knows all the springs and wheels, and other contrivances within, of the famous clock at Strasburg, from that which a gazing countryman has of it, who barely sees the motion of the hand, and hears the clock strike, and observes only some of the outward appearances.

§4. Nothing essential to individuals. That essence, in the ordinary use of the word, relates to sorts, and that 'tis considered in particular beings, no further than as they are ranked into sorts, appears from hence: that take but away the abstract ideas, by which we sort individuals, and rank them under common names, and then the thought of anything essential to any of them, instantly vanishes: we have no notion of the one, without the other: which plainly shows their relation. 'Tis necessary for me to be as I am; God and nature has made me so: but there is nothing I have, is essential to me. An accident, or disease, may very much alter my colour, or shape; a fever, or fall, may take away my reason, or memory, or both; and an apoplexy leave neither sense, nor understanding, nor life. Other creatures of my shape, may be made with more, and better, or fewer and worse faculties than I have: and others may have reason and sense in a shape and body very different from mine. None of these are essential to the one, or the other, or to any individual whatsoever, till the mind refers it to some sort or species of things; and then presently, according to the abstract idea of that sort, something is found essential. Let any one examine his own thoughts, and he will find, that as soon as he supposes or speaks of essential, the consideration of some species, or the complex idea, signified by some general name, comes into his mind: and 'tis in reference to that, that this or that quality is

said to be essential. So that if it be asked, whether it be essential to me, or any other particular corporeal being to have reason' I say no; no more than 'tis essential to this white thing I write on, to have words in it. But if that particular being be to be counted of the sort man, and to have the name man given it, then reason is essential to it, supposing reason to be a part of the complex idea the name man stands for: as 'tis essential to this thing I write on to contain words, if I will give it the name treatise, and rank it under that species. So that essential, and not essential, relate only to our abstract ideas, and the names annexed to them; which amounts to no more than this, that whatever particular thing, has not in it those qualities, which are contained in the abstract idea, which any general term stands for, cannot be ranked under that species, nor be called by that name, since that abstract idea is the very essence of that species.

§5. The only essences perceived by us in individual substances are those qualities which entitle them to receive their names. Thus if the idea of body, with some people, be bare extension or space, then solidity is not essential to body: if others make the idea, to which they give the name body, to be solidity and extension, then solidity is essential to body. That therefore, and that alone is considered as essential, which makes a part of the complex idea the name of a sort stands for, without which, no particular thing can be reckoned of that sort, nor be entitled to that name. Should there be found a parcel of matter, that had all the other qualities that are in iron, but wanted obedience to the loadstone; and would neither be drawn by it nor receive direction from it, would anyone question, whether it wanted anything essential' It would be absurd to ask, Whether a thing really existing, wanted anything essential to it. Or could it be demanded, Whether this made an essential or specific difference, or no; since we have no other measure of essential or specific, but our abstract ideas' And to talk of specific differences in nature, without reference to general ideas in names, is to talk unintelligibly. For I would ask any one, What is sufficient to make an essential difference in nature, between any two particular beings, without any regard had to some abstract idea, which is looked upon as the essence and standard of a species' All such patterns and standards, being quite laid aside, particular beings, considered barely in themselves, will be found to have all their qualities equally essential; and everything in each individual, will be essential to it, or, which is more, nothing at all. For though it may be reasonable to ask, Whether obeying the magnet, be

essential to iron' yet, I think, 'tis very improper and insignificant to ask, whether it be essential to the particular parcel of matter I cut my pen with, without considering it under the name iron, or as being of a certain species' And if, as has been said, our abstract ideas, which have names annexed to them, are the boundaries of species, nothing can be essential but what is contained in those ideas.

§6. Even the real essences of individual substances imply potential sorts. 'Tis true, I have often mentioned a real essence, distinct in substances, from those abstract ideas of them, which I call their nominal essence. By this real essence, I mean, that real constitution of anything, which is the foundation of all those properties, that are combined in, and are constantly found to co-exist with the nominal essence; that particular constitution, which everything has within itself, without any relation to anything without it. But essence, even in this sense, relates to a sort, and supposes a species: for being that real constitution, on which the properties depend, it necessarily supposes a sort of things, properties belonging only to species, and not to individuals; v.g. supposing the nominal essence of gold, to be a body of such a peculiar colour and weight, with malleability and fusibility, the real essence is that constitution of the parts of matter, on which these qualities, and their union, depend; and is also the foundation of its solubility in aqua regia, and other properties accompanying that complex idea. Here are essences and properties, but all upon supposition of a sort, or general abstract idea, which is considered as immutable: but there is no individual parcel of matter, to which any of these qualities are so annexed, as to be essential to it, or inseparable from it. That which is essential, belongs to it as a condition, whereby 'tis of this or that sort: but take away the consideration of its being ranked under the name of some abstract idea, and then there is nothing necessary to it, nothing inseparable from it. Indeed, as to the real essences of substances, we only suppose their being, without precisely knowing what they are: but that which annexes them still to the species, is the nominal essence, of which they are the supposed foundation and cause.

§7. The nominal essence bounds the species. The next thing to be considered is, by which of those essences 'tis, that substances are determined into sorts, or species; and that 'tis evident, is by the nominal essence. For 'tis that alone, that the name, which is the mark of the sort, signifies. 'Tis impossible therefore, that anything should

determine the sorts of things, which we rank under general names, but that idea, which that name is designed as a mark for; which is that, as has been shown, which we call the nominal essence. Why do we say, this is a horse, and that a mule; this is an animal, that an herb? How comes any particular thing to be of this or that sort, but because it has that nominal essence, or, which is all one, agrees to that abstract idea, that name is annexed to? And I desire any one but to reflect on his own thoughts, when he hears or speaks any of those, or other names of substances, to know what sort of essences they stand for.

§8. The nature of species, as formed by us. And that the species of things to us, are nothing but the ranking them under distinct names, according to the complex ideas in us; and not according to precise, distinct, real essences in them, is plain from hence, that we find many of the individuals that are ranked into one sort, called by one common name, and so received as being of one species, have yet qualities depending on their real constitutions, as far different one from another, as from others, from which they are accounted to differ specifically. This, as 'tis easy to be observed by all, who have to do with natural bodies; so chemists especially are often, by sad experience, convinced of it, when they, sometimes in vain, seek for the same qualities in one parcel of sulphur, antimony, or vitriol, which they have found in others. For though they are bodies of the same species, having the same nominal essence, under the same name; yet do they often, upon severe ways of examination, betray qualities so different one from another, as to frustrate the expectation and labour of very wary chemists. But if things were distinguished into species, according to their real essences, it would be as impossible to find different properties in any two individual substances of the same species, as 'tis to find different properties in two circles, or two equilateral triangles. That is properly the essence to us, which determines every particular to this or that class; or, which is the same thing, to this or that general name: and what can that be else, but that abstract idea, to which that name is annexed? and so has, in truth, a reference, not so much to the being of particular things, as to their general denominations.

§9. Not the real essence which we know not. Nor indeed can we rank, and sort things, and consequently (which is the end of sorting) denominate them by their real essences, because we know them not. Our faculties carry us no further towards the knowledge and

distinction of substances, than a collection of those sensible ideas, which we observe in them; which however made with the greatest diligence and exactness, we are capable of, yet is more remote from the true internal constitution, from which those qualities flow, than, as I said, a countryman's idea is from the inward contrivance of that famous clock at Strasburg, whereof he only sees the outward figure and motions. There is not so contemptible a plant or animal, that does not confound the most enlarged understanding. Though the familiar use of things about us, take off our wonder; yet it cures not our ignorance. When we come to examine the stones, we tread on; or the iron, we daily handle, we presently find, we know not their make; and can give no reason, of the different qualities we find in them. 'Tis evident the internal constitution, whereon their properties depend, is unknown to us for to go no further than the grossest and most obvious we can imagine amongst them, what is that texture of parts, that real essence, that makes lead and antimony fusible; wood and stones not? What makes lead, and iron malleable; antimony and stones not? And yet how infinitely these come short, of the fine contrivances, and inconceivable real essences of plants or animals, everyone knows. The workmanship of the all-wise, and powerful God, in the great fabric of the universe, and every part thereof, further exceeds the capacity and comprehension of the most inquisitive and intelligent man, than the best contrivance of the most ingenious man, doth the conceptions of the most ignorant of rational creatures. Therefore we in vain pretend to range things into sorts, and dispose them into certain classes, under names, by their real essences, that are so far from our discovery or comprehension. A blind man may as soon sort things by their colours, and he that has lost his smell, as well distinguish a lily and a rose by their odours, as by those internal constitutions which he knows not. He that thinks he can distinguish sheep and goats by their real essences, that are unknown to him, may be pleased to try his skill in those species, called cassiowary, and querechinchio; and by their internal real essences, determine the boundaries of those species, without knowing the complex idea of sensible qualities, that each of those names stand for, in the countries where those animals are to be found.

§10. Not substantial forms, which we know less. Those, therefore who have been taught, that the several species of substances had their distinct internal substantial forms; and that it was those forms, which made the distinction of substances into their true species and genera,

were led yet further out of the way, by having their minds set upon fruitless inquiries after substantial forms, wholly unintelligible, and whereof we have scarce so much as any obscure, or confused conception in general.

§11. That the nominal essence is that whereby we distinguish species, further evident from spirits. That our ranking, and distinguishing natural substances into species consists in the nominal essences, the mind makes, and not in the real essences to be found in the things themselves, is further evident from our ideas of spirits. For the mind getting, only by reflecting on its own operations, those simple ideas which it attributes to spirits, it hath, or can have no other notion of spirit, but by attributing all those operations, it finds in itself, to a sort of beings, without consideration of matter. And even the most advanced notion we have of God, is but attributing the same simple ideas which we have got from reflection on what we find in ourselves, and which we conceive to have more perfection in them, than would be in their absence; attributing, I say, those simple ideas to him in an unlimited degree. Thus having got from reflecting on ourselves, the idea of existence, knowledge, power, and pleasure, each of which we find it better to have than to want; and the more we have of each, the better; joining all these together, with infinity to each of them, we have the complex idea of an eternal, omniscient, omnipotent, infinitely wise and happy being. And though we are told, that there are different species of angels; yet we know not how to frame distinct specific ideas of them; not out of any conceit, that the existence of more species, than one of spirits is impossible; but because having no more simple ideas (nor being able to frame more) applicable to such beings, but only those few, taken from ourselves, and from the actions of our own minds in thinking, and being delighted, and moving several parts of our bodies; we can no otherwise distinguish in our conceptions the several species of spirits, one from another, but by attributing those operations and powers, we find in ourselves, to them in a higher or lower degree; and so have no very distinct specific ideas of spirits, except only of God, to whom we attribute both duration, and all those other ideas with infinity; to the other spirits, with limitation: nor as I humbly conceive do we, between God and them in our ideas, put any difference by any number of simple ideas, which we have of one, and not of the other, but only that of infinity. All the particular ideas of existence, knowledge, will, power, and motion, etc. being ideas derived from the

operations of our minds, we attribute all of them to all sorts of spirits, with the difference only of degrees, to the utmost we can imagine, even infinity, when we would frame, as well as we can, an idea of the first being; who yet, 'tis certain, is infinitely more remote in the real excellency of his nature, from the highest and perfectest of all created beings, than the greatest man, nay, purest seraph, is from the most contemptible part of matter; and consequently must infinitely exceed what our narrow understandings can conceive of him.

§12. Where of there are probably numberless species. 'Tis not impossible to conceive, nor repugnant to reason, that there may be many species of spirits, as much separated and diversified one from another, by distinct properties, whereof we have no ideas, as the species of sensible things are distinguished one from another, by qualities, which we know, and observe in them. That there should be more species of intelligent creatures above us, than there are of sensible and material below us, is probable to me from hence; that in all the visible corporeal world, we see no chasms, or gaps. All quite down from us, the descent is by easy steps, and a continued series of things, that in each remove, differ very little one from the other. There are fishes that have wings, and are not strangers to the airy region: and there are some birds, that are inhabitants of the water; whose blood is cold as fishes, and their flesh so like in taste; that the scrupulous are allowed them on fish-days. There are animals so near of kin both to birds and beasts, that they are in the middle between both: amphibious animals link the terrestrial and aquatic together; seals live at land and sea, and porpoises have the warm blood and entrails of a hog not to mention what is confidently reported of mermaids, or sea-men. There are some brutes, that seem to have as much knowledge and reason, as some that are called men: and the animal and vegetable kingdoms, are so nearly joined, that if you will take the lowest of one, and the highest of the other, there will scarce be perceived any great difference between them; and so on till we come to the lowest and the most inorganic parts of matter, we shall find everywhere, that the several species are linked together, and differ but in almost insensible degrees. And when we consider the infinite power and wisdom of the Maker, we have reason to think, that 'tis suitable to the magnificent harmony of the universe, and the great design and infinite goodness of the Architect, that the species of creatures should also, by gentle degrees, ascend upward from us toward his infinite perfection, as we see they gradually descend from

us downwards: which if it be probable, we have reason then to be persuaded, that there are far more species of creatures above us, than there are beneath; we being in degrees of perfection, much more remote from the infinite being of God, than we are from the lowest state of being, and that which approaches nearest to nothing. And yet of all those distinct species, for the reasons above-said, we have no clear distinct ideas.

§13. The nominal essence that of the species, proved from water and ice. But to return to the species of corporeal substances. If I should ask any one, whether ice and water were two distinct species of things, I doubt not but I should be answered in the affirmative: and it cannot be denied, but he that says they are two distinct species, is in the right. But if an Englishman, bred in Jamaica, who, perhaps, had never seen nor heard of ice, coming into England in the winter, find, the water he put in his basin at night, in a great part frozen in the morning; and not knowing any peculiar name it had, should call it hardened water; I ask, whether this would be a new species to him, different from water? And, I think, it would be answered here, It would not to him be a new species, no more than congealed jelly, when 'tis cold, is a distinct species, from the same jelly fluid and warm; or than liquid gold, in the furnace, is a distinct species from hard gold in the hands of a workman. And if this be so, 'tis plain, that our distinct species, are nothing but distinct complex ideas, with distinct names annexed to them. 'Tis true, every substance that exists, has its peculiar constitution, whereon depend those sensible qualities, and powers, we observe in it: but the ranking of things into species, which is nothing but sorting them under several titles, is done by us, according to the ideas that we have of them: which though sufficient to distinguish them by names; so that we may be able to discourse of them, when we have them not present before us; yet if we suppose it to be done by their real internal constitutions, and that things existing are distinguished by nature into species, by real essences, according as we distinguish them into species by names, we shall be liable to great mistakes.

§14. Difficulties against a certain number of real essences. To distinguish substantial beings into species, according to the usual supposition, that there are certain precise essences or forms of things, whereby all the individuals existing, are, by nature distinguished into species, these things are necessary: §15. A crude

supposition. First, to be assured, that nature, in the production of things, always designs them to partake of certain regulated established essences, which are to be the models of all things to be produced. This, in that crude sense, 'tis usually proposed, would need some better explication, before it can fully be assented to.

§16. Monstrous births. Secondly, it would be necessary to know, whether nature always attains that essence, it designs in the production of things. The irregular and monstrous births, that in divers sorts of animals have been observed, will always give us reason to doubt of one, or both of these.

§17. Are monsters really a distinct species? Thirdly, it ought to be determined, whether those we call monsters, be really a distinct species, according to the scholastic notion of the word species; since 'tis certain, that everything that exists, has its particular constitution. And yet we find, that some of these monstrous productions, have few or none of those qualities, which are supposed to result from, and accompany the essence of that species, from whence they derive their originals, and to which, by their descent, they seem to belong.

§18. Men can have no ideas of real essences. Fourthly, the real essences of those things, which we distinguish into species, and as so distinguished we name, ought to be known; i.e. we ought to have ideas of them. But since we are ignorant in these four points, the supposed real essences of things, stand us not in stead for the distinguishing substances into species.

§19. Our nominal essences of substances, not perfect collections of properties. Fifthly, the only imaginable help in this case would be, that having framed perfect complex ideas of the properties of things, flowing from their different real essences, we should thereby distinguish them into species. But neither can this be done: for being ignorant of the real essence itself, 'tis impossible to know all those properties, that flow from it, and are so annexed to it, that any one of them being away, we may certainly conclude, that the essence is not there, and so the thing is not of that species. We can never know what are the precise number of properties depending on the real essence of gold, any one of which failing, the real essence of gold, and consequently gold, would not be there, unless we knew the real essence of gold itself, and by that determined that species. By the

word gold here, I must be understood to design a particular piece of matter; v.g. the last guinea that was coined. For if it should stand here in its ordinary signification for that complex idea, which I, or anyone else calls gold; i.e. for the nominal essence of gold, it would be jargon: So hard is it, to show the various meaning and imperfection of words, when we have nothing else but words to do it by.

§20. Hence names independent of real essences. By all which 'tis clear, that our distinguishing substances into species by names, is not at all founded on their real essences; nor can we pretend to range and determine them exactly into species, according to internal essential differences.

§21. But such a collection as our names stand for. But since, as has been remarked, we have need of general words, though we know not the real essences of things; all we can do, is to collect such a number of simple ideas, as by examination, we find to be united together in things existing, and thereof to make one complex idea. Which though it be not the real essence of any substance that exists, is yet the specific essence, to which our name belongs, and is convertible with it; by which we may at least try the truth of these nominal essences. For example, there be that say, that the essence of body is extension: if it be so, we can never mistake in putting the essence of anything for the thing itself. Let us then in discourse, put extension for body; and when we would say, that body moves, let us say, that extension moves, and see how it will look. He that should say, that one extension, by impulse moves another extension, would, by the bare expression, sufficiently show the absurdity of such a notion. The essence of anything, in respect of us, is the whole complex idea, comprehended and marked by that name; and in substances, besides the several distinct simple ideas that make them up, the confused one of substance, or of an unknown support and cause of their union, is always a part: and therefore the essence of body is not bare extension, but an extended solid thing; and so to say, an extended solid thing moves, or impels another, is all one, and as intelligible, as to say, body moves, or impels. Likewise, to say, that a rational animal is capable of conversation, is all one, as to say, a man. But no one will say, that rationality is capable of conversation, because it makes not the whole essence, to which we give the name man.

§22. Our abstract ideas are to us the measures of species, instance in that of man. There are creatures in the world, that have shapes like ours, but are hairy, and want language, and reason. There are naturals amongst us, that have perfectly our shape, but want reason, and some of them language too. There are creatures, as 'tis said, (*sit fides penes authorem*, but there appears no contradiction, that there should be such) that with language, and reason, and a shape in other things agreeing with ours, have hairy tails; others where the males have no beards, and others where the females have. If it be asked, whether these be all men, or no, all of human species; 'tis plain, the question refers only to the nominal essence: for those of them to whom the definition of the word man, or the complex idea signified by the name, agrees, are men, and the other not. But if the inquiry be made concerning the supposed real essence; and whether the internal constitution and frame of these several creatures be specifically different, 'tis wholly impossible for us to answer, no part of that going into our specific idea: only we have reason to think, that where the faculties, or outward frame so much differs, the internal constitution is not exactly the same: But, what difference in the internal real constitution makes a specific difference, 'tis in vain to inquire; whilst our measures of species be, as they are, only our abstract ideas, which we know; and not that internal constitution, which makes no part of them. Shall the difference of hair only on the skin, be a mark of a different internal specific constitution between a changeling and a drill, when they agree in shape, and want of reason and speech? And shall not the want of reason and speech, be a sign to us of different real constitutions and species between a changeling, and a reasonable man? And so of the rest, if we pretend, that distinction of species or sorts is fixedly established by the real frame, and secret constitutions of things.

§23. Species not distinguished by generation. Nor let any one say, that the power of propagation in animals by the mixture of male and female, and in plants by seeds, keeps the supposed real species distinct and entire. For granting this to be true, it would help us in the distinction of the species of things no further than the tribes of animals and vegetables. What must we do for the rest? But in those too 'tis not sufficient: for if history lie not, women have conceived by drills; and what real species, by that measure, such a production will be in nature, will be a new question; and we have reason to think this not impossible, since mules and jumarts, the one from the mixture of

an ass and a mare, the other from the mixture of a bull and a mare, are so frequent in the world. I once saw a creature, that was the issue of a cat and a rat, and had the plain marks of both about it; wherein nature appeared to have followed the pattern of neither sort alone, but to have jumbled them both together. To which, he that shall add the monstrous productions that are so frequently to be met with in nature, will find it hard, even in the race of animals, to determine by the pedigree of what species every animal's issue is; and be at a loss about the real essence, which he thinks certainly conveyed by generation, and has alone a right to the specific name. But further, if the species of animals and plants are to be distinguished only by propagation, must I go to the Indies to see the sire and dam of the one, and the plant from which the seed was gathered, that produced the other, to know whether this be a tiger or that tea'

§24. Not by substantial forms. Upon the whole matter, 'tis evident, that 'tis their own collections of sensible qualities, that men make the essences of their several sorts of substances; and that their real internal structures, are not considered by the greatest part of men, in the sorting them. Much less were any substantial forms ever thought on by any, but those who have in this one part of the world, learned the language of the schools: and yet those ignorant men, who pretend not any insight into the real essences, nor trouble themselves about substantial forms, but are content with knowing things one from another, by their sensible qualities, are often better acquainted with their differences; can more nicely distinguish them from their uses; and better know what they may expect from each, than those learned quick-sighted men, who look so deep into them, and talk so confidently of something more hidden and essential.

§25. The specific essences are made by the mind. But supposing that the real essences of substances were discoverable, by those, that would severely apply themselves to that inquiry; yet we could not reasonably think, that the ranking of things under general names, was regulated by those internal real constitutions, or anything else but their obvious appearances. since languages, in all countries, have been established long before sciences. So that they have not been philosophers, or logicians, or such who have troubled themselves about forms and essences, that have made the general names, that are in use amongst the several nations of men: but those, more or less comprehensive terms, have, for the most part, in all

languages, received their birth and signification, from ignorant and illiterate people, who sorted and denominated things, by those sensible qualities they found in them, thereby to signify them, when absent, to others, whether they had an occasion to mention a sort, or a particular thing.

§26. Therefore very various and uncertain. Since then 'tis evident, that we sort and name substances by their nominal, and not by their real essences, the next thing to be considered is, how, and by whom these essences come to be made. As to the latter, 'tis evident they are made by the mind, and not by nature: for were they nature's workmanship, they could not be so various and different in several men as experience tells us they are. For if we will examine it, we shall not find the nominal essence of any one species of substances, in all men the same; no not of that, which of all others we are the most intimately acquainted with. It could not possibly be, that the abstract idea, to which the name man is given, should be different in several men, if it were of nature's making; and that to one it should be animal rationale, and to another animal implume bipes latis unguibus. He that annexes the name man, to a complex idea, made up of sense and spontaneous motion, joined to a body of such a shape, has thereby one essence of the species man: and he that, upon further examination, adds rationality, has another essence of the species he calls man: by which means, the same individual will be a true man to the one, which is not so to the other. I think, there is scarce any, one will allow this upright figure, so well known, to be the essential difference of the species man; and yet how far men determine of the sorts of animals, rather by their shape, than descent, is very visible; since it has been more than once debated, whether several human foetuses should be preserved, or received to baptism, or no, only because of the difference of their outward configuration, from the ordinary make of children, without knowing whether they were not as capable of reason, as infants cast in another mould: some whereof, though of an approved shape, are never capable of as much appearance, of reason all their lives, as is to be found in an ape, or an elephant; and never give any signs of being acted by a rational soul. Whereby 'tis evident, that the outward figure, which only was found wanting, and not the faculty of reason, which nobody could know would be wanting in its due season, was made essential to the human species. The learned divine and lawyer, must, on such occasions, renounce his sacred definition of animal rationale, and substitute some other essence of

the human species. Monsieur Menage furnishes us with an example worth the taking notice of on this occasion. 'When the Abbot of St Martin,' says he, 'was born, he had so little of the figure of a man, that it bespoke him rather a monster. 'Twas for some time under deliberation, whether he should be baptized or no. However, he was baptized, and declared a man provisionally [till time should show what he would prove]. Nature had moulded him so untowardly, that he was called all his life the Abbot Malotru [i.e. illshaped]. He was of Caen' (Menagiana, 278/430). This child we see was very near being excluded out of the species of man, barely by his shape. He escaped very narrowly as he was, and 'tis certain a figure a little more oddly turned had cast him, and he had been executed as a thing not to be allowed to pass for a man. And yet there can be no reason given, why if the lineaments of his face had been a little altered, a rational soul could not have been lodged in him; why a visage somewhat longer, or a nose flatter, or a wider mouth could not have consisted, as well as the rest of his ill figure, with such a soul, such parts, as made him, disfigured as he was, capable to be a dignitary in the Church.

§27. Nominal essences of particular substances are undetermined by nature, and therefore various as men vary. Wherein then, would I gladly know, consist the precise and unmovable boundaries of that species? 'Tis plain, if we examine, there is no such thing made by nature, and established by her amongst men. The real essence of that, or any other sort of substances, 'tis evident we know not; and therefore are so undetermined in our nominal essences, which we make ourselves, that if several men were to be asked, concerning some oddly-shaped foetus, as soon as born, whether it were a man, or no, 'tis past doubt, one should meet with different answers. Which could not happen, if the nominal essences, whereby we limit and distinguish the species of substances, were not made by man, with some liberty; but were exactly copied from precise boundaries set by nature, whereby it distinguished all substances into certain species. Who would undertake to resolve, what species that monster was of, which is mentioned by Licetus, lib. i. c. 3. with a man's head and hog's body? Or those other which to the bodies of men, had the heads of beasts, as dogs, horses, etc. If any of these creatures had lived, and could have spoke, it would have increased the difficulty. Had the upper part, to the middle, been of human shape, and all below swine; had it been murder to destroy it? Or must the bishop have been consulted, whether it were man enough to be admitted to the font, or no? As I

have been told, it happened in France some years since, in somewhat a like case. So uncertain are the boundaries of species of animals to us, who have no other measures, than the complex ideas of our own collecting: and so far are we from certainly knowing what a man is; though, perhaps, it will be judged great ignorance to make any doubt about it. And yet, I think, I may say, that the certain boundaries of that species, are so far from being determined, and the precise number of simple ideas, which make the nominal essence so far from being settled, and perfectly known, that very material doubts may still arise about it: and I imagine none of the definitions of the word man, which we yet have, nor descriptions of that sort of animal, are so perfect and exact, as to satisfy a considerate inquisitive person; much less to obtain a general consent, and to be that which men would everywhere stick by, in the decision of cases, and determining of life and death, baptism or no baptism, in productions that might happen.

§28. But not so arbitrary as mixed modes. But though these nominal essences of substances are made by the mind, they are not yet made so arbitrarily, as those of mixed modes. To the making of any nominal essence, 'tis necessary, first, that the ideas whereof it consists have such a union as to make but one idea, how compounded soever. Secondly, that the particular ideas so united be exactly the same, neither more nor less. For if two abstract complex ideas, differ either in number or sorts, of their component parts, they make two different, and not one and the same essence. In the first of these, the mind, in making its complex ideas of substances, only follows nature; and puts none together, which are not supposed to have a union in nature. Nobody joins the voice of a sheep with the shape, of a horse; nor the colour of lead, with the weight and fixedness of gold, to be the complex ideas of any real substances; unless he has a mind to fill his head with chimeras, and his discourse with unintelligible words. Men observing certain qualities always joined and existing together, therein copied nature; and of ideas so united, made their complex ones of substances. For though men may make what complex ideas they please, and give what names to them they will; yet if they will be understood, when they speak of things really existing, they must, in some degree, conform their ideas to the things they would speak of: or else men's language will be like that of Babel; and every man's words, being intelligible only to himself, would no longer serve to conversation, and the ordinary affairs of life, if the ideas they stand for, be not some way answering the common appearances and

agreement of substances, as they really exist.

§29. Though very imperfect. Secondly, though the mind of man, in making its complex ideas of substances, never puts any together that do not really, or are not supposed to co-exist; and so it truly borrows that union from nature: yet the number it combines, depends upon the various care, industry, or fancy of him that makes it. Men generally content themselves with some few sensible obvious qualities; and often, if not always, leave out others as material, and as firmly united, as those that they take. Of sensible substances there are two sorts: one of organized bodies, which are propagated by seed; and in these, the shape is that, which to us is the leading quality, and most characteristical part, that determines the species: and therefore in vegetables and animals, an extended solid substance of such a certain figure usually serves the turn. For however some men seem to prize their definition of animal rationale, yet should there a creature be found, that had language and reason, but partaked not of the usual shape of a man, I believe it would hardly pass for a man, how much soever it were animal rationale. And if Balaam's ass had, all his life, discoursed as rationally as he did once with his master, I doubt yet whether anyone would have thought him worthy the name man, or allowed him to be of the same species with himself. As in vegetables and animals 'tis the shape, so in most other bodies, not propagated by seed, 'tis the colour we most fix on, and are most led by. Thus where we find the colour of gold, we are apt to imagine all the other qualities, comprehended in our complex idea, to be there also: and we commonly take these two obvious qualities, viz. shape and colour for so presumptive ideas of several species, that in a good picture, we readily say, this is a lion, and that a rose; this is a gold, and that a silver goblet, only by the different figures and colours represented to the eye by the pencil.

§30. Which yet serve for common converse. But though this serves well enough for gross and confused conceptions, and inaccurate ways of talking and thinking; yet men are far enough from having agreed on the precise number of simple ideas, or qualities, belonging to any sort of things, signified by its name. Nor is it a wonder, since it requires much time, pains, and skill, strict inquiry, and long examination, to find out what, and how many those simple ideas are, which are constantly and inseparably united in nature, and are always to be found together in the same subject. Most men, wanting either

time, inclination, or industry enough for this, even to some tolerable degree, content themselves with some few obvious, and outward appearances of things, thereby readily to distinguish and sort them for the common affairs of life: and so, without further examination, give them names, or take up the names already in use. Which, though in common conversation they pass well enough for the signs of some few obvious qualities co-existing, are yet far enough from comprehending, in a settled signification, a precise number of simple ideas; much less all those, which are united in nature. He that shall consider, after so much stir, about genus and species, and such a deal of talk of specific differences, how few words we have yet settled definitions of, may, with reason, imagine, that those forms, which there hath been so much noise made about, are only chimeras; which give us no light into the specific natures of things. And he that shall consider, how far the names of substances, are from having significations wherein all who use them do agree, will have reason to conclude, that though the nominal essences of substances, are all supposed to be copied from nature; yet they are all, or most of them, very imperfect. Since the composition of those complex ideas, are, in several men, very different: and therefore, that these boundaries of species, are as men, and not as nature makes them, if at least there are in nature any such prefixed bounds. 'Tis true, that many particular substances are so made by nature, that they have agreement and likeness one with another, and so afford a foundation of being ranked into sorts. But the sorting of things by us, or the making of determinate species, being in order to naming and comprehending them under general terms, I cannot see how it can be properly said, that nature sets the boundaries of the species of things: or if it be so, our boundaries of species, are not exactly conformable to those in nature. For we, having need of general names for present use, stay not for a perfect discovery of all those qualities, which would best show us their most material differences and agreements; but we ourselves divide them, by certain obvious appearances, into species, that we may the easier, under general names, communicate our thoughts about them. For having no other knowledge of any substance, but of the simple ideas, that are united in it; and observing several particular things to agree with others, in several of those simple ideas, we make that collection our specific idea, and give it a general name; that in recording our own thoughts, and in our discourse with others, we may in one short word, design all the individuals that agree in that complex idea, without enumerating the simple ideas, that make it up; and so not waste our

time and breath in tedious descriptions: which we see they are fain to do, who would discourse of any new sort of things, they have not yet a name for.

§31. Essences of species under the same name very different. But however, these species of substances pass well enough in ordinary conversation, 'tis plain, that this complex idea, wherein they observe several individuals to agree, is by different men, made very differently; by some more, and others less accurately. In some, this complex idea contains a greater, and in others a smaller number of qualities; and so is apparently such as the mind makes it. The yellow shining colour, makes gold to children; others add weight, malleableness, and fusibility; and others yet other qualities, which they find joined with that yellow colour, as constantly as its weight and fusibility: for in all these, and the like qualities, one has as good a right to be put into the complex idea of that substance, wherein they are all joined, as another. And therefore different men leaving out, or putting in several simple ideas, which others do not, according to their various examination, skill, or observation of that subject, have different essences of gold; which must therefore be of their own, and not of nature's making.

§32. The more general our ideas are, the more incomplete and partial they are. If the number of simple ideas, that make the nominal essence of the lowest species, or first sorting of individuals, depends on the mind of man, variously collecting them, 'tis much more evident, that they do so, in the more comprehensive classes, which, by the masters of logic are called genera. These are complex ideas designedly imperfect: and 'tis visible at first sight, that several of those qualities, that are to be found in the things themselves, are purposely left out of generical ideas. For as the mind, to make general ideas, comprehending several particulars, leaves out those of time, and place, and such other, that make them incommunicable to more than one individual, so to make other yet more general ideas, that may comprehend different sorts, it leaves out those qualities that distinguish them, and puts into its new collection, only such ideas, as are common to several sorts. The same convenience that made men express several parcels of yellow matter coming from Guinea and Peru, under one name, sets them also upon making of one name, that may comprehend both gold, and silver, and some other bodies of different sorts. This is done by leaving out those qualities, which are

peculiar to each sort; and retaining a complex idea, made up of those, that are common to them all. To which the name metal being annexed, there is a genus constituted; the essence whereof being that abstract idea, containing only malleableness and fusibility, with certain degrees of weight and fixedness, wherein some bodies of several kinds agree, leaves out the colour, and other qualities peculiar to gold, and silver, and the other sorts comprehended under the name metal. Whereby 'tis plain, that men follow not exactly the patterns set them by nature, when they make their general ideas of substances; since there is no body to be found, which has barely malleableness and fusibility in it, without other qualities as inseparable as those. But men, in making their general ideas, seeking more the convenience of language and quick dispatch, by short and comprehensive signs, than the true and precise nature of things, as they exist, have, in the framing their abstract ideas, chiefly pursued that end, which was, to be furnished with store of general, and variously comprehensive names. So that in this whole business of genera and species, the genus, or more comprehensive, is but a partial conception of what is in the species, and the species, but a partial idea of what is to be found in each individual. If therefore any, one will think, that a man, and a horse, and an animal, and a plant, etc. are distinguished by real essences made by nature, he must think nature to be very liberal of these real essences, making one for body, another for an animal, and another for a horse; and all these essences liberally bestowed upon Bucephalus. But if we would rightly consider what is done, in all these genera and species, or sorts, we should find, that there is no new thing made, but only more or less comprehensive signs whereby we may be enabled to express, in a few syllables, great numbers of particular things, as they agree in more or less general conceptions, which we have framed to that purpose. In all which, we may observe, that the more general term, is always the name of a less complex idea; and that each genus is but a partial conception of the species comprehended under it. So that if these abstract general ideas be thought to be complete, it can only be in respect of a certain established relation, between them and certain names, which are made use of to signify them; and not in respect of anything existing, as made by nature.

§33. This all accommodated to the end of speech. This is adjusted to the true end of speech, which is to be the easiest and shortest way of communicating our notions. For thus he, that would make and

discourse of things, as they agreed in the complex idea of extension and solidity, needed but use the word body, to denote all such. He that, to these, would join others, signified by the words life, sense, and spontaneous motion, needed but use the word animal, to signify all which partaked of those ideas: and he that had made a complex idea of a body, with life, sense, and motion, with the faculty of reasoning, and a certain shape joined to it, needed but use the short monosyllable man, to express all particulars that correspond to that complex idea. This is the proper business of genus and species: and this men do, without any consideration of real essences, or substantial forms; which come not within the reach of our knowledge, when we think of those things; nor within the signification of our words, when we discourse with others.

§34. Instance in cassowaries. Were I to talk with any, one, of a sort of birds, I lately saw in St James's Park, about three or four foot high, with a covering of something between feathers and hair, of a dark brown colour, without wings, but in the place thereof, two or three little branches, coming down like sprigs of Spanish broom; long great legs, with feet only of three claws, and without a tail; I must make this description of it, and so may make others understand me. but when I am told, that the name of 'tis cassuaris, I may then use that word to stand in discourse for all my complex idea mentioned in that description; though by that word, which is now become a specific name, I know no more of the real essence, or constitution of that sort of animals, than I did before; and knew probably as much of the nature of that species of birds, before I learned the name, as many Englishmen do of swans, or herons, which are specific names, very well known of sorts of birds common in England.

§35. Men determine the sorts. From what has been said, 'tis evident, that men make sorts of things. For it being different essences alone, that make different species, 'tis plain, that they who make those abstract ideas, which are the nominal essences, do thereby make the species, or sort. Should there be a body found, having all the other qualities of gold, except malleableness, 'twould, no doubt, be made a question whether it were gold or not; i.e. whether it were of that species. This could be determined only by that abstract idea, to which everyone annexed the name gold: so that it would be true gold to him, and belong to that species, who included not malleableness in his nominal essence, signified by the sound gold; and on the other side, it

would not be true gold, or of that species to him, who included malleableness in his specific idea. And who, I pray, is it, that makes these diverse species, even under one and the same name, but men that make two different abstract ideas, consisting not exactly of the same collection of qualities' Nor is it a mere supposition to imagine, that a body may exist, wherein the other obvious qualities of gold may be without malleableness; since 'tis certain, that gold itself will be sometimes so eager, (as artists call it) that it will as little endure the hammer, as glass itself. What we have said, of the putting in, or leaving out of malleableness out of the complex idea, the name gold is, by anyone, annexed to, may be said of its peculiar weight, fixedness, and several other the like qualities: for whatever is left out, or put in, 'tis still the complex idea, to which that name is annexed, that makes the species: and as any particular parcel of matter answers that idea, so the name of the sort belongs truly to it; and 'tis of that species. And thus anything is true gold, perfect metal. All which determination of the species, 'tis plain, depends on the understanding of man, making this or that complex idea.

§36. Nature makes the similitudes. This then, in short, is the case: nature makes many particular things, which do agree one with another, in many sensible qualities, and probably too, in their internal frame and constitution: but 'tis not this real essence that distinguishes them into species; 'tis men, who, taking occasion from the qualities they find united in them, and wherein, they observe often several individuals to agree, range them into sorts, in order to their naming, for the convenience of comprehensive signs; under which individuals, according to their conformity to this or that abstract idea, come to be ranked as under ensigns: so that this is of the blue, that the red regiment; this is a man, that a drill: and in this, I think, consists the whole business of genus and species.

§37. The manner of sorting particular beings the work of fallible men, though nature makes things alike. I do not deny, but nature, in the constant production of particular beings, makes them not always new and various, but very much alike and of kin one to another: but I think it nevertheless true, that the boundaries of the species, whereby men sort them, are made by men; since the essences of the species, distinguished by different names, are, as has been proved, of man's making, and seldom adequate to the internal nature of the things they are taken from. So that we may truly say, such a manner

of sorting of things, is the workmanship of men.

§38. Each abstract idea is an essence. One thing, I doubt not, but will seem very strange in this doctrine; which is, that from what has been said, it will follow, that each abstract idea, with a name to it, makes a distinct species. But who can help it, if truth will have it so? For so it must remain, till somebody can show us the species of things, limited and distinguished by something else; and let us see, that general terms signify not our abstract ideas, but something different from them. I would fain know, why a shock and a hound, are not as distinct species, as a spaniel and an elephant. We have no other idea of the different essence of an elephant and a spaniel, than we have of the different essence of a shock and a hound; all the essential difference, whereby we know and distinguish them one from another, consisting only in the different collection of simple ideas, to which we have given those different names.

§39. Genera and species are in order to naming. How much the making of species and genera is in order to general names, and how much general names are necessary, if not to the being, yet at least to the completing of a species, and making it pass for such, will appear, besides what has been said above concerning ice and water, in a very familiar example. A silent and a striking watch, are but one species, to those who have but one name for them: but he that has the name watch for one, and clock for the other, and distinct complex ideas, to which those names belong, to him they are different species. It will be said, perhaps, that the inward contrivance and constitution is different between these two, which the watch-maker has a clear idea of. And yet, 'tis plain, they are but one species to him, when he has but one name for them. For what is sufficient in the inward contrivance, to make a new species? There are some watches, that are made with four wheels, others with five; is this a specific difference to the workman? Some have strings and physies, and others none; some have the balance loose, and others regulated by a spiral spring, and others by hogs' bristles: are any, or all of these enough to make a specific difference to the workman, that knows each of these, and several other different contrivances, in the internal constitutions of watches? 'Tis certain, each of these hath a real difference from the rest: but whether it be an essential, a specific difference or no, relates only to the complex idea, to which the name watch is given: as long as they all agree in the idea which that name stands for, and that name does

not as a generical name comprehend different species under it, they are not essentially nor specifically different. But if any one will make minuter divisions from differences, that he knows in the internal frame of watches; and to such precise complex ideas, give names that shall prevail, they will then be new species to them, who have those ideas with names to them; and can, by those differences distinguish watches into these several sorts; and then watch will be a generical name. But yet they would be no distinct species to men, ignorant of clockwork, and the inward contrivances of watches, who had no other idea but the outward shape and bulk, with the marking of the hours by the hand. For to them, all those other names would be but synonymous terms for the same idea, and signify no more, nor no other thing but a watch. Just thus I think 'tis in natural things. Nobody will doubt that the wheels, or springs (if I may so say) within, are different in a rational man, and a changeling, no more than that there is a difference in the frame between a drill and a changeling. But whether one or both these differences be essential or specifical, is only to be known to us, by their agreement, or disagreement with the complex idea that the name man stands for: for by that alone can it be determined, whether one, or both, or neither of those be a man, or no.

§40. Species of artificial things less confused than natural. From what has been before said, we may see the reason why, in the species of artificial things, there is generally less confusion and uncertainty than in natural. Because an artificial thing being a production of man, which the artificer designed, and therefore well knows the idea of, the name of 'tis supposed to stand for no other idea, nor to import any other essence, than what is certainly to be known, and easy enough to be apprehended. For the idea or essence of the several sorts of artificial things, consisting for the most part in nothing but the determinate figure of sensible parts, and sometimes motion depending thereon, which the artificer fashions in matter, such as he finds for his turn, 'tis not beyond the reach of our faculties to attain a certain idea thereof; and so settle the signification of the names whereby the species of artificial things are distinguished, with less doubt, obscurity, and equivocation, than we can in things natural, whose differences and operations depend upon contrivances, beyond the reach of our discoveries.

§41. Artificial things of distinct species. I must be excused here if I think artificial things are of distinct species, as well as natural: since

I find they are as plainly and orderly ranked into sorts, by different abstract ideas, with general names annexed to them, as distinct one from another as those of natural substances. For why should we not think a watch, and pistol as distinct species one from another, as a horse and a dog, they being expressed in our minds by distinct ideas, and to others, by distinct appellations‘

§42. Substances alone have proper names, This is further to be observed concerning substances, that they alone of all our several sorts of ideas have particular, or proper names, whereby one only particular thing is signified. Because in simple ideas, modes, and relations, it seldom happens that men have occasion to mention often this, or that particular, when 'tis absent. Besides, the greatest part of mixed modes, being actions, which perish in their birth, are not capable of a lasting duration, as substances, which are the actors; and wherein the simple ideas that make up the complex ideas designed by the name, have a lasting union.

§43. Difficulty to treat of words. I must beg pardon of my reader, for having dwelt so long upon this subject, and perhaps, with some obscurity. But I desire, it may be considered, how difficult it is, to lead another by words into the thoughts of things, stripped of those specifical differences we give them: which things, if I name not, I say nothing; and if I do name them, I thereby rank them into some sort, or other, and suggest to the mind the usual abstract idea of that species; and so cross my purpose. For, to talk of a man, and to lay by, at the same time, the ordinary signification of the name man, which is our complex idea, usually annexed to it; and bid the reader consider man, as he is in himself, and as he is really distinguished from others, in his internal constitution, or real essence, that is, by something, he knows not what, looks like trifling: and yet thus one must do, who would speak of the supposed real essences and species of things, as thought to be made by nature, if it be but only to make it understood, that there is no such thing signified by the general names which substances are called by. But because 'tis difficult by known familiar names to do this, give me leave to endeavour by an example, to make the different consideration the mind has of specific names and ideas, a little more clear; and to show how the complex ideas of modes, are referred sometimes to archetypes in the minds of other intelligent beings; or which is the same, to the signification annexed by others to their received names; and sometimes to no archetypes at all. Give me

leave also to show how the mind always refers its ideas of substances, either to the substances themselves, or to the signification of their names, as to the archetypes; and also to make plain the nature of species, or sorting of things, as apprehended and made use of by us; and of the essences belonging to those species, which is, perhaps, of more moment, to discover the extent and certainty of our knowledge, than we at first imagine.

44. Instance of mixed modes in kinneah and niouph. Let us suppose Adam in the state of a grown man, with a good understanding, but in a strange country, with all things new, and unknown about him; and no other faculties, to attain the knowledge of them, but what one of this age has now. He observes Lamech more melancholy than usual, and imagines it to be from a suspicion he has of his wife Adah (whom he most ardently loved) that she had too much kindness for another man. Adam discourses these his thoughts to Eve, and desires her to take care that Adah commit not folly: and in these discourses with Eve, he makes use of these two new words, kinneah and niouph. In time, Adam's mistake appears, for he finds Lamech's trouble proceeded from having killed a man: but yet the two names kinneah and niouph; the one standing for suspicion, in a husband, of his wife's disloyalty to him, and the other, for the act of committing disloyalty, lost not their distinct significations. 'Tis plain then, that here were two distinct complex ideas of mixed modes, with names to them, two distinct species of actions essentially different; I ask wherein consisted the essences of these two distinct species of actions? And 'tis plain it, consisted in a precise combination of simple ideas, different in one from the other. I ask, whether the complex idea in Adam's mind, which he called kinneah, were adequate or not? And 'tis plain it was; for it being a combination of simple ideas, which he, without any regard to any archetype, without respect to anything as a pattern, voluntarily put together, abstracted, and gave the name kinneah to, to express in short to others, by that one sound, all the simple ideas contained and united in that complex one; it must necessarily follow that it was an adequate idea. His own choice having made that combination, it had all in it he intended it should, and so could not but be perfect, could not but be adequate; it being referred to no other archetype, which it was supposed to represent.

§45. These words, kinneah and niouph, by degrees grew into common use; and then the case was somewhat altered. Adam's

children had the same faculties, and thereby the same power that he had, to make what complex ideas of mixed modes they pleased in their own minds; to abstract them, and make what sounds, they pleased the signs of them: but the use of names being to make our ideas within us known to others, that cannot be done, but when the same sign stands for the same idea in two, who would communicate their thoughts, and discourse together. Those therefore of Adam's children, that found these two words, kinneah and niouph, in familiar use, could not take them for insignificant sounds: but must needs conclude they stood for something, for certain ideas, abstract ideas, they being general names, which abstract ideas were the essences of the species distinguished by those names. If therefore they would use these words, as names of species already established and agreed on, they were obliged to conform the ideas, in their minds, signified by these names, to the ideas that they stood for in other men's minds, as to their patterns and archetypes; and then indeed their ideas of these complex modes were liable to be inadequate, as being very apt (especially those that consisted of combinations of many simple ideas) not to be exactly conformable to the ideas in other men's minds, using the same names; though for this, there be usually a remedy at hand, which is, to ask the meaning of any word, we understand not, of him that uses it: it being as impossible, to know certainly, what the words jealousy and adultery, stand for in another man's mind, with whom I would discourse about them; as it was impossible, in the beginning of language, to know what kinneah and niouph stood for in another man's mind, without explication, they being voluntary signs in every one.

§46. Instance of substances in zahab. Let us now also consider after the same manner, the names of substances, in their first application. One of Adam's children, roving in the mountains, lights on a glittering substance, which pleases his eye. Home he carries it to Adam, who, upon consideration of it, finds it to be hard, to have a bright yellow colour, and an exceeding great weight. These, perhaps at first, are all the qualities, he takes notice of in it, and abstracting this complex idea, consisting of a substance having that peculiar bright yellowness, and a weight very great in proportion to its bulk, he gives the name zahab, to denominate and mark all substances, that have these sensible qualities in them. 'Tis evident now, that, in this case, Adam acts quite differently, from what he did before in forming those ideas of mixed modes, to which he gave the names kinneah and

niouph. For there he put ideas together only by his own imagination, not taken from the existence of anything; and to them he gave names to denominate all things, that should happen to agree to those his abstract ideas, without considering whether any such thing did exist, or no; the standard there was of his own making. But in the forming his idea of this new substance, he takes the quite contrary course; here he has standard made by nature; and therefore being to represent that to himself, by the idea he has of it, even when 'tis absent, he puts in no simple idea into his complex one, but what he has the perception of from the thing itself. He takes care that his idea be conformable to this archetype, and intends the name should stand for an idea so conformable.

§47. This piece of matter, thus denominated zahab by Adam, being quite different from any he had seen before, nobody, I think, will deny to be a distinct species, and to have its peculiar essence; and that the name zahab is the mark of the species, and a name belonging to all things partaking in that essence. But here 'tis plain the essence, Adam made the name zahab stand for was nothing but a body hard, shining, yellow, and very heavy. But the inquisitive mind of man, not content with the knowledge of these, as I may say, superficial qualities, puts Adam upon further examination of this matter. He therefore knocks, and beats it with flints, to see what was discoverable in the inside: he finds it yield to blows, but not easily separate into pieces: he finds it will bend without breaking. Is not now ductility to be added to his former idea, and made part of the essence of the species, that name Zahab stands for? Further trials discover fusibility, and fixedness. Are not they also, by the same reason, that any of the others were, to be put into the complex idea, signified by the name zahab? If not, what reason will there be shown more for the one than the other? If these must, then all the other properties, which any further trials shall discover in this matter, ought by the same reason to make a part of the ingredients of the complex idea, which the name zahab stands for, and so be the essence of the species, marked by that name. Which properties, because they are endless, 'tis plain that the idea made after this fashion by this archetype, will be always inadequate.

§48. Their ideas imperfect, and therefore various. But this is not all. It would also follow, that the names of substances would not only have, as in truth they have, but would also be supposed to have

different significations, as used by different men, which would very much cumber the use of language. For if every distinct quality, that were discovered in any matter by any one, were supposed to make a necessary part of the complex idea, signified by the common name given it, it must follow, that men must suppose the same word to signify different things in different men: since they cannot doubt, but different men may have discovered several qualities in substances of the same denomination, which others know nothing of.

§49. Therefore to fix their species, a real essence is supposed. To avoid this therefore, they have supposed a real essence belonging to every species, from which these properties all flow, and would have their name of the species stand for that. But they not having any idea of that real essence in substances, and their words signifying nothing but the ideas they have, that which is done by this attempt, is only to put the name or sound, in the place and stead of the thing having that real essence, without knowing what the real essence is; and this is that which men do, when they speak of species of things, as supposing them made by nature, and distinguished by real essences.

§50. Which supposition is of no use. For, let us consider, when we affirm that all gold is fixed, either it means that fixedness is a part of the definition, part of the nominal essence the word gold stands for; and so this affirmation, 'all gold is fixed,' contains nothing but the signification of the term gold. Or else it means, that fixedness not being a part of the definition of the word gold, is a property of that substance itself: in which case, 'tis plain that the word gold stands in the place of a substance, having the real essence of a species of thing made by nature. In which way of substitution, it has so confused and uncertain a signification, that though this proposition, 'gold is fixed', be in that sense an affirmation of something real; yet 'tis a truth will always fail us in its particular application, and so is of no real use or certainty. For let it be ever so true, that all gold, i.e. all that has the real essence of gold, is fixed, what serves this for, whilst we know not in this sense, what is or is not gold? For if we know not the real essence, of gold, 'tis impossible we should know what parcel of matter has that essence, and so whether it be true gold or no.

§51. Conclusion. To conclude; what liberty Adam had at first to make any complex ideas of mixed modes, by no other pattern, but by his own thoughts, the same have all men ever since had. And the same

necessity of conforming his ideas of substances to things without him, as to archetypes made by nature, that Adam was under, if he would not wilfully impose upon himself, the same are all men ever since under too. The same liberty also, that Adam had of affixing any new name to any idea, the same has anyone still, (especially the beginners of languages, if we can imagine any such); but only with this difference, that in places, where men in society have already established a language amongst them, the signification of words are very warily and sparingly to be altered. Because men being furnished already with names for their ideas, and common use having appropriated known names to certain ideas, an affected misapplication of them cannot but be very ridiculous. He that hath new notions, will, perhaps, venture sometimes on the coining of new terms to express them: but men think it a boldness, and 'tis uncertain, whether common use will ever make them pass for current. But in communication with others, 'tis necessary that we conform the ideas we make the vulgar words of any language stand for, to their known proper significations, (which I have explained at large already), or else to make known that new signification, we apply them to.

Chapter VII Of Particles

§1. Particles connect parts, or whole sentences together. Besides words, which are names of ideas in the mind, there are a great many others that are made use of, to signify the connexion that the mind gives to ideas, or propositions, one with another. The mind, in communicating its thought to others, does not only need signs of the ideas it has then before it, but others also, to show or intimate some particular action of its own, at that time, relating to those ideas. This it does several ways; as is, and is not, are the general marks of the mind, affirming or denying. But besides affirmation, or negation, without which, there is in words no truth or falsehood, the mind does, in declaring its sentiments to others, connect, not only the parts of propositions, but whole sentences one to another, with their several relations and dependencies, to make a coherent discourse.

§2. In them consists the art of well speaking. The words, whereby it signifies what connexion it gives to the several affirmations and negations, that it unites in one continued reasoning or narration, are generally called particles: and 'tis in the right use of these, that more particularly consists the clearness and beauty of a good style. To think

well, 'tis not enough, that a man has ideas clear and distinct in his thoughts, nor that he observes the agreement, or disagreement of some of them; but he must think in train, and observe the dependence of his thoughts and reasonings, one upon another: and to express well such methodical and rational thoughts, he must have words to show what connexion, restriction, distinction, opposition, emphasis, etc. he gives to each respective part of his discourse. To mistake in any of these, is to puzzle, instead of informing, his hearer: and therefore it is, that those words, which are not truly, by themselves, the names of any ideas, are of such constant and indispensable use in language, and do much contribute to men's well expressing themselves.

§3. They show what relation the mind gives to its own thoughts. This part of grammar has been, perhaps, as much neglected, as some others over-diligently cultivated. 'Tis easy for men to write, one after another, of cases and genders, moods and tenses, gerunds and supines: in these and the like, there has been great diligence used; and particles themselves, in some languages, have been, with great show of exactness, ranked into their several orders. But though prepositions and conjunctions, etc. are names well known in grammar, and the particles contained under them carefully ranked into their distinct subdivisions; yet he who would show the right use of particles, and what significancy and force they have, must take a little more pains, enter into his own thoughts, and observe nicely the several postures of his mind in discoursing.

§4. Neither is it enough, for the explaining of these words, to render them, as is usual in dictionaries, by words of another tongue which come nearest to their signification: for what is meant by them, is commonly as hard to be understood in one as another language. They are all marks of some action, or intimation of the mind; and therefore to understand them rightly, the several views, postures, stands, turns, limitations, and exceptions, and several other thoughts of the mind, for which we have either none, or very deficient names, are diligently to be studied. Of these, there is a great variety, much exceeding the number of particles, that most languages have to express them by: and therefore 'tis not to be wondered, that most of these particles have divers, and sometimes almost opposite significations. In the Hebrew tongue, there is a particle consisting but of one single letter, of which there are reckoned up, as I remember, seventy, I am sure above fifty several significations.

§5. Instance in BUT. BUT is a particle, none more familiar in our language: and he that says 'tis a discretive conjunction, and that it answers *sed* in Latin, or *mais* in French, thinks he has sufficiently explained it. But yet it seems to me to intimate several relations, the mind gives to the several propositions or parts of them, which it joins by this monosyllable.

First, 'BUT to say no more': here it intimates a stop of the mind, in the course it was going, before it came quite to the end of it.

Secondly, 'I saw but two plants'. here it shows, that the mind limits the sense to what is expressed, with a negation of all other.

Thirdly, 'You pray; but 'tis not that God would bring you to the true religion.'

Fourthly, 'BUT that he would confirm you in your own'. The first of these BUTs intimates a supposition in the mind of something otherwise than it should be; the latter shows, that the mind makes a direct opposition between that, and what goes before it.

Fifthly, 'All animals have sense, BUT a dog is an animal': here it signifies little more, but that the latter proposition is joined to the former, as the minor of a syllogism.

§6. To these, I doubt not, might be added a great many other significations of this particle, if it were my business to examine it in its full latitude, and consider it in all the places 'tis to be found: which if one should do, I doubt, whether in all those manners 'tis made use of, it would deserve the title of discretive, which grammarians give to it. But I intend not here a full explication of this sort of signs. The instances I have given in this one, may give occasion to reflect on their use and force in language, and lead us into the contemplation of several actions of our minds in discoursing, which it has found a way to intimate to others by these particles, some whereof constantly, and others in certain constructions, have the sense of a whole sentence contained in them.

Chapter VIII Of Abstract and Concrete Terms

§1. Abstract terms not predictable one of another, and why. The ordinary words of language, and our common use of them, would

have given us light into the nature of our ideas, if they had been but considered with attention. The mind, as has been shown, has a power to abstract its ideas, and so they become essences, general essences, whereby the sorts of things are distinguished. Now each abstract idea being distinct, so that of any two the one can never be the other, the mind will, by its intuitive knowledge, perceive their difference; and therefore in propositions no two whole ideas can ever be affirmed one of another. This we see in the common use of language, which permits not any two abstract words, or names of abstract ideas, to be affirmed one of another. For how near of kin soever they may seem to be, and how certain soever 'tis, that man is an animal, or rational, or white, yet every, one at first hearing, perceives the falsehood of these propositions: humanity is animality, or rationality, or whiteness; and this is as evident, as any of the most allowed maxims. All our affirmations then are only in concrete, which is the affirming, not one abstract idea to be another, but one abstract idea to be joined to another; which abstract ideas, in substances, may be of any sort; in all the rest, are little else but of relations; and in substances the most frequent are of powers: v.g. 'a man is white,' signifies, that the thing that has the essence of a man, has also in it the essence of whiteness, which is nothing but a power to produce the idea of whiteness in one, whose eyes can discover ordinary objects; or, 'a man is rational,' signifies, that the same thing, that hath the essence of a man, hath also in it the essence of rationality, i.e. a power of reasoning.

§2. They show the difference of our ideas. This distinction of names shows us also the difference of our ideas: for if we observe them, we shall find, that our simple ideas have all abstract, as well as concrete names: the one whereof is (to speak the language of grammarians) a substantive, the other an adjective; as whiteness, white; sweetness, sweet. The like also holds in our ideas of modes and relations; as justice, just; equality, equal; only with this difference, that some of the concrete names of relations, amongst men chiefly, are substantives; as, paternitas, pater; whereof it were easy to render a reason. But as to our ideas of substances, we have very few or no abstract names at all. For though the Schools have introduced animalitas, humanitas, corporietas, and some others; yet they hold no proportion with that infinite number of names of substances, to which they never were ridiculous enough to attempt the coining of abstract ones: and those few that the schools forged, and put into the mouths

of their scholars, could never yet get admittance into common use, or obtain the license of public approbation. Which seems to me at least to intimate the confession of all mankind, that they have no ideas of the real essences of substances, since they have not names for such ideas: which no doubt they would have had, had not their consciousness to themselves of their ignorance of them, kept them from so idle an attempt. And therefore though they had ideas enough to distinguish gold from a stone, and metal from wood; yet they but timorously ventured on such terms, as *aurietas* and *saxietas*, *metallietas* and *lignietas*, or the like names, which should pretend to signify the real essences of those substances, whereof they knew they had no ideas. And indeed it was only the doctrine of substantial forms, and the confidence of mistaken pretenders to a knowledge that they had not, which first coined, and then introduced *animalitas*, and *humanitas*, and the like; which yet went very little further than their own Schools, and could never get to be current amongst understanding men. Indeed, *humanitas* was a word familiar amongst the Romans; but in a far different sense, and stood not for the abstract essence of any substance; but was the abstract name of a mode, and its concrete *humanus*, not *homo*.

Chapter IX Of the Imperfection of Words

§1. Words are used for recording and communicating our thoughts. From what has been said in the foregoing chapters, 'tis easy to perceive, what imperfection there is in language, and how the very nature of words, makes it almost unavoidable, for many of them to be doubtful and uncertain in their significations. To examine the perfection or imperfection of words, 'tis necessary first to consider their use and end: for as they are more or less fitted to attain that, so they are more or less perfect. We have, in the former part of this discourse, often, upon occasion, mentioned a double use of words.

First, one for the recording of our own thoughts.

Secondly, the other for the communicating of our thoughts to others.

§2. Any words will serve for recording. As to the first of these, for the recording our own thoughts for the help of our own memories, whereby, as it were, we talk to ourselves, any words will

serve the turn. For since sounds are voluntary and indifferent signs of any ideas, a man may use what words he pleases, to signify his own ideas to himself: and there will be no imperfection in them, if he constantly use the same sign for the same idea: for then he cannot fail of having his meaning understood, wherein consists the right use and perfection of language.

§3. Communication by words civil or philosophical. Secondly, as to communication by words, that too has a double use.

I. Civil.

II. Philosophical.

First, by their civil use, I mean such a communication of thoughts and ideas by words, as may serve for the upholding common conversation and commerce, about the ordinary affairs and conveniences of civil life, in the societies of men, one amongst another.

Secondly, By the philosophical use of words, I mean such a use of them as may serve to convey the precise notions of things, and to express, in general propositions, certain and undoubted truths, which the mind may rest upon and be satisfied with, in its search after true knowledge. These two uses are very distinct; and a great deal less exactness will serve in the one, than in the other, as we shall see in what follows.

§4. The imperfection of words is the doubtfulness of their signification. The chief end of language in communication being to be understood, words serve not well for that end, neither in civil, nor philosophical discourse, when any word does not excite in the hearer, the same idea which it stands for in the mind of the speaker. Now, since sounds have no natural connexion with our ideas, but have all their signification from the arbitrary imposition of men, the doubtfulness and uncertainty of their signification, which is the imperfection we here are speaking of, has its cause more in the ideas they stand for, than in any incapacity there is in one sound, more than in another, to signify any idea: for in that regard they are all equally perfect.

That then which makes doubtfulness and uncertainty in the

signification of some more than other words, is the difference of ideas they stand for.

§5. Causes of their imperfection. Words having naturally no signification, the idea which each stands for, must be learned and retained by those, who would exchange thoughts, and hold intelligible discourse with others, in any language. But this is hardest to be done, where,

First, the ideas they stand for, are very complex, and made up of a great number of ideas put together.

Secondly, where the ideas they stand for, have no certain connexion in nature; and so no settled standard, anywhere in nature existing, to rectify and adjust them by.

Thirdly, when the signification of the word is referred to a standard, which standard is not easy to be known.

Fourthly, where the signification of the word, and the real essence of the thing are not exactly the same.

These are difficulties that attend the signification of several words that are intelligible. Those which are not intelligible at all, such as names standing for any simple ideas, which another has not organs or faculties to attain; as the names of colours to a blind man, or sounds to a deaf man, need not here be mentioned.

In all these cases, we shall find an imperfection in words; which I shall more at large explain, in their particular application to our several sorts of ideas: for if we examine them, we shall find that the names of mixed modes are most liable to doubtfulness and imperfection, for the two first of these reasons; and the names of Substances chiefly for the two latter.

§6. The names of mixed modes doubtful. First, because the ideas they stand for, are so complex. First, The names of mixed modes, are many of them liable to great uncertainty and obscurity in their signification.

I. Because of that great composition, these complex ideas are often made up of. To make words serviceable to the end of communication, 'tis necessary, (as has been said) that they excite, in

the hearer, exactly the same idea, they stand for in the mind of the speaker. Without this, men fill one another's heads with noise and sounds; but convey not thereby their thoughts, and lay not before one another their ideas, which is the end of discourse and language. But when a word stands for a very complex idea, that is compounded and decomposed, 'tis not easy for men to form and retain that idea so exactly, as to make the name in common use stand for the same precise idea, without any the least variation. Hence it comes to pass, that men's names, of very compound ideas, such as for the most part are moral words, have seldom, in two different men, the same precise signification; since one man's complex idea seldom agrees with another's, and often differs from his own, from that which he had yesterday, or will have tomorrow.

§7. Secondly, because they have no standards. II. Because the names of mixed modes, for the most part, want standards in nature, whereby men may rectify and adjust their significations, therefore they are very various and doubtful. They are assemblages of ideas put together at the pleasure of the mind, pursuing its own ends of discourse, and suited to its own notions; whereby it designs not to copy anything really existing, but to denominate and rank things as they come to agree, with those archetypes or forms it has made. He that first brought the word sham, wheedle, or banter in use, put together, as he thought fit, those ideas he made it stand for; and as 'tis with any new names of modes, that are now brought into any language; so it was with the old ones, when they were first made use of. Names therefore, that stand for collections of ideas, which the mind makes at pleasure, must needs be of doubtful signification, when such collections are nowhere to be found constantly united in nature, nor any patterns to be shown whereby men may adjust them. What the word murder, or sacrilege, etc. signifies, can never be known from things themselves: there be many of the parts of those complex ideas, which are not visible in the action itself; the intention of the mind, or the relation of holy things, which make a part of murder, or sacrilege, have no necessary connexion with the outward and visible action of him that commits either: and the pulling the trigger of the gun, with which the murder is committed, and is all the action, that, perhaps, is visible, has no natural connexion with those other ideas, that make up the complex one, named murder. They have their union and combination only from the understanding which unites them under one name: but uniting them without any rule or pattern, it

cannot be but that the signification of the name that stands for such voluntary collections, should be often various in the minds of different men, who have scarce any standing rule to regulate themselves, and their notions by, in such arbitrary ideas.

§8. Propriety not a sufficient remedy. 'Tis true, common use, that is, the rule of propriety, may be supposed here to afford some aid, to settle the signification of language; and it cannot be denied, but that in some measure it does. Common use regulates the meaning of words pretty well for common conversation; but nobody having an authority to establish the precise signification of words, nor determine to what ideas any, one shall annex them, common use is not sufficient to adjust them to Philosophical Discourses; there being scarce any name, of any very complex idea (to say nothing of others) which, in common use, has not a great latitude, and which keeping within the bounds of propriety, may not be made the sign of far different ideas. Besides the rule and measure of propriety itself being nowhere established, 'tis often matter of dispute, whether this or that way of using a word, be propriety of speech, or no. From all which, 'tis evident, that the names of such kind of very complex ideas, are naturally liable to this imperfection, to be of doubtful and uncertain signification; and even in men, that have a mind to understand one another, do not always stand for the same idea in speaker and hearer. Though the names glory and gratitude be the same in every man's mouth, through a whole country, yet the complex collective idea which everyone thinks on, or intends by that name, is apparently very different in men using the same language.

§9. The way of learning these names contributes also to their doubtfulness. The way also wherein the names of mixed modes are ordinarily learned, does not a little contribute to the doubtfulness of their signification. For if we will observe how children learn languages, we shall find, that to make them understand what the names of simple ideas, or substances, stand for, people ordinarily show them the thing, whereof they would have them have the idea; and then repeat to them the name that stands for it, as white, sweet, milk, sugar, cat, dog. But as for mixed modes, especially the most material of them, moral words, the sounds are usually learned first and then to know what complex ideas they stand for, they are either beholden to the explication of others, or (which happens for the most part) are left to their own observation and industry; which being little

laid out in the search of the true and precise meaning of names, these moral words are, in most men's mouths, little more than bare sounds; or when they have any, 'tis for the most part but a very loose and undetermined, and consequently obscure and confused signification. And even those themselves, who have with more attention settled their notions, do yet hardly avoid the inconvenience, to have them stand for complex ideas, different from those which other, even intelligent and studious men, make them the signs of. Where shall one find any, either controversial debate, or familiar discourse, concerning honour, faith, grace, religion, church, etc. wherein 'tis not easy to observe the different notions men have of them; Which is nothing but this, that they are not agreed in the signification of those words: nor have in their minds the same complex ideas which they make them stand for: and so all the contests that follow thereupon, are only about the meaning of a sound. And hence we see, that in the interpretation of laws, whether divine, or human, there is no end; comments beget comments, and explications make new matter for explications; and of limiting, distinguishing, varying the signification of these moral words, there is no end. These ideas of men's making are, by men still having the same power, multiplied in infinitum. Many a man, who was pretty well satisfied of the meaning of a text of Scripture, or clause in the code, at first reading, has, by consulting commentators, quite lost the sense of it, and, by these elucidations, given rise or increase to his doubts, and drawn obscurity upon the place. I say not this, that I think commentaries needless; but to show how uncertain the names of mixed modes naturally are, even in the mouths of those, who had both the intention and the faculty of speaking as clearly, as language was capable to express their thoughts.

§10. Hence unavoidable obscurity in ancient authors. What obscurity this has unavoidably brought upon the writings of men, who have lived in remote ages, and different countries, it will be needless to take notice. Since the numerous volumes of learned men, employing their thoughts that way, are proofs more than enough, to show what attention, study, sagacity, and reasoning are required, to find out the true meaning of ancient authors. But there being no writings we have any great concernment to be very solicitous about the meaning of, but those that contain either truths we are required to believe, or laws we are to obey, and draw inconveniences on us, when we mistake or transgress, we may be less anxious about the sense of other authors;

who, writing but their own opinions, we are under no greater necessity to know them, than they to know ours. Our good or evil depending not on their decrees, we may safely be ignorant of their notions: and therefore in the reading of them, if they do not use their words with a due clearness and perspicuity, we may lay them aside, and without any injury done them, resolve thus with ourselves,

Si non vis intelligi, debes negligi.

§11. Names of substances of doubtful signification, because the ideas they stand for relate to the reality of things. If the signification of the names of mixed modes be uncertain, because there be no real standards existing in nature, to which those ideas are referred, and by which they may be adjusted, the names of substances are of a doubtful signification, for a contrary reason, viz. because the ideas, they stand for, are supposed conformable to the reality of things, and are referred to standards made by Nature. In our ideas of substances we have not the liberty as in mixed modes, to frame what combinations we think fit, to be the characteristical notes, to rank and denominate things by. In these we must follow nature, suit our complex ideas to real existences, and regulate the signification of their names by the things themselves, if we will have our names to be signs of them, and stand for them. Here, 'tis true, we have patterns to follow; but patterns, that will make the signification of their names very uncertain: for names must be of a very unsteady and various meaning, if the ideas they stand for be referred to standards without us, that either cannot be known at all, or can be known but imperfectly and uncertainly.

§12. Names of substances referred, first, to real essences that cannot be known. The names of substances have, as has been shown, a double reference in their ordinary use.

First, Sometimes they are made to stand for, and so their signification is supposed to agree to, the real constitution of things, from which all their properties flow, and in which they all centre. But this real constitution, or (as 'tis apt to be called) essence, being utterly unknown to us, any sound that is put to stand for it, must be very uncertain in its application; and it will be impossible to know, what things are or ought to be called an horse, or antimony, when those words are put for real essences that we have no ideas of at all. And therefore in this supposition, the names of substances being referred to standards that cannot be known, their significations can never be

adjusted and established by those standards.

§13. Secondly, to co-existing qualities, which are known but imperfectly. Secondly, the simple ideas that are found to co-exist in substances, being that which their names immediately signify, these, as united in the several sorts of things, are the proper standards to which their names are referred, and by which their significations may be best rectified. But neither will these archetypes so well serve to this purpose, as to leave these names, without very various and uncertain significations. Because these simple ideas that coexist, and are united in the same subject, being very numerous, and having all an equal right to go into the complex specific idea, which the specific name is to stand for, men, though they propose to themselves the very same subject to consider, yet frame very different ideas about it; and so the name they use for it, unavoidably comes to have, in several men, very different significations. The simple qualities which make up the complex ideas, being most of them powers, in relation to changes, which they are apt to make in, or receive from other bodies, are almost infinite. He that shall but observe, what a great variety of alterations any one of the baser metals is apt to receive, from the different application only of fire; and how much a greater number of changes any of them will receive in the hands of a chymist, by the application of other bodies, will not think it strange, that I count the properties of any sort of bodies not easy to be collected, and completely known by the ways of inquiry, which our faculties are capable of. They being therefore at least so many, that no man can know the precise and definite number, they are differently discovered by different men, according to their various skill, attention, and ways of handling; who therefore cannot choose but have different ideas of the same substance, and therefore make the signification of its common name very various and uncertain. For the complex ideas of substances, being made up of such simple ones as are supposed to co-exist in nature, every one has a right to put into his complex idea, those qualities he has found to be united together. For though in the substance gold, one satisfies himself with colour and weight, yet another thinks solubility in aqua regia, as necessary to be joined with that colour in his idea of gold, as any one does its fusibility; solubility in aqua regia, being a quality as constantly joined with its colour and weight, as fusibility, or any other; others put in its ductility or fixedness, etc. as they have been taught by tradition or experience. Who of all these, has established the right signification of the word

gold' Or who shall be the judge to determine' Each has his standard in nature, which he appeals to, and with reason thinks he has the same right to put into his complex idea, signified by the word gold, those qualities, which, upon trial he has found united; as another, who has not so well examined, has to leave them out; or a third, who has made other trials, has to put in others. For the union in nature of these qualities, being the true ground of their union in one complex idea, who can say one of them has more reason to be put in or left out than another' From hence it will always unavoidably follow, that the complex ideas of substances in men using the same names for them, will be very various, and so the significations of those names very uncertain.

§14. Thirdly, to coexisting qualities which are known but imperfectly. Besides, there is scarce any particular thing existing, which, in some of its simple ideas, does not communicate with a greater, and in others with a less number of particular beings: who shall determine in this case, which are those that are to make up the precise collection that is to be signified by the specific name; or can with any just authority prescribe, which obvious or common qualities are to be left out; or which more secret, or more particular, are to be put into the signification of the name of any substance' All which together, seldom or never fall to produce that various and doubtful signification in the names of substances, which causes such uncertainty, disputes, or mistakes, when we come to a philosophical use of them.

§15. With this imperfection, they may serve for civil, but not well for philosophical use. 'Tis true, as to civil and common conversation, the general names of substances, regulated in their ordinary signification by some obvious qualities, (as by the shape and figure in things of known seminal propagation, and in other substances, for the most part by colour, joined with some other sensible qualities,) do well enough, to design the things men would be understood to speak of: and so they usually conceive well enough the substances meant by the word gold, or apple, to distinguish the one from the other. But in philosophical inquiries and debates, where general truths are to be established, and consequences drawn from positions laid down, there the precise signification of the names of substances will be found, not only not to be well established, but also very hard to be so. For example, he that shall make malleableness, or a certain degree of

fixedness, a part of his complex idea of gold, may make propositions concerning gold, and draw consequences from them, that will truly and clearly follow from gold, taken in such a signification: but yet such as another man can never be forced to admit, nor be convinced of their truth, who makes not malleableness, or the same degree of fixedness, part of that complex idea that the name gold, in his use of it, stands for.

§16. Instance, liquor. This is a natural and almost unavoidable imperfection in almost all the names of substances, in all languages whatsoever, which men will easily find, when once passing from confused or loose notions, they come to more strict and close inquiries. For then they will be convinced, how doubtful and obscure those words are in their signification, which in ordinary use appeared very clear and determined. I was once in a meeting of very learned and ingenious physicians, where by chance there arose a question, whether any liquor passed through the filaments of the nerves. The debate having been managed a good while, by variety of arguments on both sides, I (who had been used to suspect, that the greatest part of disputes were more about the signification of words, than a real difference in the conception of things) desired, that before they went any further on in this dispute, they would first examine, and establish amongst them, what the word liquor signified. They at first were a little surprised at the proposal; and had they been persons less ingenious, they might perhaps have taken it for a very frivolous or extravagant one: since there was no one there, that thought not himself to understand very perfectly, what the word liquor stood for; which, I think too, none of the most perplexed names of substances. However, they were pleased to comply with my motion, and upon examination found, that the signification of that word, was not so settled and certain, as they had all imagined; but that each of them made it a sign of a different complex idea. This made them perceive, that the main of their dispute was about the signification of that term; and that they differed very little in their opinions, concerning some fluid and subtle matter, passing through the conduits of the nerves; though it was not so easy to agree whether it was to be called liquor. or no, a thing which when considered, they thought it not worth the contending about.

§17. Instance gold. How much this is the case in the greatest part of disputes, that men are engaged so hotly in, I shall perhaps, have an

occasion in another place to take notice. Let us only here consider a little more exactly the forementioned instance of the word gold, and we shall see how hard 'tis precisely to determine its signification. I think all agree, to make it stand for a body of a certain yellow shining colour; which being the idea to which children have annexed that name, the shining yellow part of a peacock's tail, is properly to them gold. Others finding fusibility joined with that yellow colour in certain parcels of matter, make of that combination a complex idea to which they give the name gold to denote a sort of substances; and so exclude from being gold all such yellow shining bodies, as by fire will be reduced to ashes, and admit to be of that species, or to be comprehended under that name gold only such substances as, having that shining yellow colour will by fire be reduced to fusion, and not to ashes. Another by the same reason adds the weight, which being a quality, as straightly joined with that colour, as its fusibility, he thinks has the same reason to be joined in its idea, and to be signified by its name: and therefore the other made up of body, of such a colour and fusibility, to be imperfect; and so on of all the rest: wherein no one can show a reason, why some of the inseparable qualities, that are always united in nature, should be put into the nominal essence, and others left out: or why the word gold, signifying that sort, of body the ring on his finger is made of, should determine that sort rather by its colour, weight, and fusibility; than by its colour, weight, and solubility in aqua regia: since the dissolving it by that liquor, is as inseparable from it, as the fusion by fire; and they are both of them nothing but the relation which that substance has to two other bodies, which have a power to operate differently upon it. For by what right is it that fusibility comes to be a part of the essence signified by the word gold, and solubility but a property of it? Or why is its colour part of the essence, and its malleableness but a property? That which I mean, is this, that these being all but properties, depending on its real constitution, and nothing but powers, either active or passive, in reference to other bodies, no one has authority to determine the signification of the word gold, (as referred to such a body existing in nature) more to one collection of ideas to be found in that body, than to another: whereby the signification of that name must unavoidably be very uncertain. Since, as has been said, several people observe several properties in the same substance; and I think I may say nobody all. And therefore we have but very imperfect descriptions of things, and words have very uncertain significations.

§18. The names of simple ideas the least doubtful. From what has been said, 'tis easy to observe what has been before remarked, viz. that the names of simple ideas are, of all others the least liable to mistakes, and that for these reasons. First, Because the ideas they stand for, being each but one single perception, are much easier got, and more clearly retained, than the more complex ones, and therefore are not liable to the uncertainty which usually attends those compounded ones of substances and mixed modes, in which the precise number of simple ideas, that make them up are not easily agreed, so readily kept in mind. And Secondly, Because they are never referred to any other essence, but barely that perception they immediately signify: which reference is that which renders the signification of the names of substances naturally so perplexed, and gives occasion to so many disputes. Men that do not perversely use their words, or on purpose set themselves to cavil, seldom mistake in any language, which they are acquainted with, the use and signification of the name of simple ideas: White and sweet, yellow and bitter, carry a very obvious meaning with them, which every one precisely comprehends, or easily perceives he is ignorant of, and seeks to be informed. But what precise collection of simple ideas, modesty, or frugality stand for in another's use, is not so certainly known. And however we are apt to think, we well enough know, what is meant by gold or iron; yet the precise complex idea, others make them the signs of, is not so certain: and I believe 'tis very seldom that in speaker and hearer, they stand for exactly the same collection. Which must needs produce mistakes and disputes, when they are made use of in discourses, wherein men have to do with universal propositions, and would settle in their minds universal truths, and consider the consequences that follow from them.

§19. And next to them simple modes. By the same rule, the names of simple modes are next to those of simple ideas, least liable to doubt and uncertainty, especially those of figure and number, of which men have so clear and distinct ideas. Whoever, that had a mind to understand them, mistook the ordinary meaning of seven, or a triangle' And in general the least compounded ideas in every kind have the least dubious names.

§20. The most doubtful are the names of very compounded mixed modes and substances. Mixed modes therefore, that are made up but of a few and obvious simple ideas, have usually names of no very

uncertain signification. But the names of mixed modes, which comprehend a great number of simple ideas, are commonly of a very doubtful, and undetermined meaning, as has been shown. The names of substances, being annexed to ideas that are neither the real essences, nor exact representations of the patterns they are referred to, are liable to yet greater imperfection and uncertainty, especially when we come to a philosophical use of them.

§21. Why this imperfection charged upon words. The great disorder that happens in our names of substances, proceeding for the most part from our want of knowledge, and inability to penetrate into their real constitutions, it may probably be wondered, why I charge this as an imperfection, rather upon our words than understandings. This exception, has so much appearance of justice, that I think myself obliged to give a reason, why I have followed this method. I must confess then, that when I first began this discourse of the understanding, and a good while after, I had not the least thought, that any consideration of words was at all necessary to it. But when, having passed over the original and composition of our ideas, I began to examine the extent and certainty of our knowledge, I found it had so near a connexion with words, that unless their force and manner of signification were first well observed, there could be very little said clearly and pertinently concerning knowledge: which being conversant about truth, had constantly to do with propositions. And though it terminated in things, yet it was for the most part so much by the intervention of words, that they seemed scarce separable from our general knowledge. At least they interpose themselves so much between our understandings, and the truth, which it would contemplate and apprehend, that, like the medium through which visible objects pass, the obscurity and disorder do not seldom cast a mist before our eyes, and impose upon our understandings. If we consider, in the fallacies, men put upon themselves, as well as others, and the mistakes in men's disputes and notions, how great a part is owing to words, and their uncertain or mistaken significations, we shall have reason to think this no small obstacle in the way to knowledge, which I conclude we are the more carefully to be warned of, because it has been so far from being taken notice of as an inconvenience, that the arts of improving it have been made the business of men's study, and obtained the reputation of learning and subtilty, as we shall see in the following chapter. But I am apt to imagine, that were the imperfections of language, as the instrument of

knowledge, more thoroughly weighed, a great many of the controversies that make such a noise in the world, would of themselves cease; and the way to knowledge, and, perhaps, peace too, lie a great deal opener than it does.

§22. This should teach us moderation, in imposing our own sense of old authors. Sure I am, that the signification of words in all languages, depending very much on the thoughts, notions, and ideas of him that uses them, must unavoidably be of great uncertainty, to men of the same language and country. This is so evident in the Greek authors, that he, that shall peruse their writings, will find in almost every one of them, a distinct language, though the same words. But when to this natural difficulty in every country, there shall be added different countries, and remote ages, wherein the speakers and writers had very different notions, tempers, customs, ornaments, and figures of speech, etc. every one of which, influenced the signification of their words then, though to us now they are lost and unknown, it would become us to be charitable one to another in our interpretations or misunderstandings of those ancient writings, which though of great concernment to be understood, are liable to the unavoidable difficulties of speech, which, (if we except the names of simple ideas, and some very obvious things) is not capable, without a constant defining the terms of conveying the sense and intention of the speaker, without any manner of doubt and uncertainty, to the hearer. And in discourses of religion, law, and morality, as they are matters, of the highest concernment, so there will be the greatest difficulty.

§23. Especially of the Old and New Testament Scriptures. The volumes of interpreters, and commentators on the Old and New Testament, are but too manifest proofs of this. Though everything said in the text be infallibly true, yet the reader may be, nay cannot choose but be, very fallible in the understanding of it. Nor is it to be wondered, that the will of God, when clothed in words, should be liable to that doubt and uncertainty which unavoidably attends that sort of conveyance, when even his Son, whilst clothed in flesh, was subject to all the frailties and inconveniences of human nature, sin excepted. And we ought to magnify his goodness, that he hath spread before all the world, such legible characters of his works and providence, and given all mankind so sufficient a light of reason, that they to whom this written word never came, could not (whenever they set themselves to search) either doubt of the being of a God, or of

the obedience due to him. Since then the precepts of Natural Religion are plain, and very intelligible to all mankind, and seldom come to be controverted; and other revealed truths, which are conveyed to us by books and languages, are liable to the common and natural obscurities and difficulties incident to words, methinks it would become us to be more careful and diligent in observing the former, and less magisterial, positive, and imperious, in imposing our own sense and interpretations of the latter.

Chapter X Of the Abuse of Words

§1. Abuse of words. Besides the imperfection that is naturally in language, and the obscurity and confusion that is so hard to be avoided in the use of words, there are several wilful faults and neglects, which men are guilty of, in this way of communication, whereby they render these signs less clear and distinct in their signification, than naturally they need to be.

§2. First, words without any, or without clear ideas. First, in this kind, the first and most palpable abuse is, the using of words without clear and distinct ideas; or, which is worse, signs without anything signified. Of these there are two sorts:

I. One may observe, in all languages, certain words, if they be examined, will be found, in their first original, and their appropriated use, not to stand for any clear and distinct ideas. These, for the most part, the several sects of philosophy and religion have introduced. For their authors, or promoters, either affecting something singular, and out of the way of common apprehensions, or to support some strange opinions, or cover some weakness of their hypothesis, seldom fail to coin new words, and such as, when they come to be examined, may justly be called insignificant terms. For having either had no determinate collection of ideas annexed to them, when they were first invented; or at least such as, if well examined, will be found inconsistent, 'tis no wonder if afterwards, in the vulgar use of the same party, they remain empty sounds, with little or no signification, amongst those who think it enough to have them often in their mouths, as the distinguishing characters of their Church, or School, without much troubling their heads to examine what are the precise ideas they stand for. I shall not need here to heap up instances, everyone's reading and conversation will sufficiently furnish

him: Or if he wants to be better stored, the great mint-masters of these kind of terms, I mean the School-men and Metaphysicians, (under which, I think the disputing natural and moral philosophers of these latter ages, may be comprehended,) have wherewithal abundantly to content him.

§3. II. Other words, to which ideas were annexed at first, used afterwards without distinct meanings. Others there be, who extend this abuse yet further, who take so little care to lay by words, which in their primary notation have scarce any clear and distinct ideas which they are annexed to, that by an unpardonable negligence, they familiarly use words, which the propriety of language has affixed to very important ideas, without any distinct meaning at all. Wisdom, glory, grace, etc. are words frequent enough in every man's mouth; but if a great many of those who use them, should be asked, what they mean by them' they would be at a stand, and not know what to answer: a plain proof, that though they have learned those sounds, and have them ready at their tongues, ends, yet there are no determined ideas laid up in their minds, which are to be expressed to others by them.

§4. Occasioned by learning names before the ideas they belong to. Men, having been accustomed from their cradles to learn words, which are easily got and retained, before they knew, or had framed the complex ideas, to which they were annexed, or which were to be found in the things they were thought to stand for, they usually continue to do so all their lives, and without taking the pains necessary to settle in their minds determined ideas, they use their words for such unsteady and confused notions as they have, contenting themselves with the same words other people use; as if their very sound necessarily carried with it constantly the same meaning. This, though men make a shift with, in the ordinary occurrences of life, where they find it necessary to be understood, and therefore they make signs till they are so: yet this insignificancy in their words, when they come to reason concerning either their tenets or interest, manifestly fills their discourse with abundance of empty unintelligible noise and jargon, especially in moral matters, where the words, for the most part, standing for arbitrary and numerous collections of ideas, not regularly and permanently united in nature, their bare sounds are often only thought on, or at least very obscure and uncertain notions annexed to them. Men take the words they find in use amongst their neighbors;

and that they may not seem ignorant what they stand for, use them confidently, without much troubling their heads about a certain fixed meaning; whereby, besides the ease of it, they obtain this advantage, that as in such discourses they seldom are in the right, so they are as seldom to be convinced, that they are in the wrong; it being all one to go about to draw those men out of their mistakes, who have no settled notions, as to dispossess a vagrant of his habitation who has no settled abode. This I guess to be so; and every one may observe in himself and others, whether it be, or no.

§5. Secondly, unsteady application of them. Secondly, another great abuse of words is, inconstancy in the use of them. 'Tis hard to find a discourse written of any subject, especially of controversy, wherein one shall not observe, if he read with attention, the same words (and those commonly the most material in the discourse, and upon which the argument turns) used sometimes for one collection of simple ideas, and sometimes for another; which is a perfect abuse of language. Words being intended for signs of my ideas, to make them known to others, not by any natural signification, but by a voluntary imposition, 'tis plain cheat and abuse, when I make them stand sometimes for one thing and sometimes for another; the wilful doing whereof, can be imputed to nothing but great folly, or greater dishonesty. And a man, in his accounts with another, may, with as much fairness, make the characters of numbers stand sometimes for one, and sometimes for another collection of units: v.g. this character 3 stand sometimes for three, sometimes for four, and sometimes for eight; as in his discourse, or reasoning, make the same words stand for different collections of simple ideas. If men should do so in their reckonings, I wonder who would have to do with them? One who would speak thus in the affairs and business of the world, and call 8 sometimes seven, and sometimes nine, as best served his advantage, would presently have clapped upon him one of the two names men are commonly disgusted with. And yet in arguings and learned contests, the same sort of proceedings passes commonly for wit and learning: but to me it appears a greater dishonesty, than the misplacing of counters, in the casting up a debt; and the cheat the greater, by how much truth is of greater concernment and value, than money.

§6. Thirdly, affected obscurity by wrong application. Thirdly, another abuse of language is, an affected obscurity, by either

applying old words, to new and unusual significations; or introducing new and ambiguous terms, without defining either; or else putting them so together, as may confound their ordinary meaning. Though the Peripatetick philosophy has been most eminent in this way, yet other sects have not been wholly clear of it. There are scarce any of them that are not cumbered with some difficulties, (such is the imperfection of human knowledge,) which they have been fain to cover with obscurity of terms, and to confound the signification of words, which, like a mist before people's eyes, might hinder their weak parts from being discovered. That body and extension, in common use, stand for two distinct ideas, is plain to any one that will but reflect a little. For were their signification precisely the same, it would be as proper, and as intelligible to say, the body of an extension, as the extension of a body; and yet there are those who find it necessary to confound their signification. To this abuse, and the mischiefs of confounding the signification of words, logic, and the liberal sciences as they have been handled in the schools, have given reputation; and the admired Art of Disputing hath added much to the natural imperfection of languages, whilst it has been made use of, and fitted, to perplex the signification of words, more than to discover the knowledge and truth of things: and he that will look into that sort of learned writings, will find the words there much more obscure, uncertain, and undetermined in their meaning, than they are in ordinary conversation.

§7. Logic and dispute have much contributed to this. This is unavoidably to be so, where men's parts and learning are estimated by their skill in disputing. And if reputation and reward shall attend these conquests, which depend mostly on the fineness and niceties of words, 'tis no wonder if the wit of man so employed, should perplex, involve, and subtilize the signification of sounds, so as never to want something to say, in opposing or defending any question; the victory being adjudged not to him who had truth on his side, but the last word in the dispute.

§8. Calling it subtlety. This, though a very useless skin, and that which I think the direct opposite to the ways of knowledge, hath yet passed hitherto under the laudable and esteemed names of subtlety and acuteness, and has had the applause of the schools, and encouragement of one part of the learned men of the world. And no wonder, since the philosophers of old, (the disputing and wrangling

philosophers I mean, such as Lucian wittily, and with reason taxes,)and the Schoolmen since, aiming at glory and esteem, for their great and universal knowledge, easier a great deal to be pretended to than really acquired, found this a good expedient to cover their ignorance,with a curious and inexplicable web of perplexed words, and procure to themselves the admiration of others, by unintelligible terms, the apter to produce wonder, because they could not be understood:whilst it appears in all history, that these profound doctors were no wiser, nor more useful than their neighbours; and brought but small advantage to human life, or the societies, wherein they lived: unless the coining of new words, where they produced no new things to apply them to, or the perplexing or obscuring the signification of old ones, and so bringing all things into question and dispute, were a thing profitable to the life of man, or worthy commendation and reward.

§9. This learning very little benefits society. For, notwithstanding these learned disputants, these allknowing doctors, it was to the unscholastic statesman, that the governments of the world owed their peace, defence, and liberties; and from the illiterate and contemned mechanic, (a name of disgrace) that they received the improvements of useful arts. Nevertheless, this artificial ignorance,and learned gibberish, prevailed mightily in these last ages, by the interest and artifice of those, who found no easier way to that pitch of authority and dominion they have attained, than by amusing the men of business, and ignorant, with hard words, or employing the ingenious and idle in intricate disputes, about unintelligible terms,and holding them perpetually entangled in that endless labyrinth.Besides, there is no such way to gain admittance, or give defence to strange and absurd doctrines, as to guard them round about with legions of obscure, doubtful, and undefined words. Which yet make these retreats, more like the dens of robbers, or holes of foxes, than the fortresses of fair warriors: which if it be hard to get them out of,'tis not for the strength that is in them, but the briars and thorns,and the obscurity of the thickets they are beset with. For untruth being unacceptable to the mind of man, there is no other defence left for absurdity but obscurity.

§10. But destroys the instruments of knowledge and communication.Thus learned ignorance, and this art of keeping even inquisitive men,from true knowledge, hath been propagated in the world, and hath much perplexed, whilst it pretended to inform the

understanding. For we see, that other wellmeaning and wise men, whose education and parts had not acquired that acuteness, could intelligibly express themselves to one another; and in its plain use, make a benefit of language. But though unlearned men well enough understood the words white and black, etc. and had constant notions of the ideas signified by those words; yet there were philosophers found, who had learning and subtlety enough to prove that snow was black; i.e. to prove, that white was black. Whereby they had the advantage to destroy the instruments and means of discourse, conversation, instruction, and society; whilst, with great art and subtlety they did no more but perplex and confound the signification of words, and thereby render language less useful than the real defects of it had made it, a gift which the illiterate had not attained to.

§11. As useful as to confound the sounds of the letters. These learned men did equally instruct men's understandings, and profit their lives, as he who should alter the signification of known characters, and, by a subtle device of learning, far surpassing the capacity of the illiterate, dull, and vulgar, should, in his writing show that he could put A for B, and D for E, etc. to the no small admiration and benefit of his reader. It being as senseless to put black, which is a word agreed on to stand for one sensible idea, to put it, I say, for another, or the contrary idea; i.e. to call snow black, as to put this mark A. which is a character agreed on to stand for one modification of sound, made by a certain motion of the organs of speech, for B. which is agreed on to stand for another modification of sound, made by another certain mode of the organs of speech.

§12. This art has perplexed religion and justice. Nor hath this mischief stopped in logical niceties, or curious empty speculations; it hath invaded the great concernments of human life and society; obscured and perplexed the material truths of law and divinity; brought confusion, disorder, and uncertainty into the affairs of mankind; and if not destroyed, yet in a great measure rendered useless, these two great rules, religion and justice. What have the greatest part of the comments and disputes, upon the laws of God and man served for, but to make the meaning more doubtful, and perplex the sense? What have been the effect of those multiplied curious distinctions, and acute niceties, but obscurity and uncertainty, leaving the words more unintelligible, and the reader more at a loss? How else comes it to pass, that princes, speaking or writing to their servants, in

their ordinary commands are easily understood; speaking to their people, in their laws, are not so' And, as I remarked before, doth it not often happen, that a man of an ordinary capacity, very well understands a text, or a law, that he reads, till he consults an expositor, or goes to counsel; who, by that time he hath done explaining them, makes the words signify either nothing at all, or what he pleases.

§13. And ought not to pass for learning. Whether any by-interests of these professions have occasioned this, I will not here examine; but I leave it to be considered, whether it would not be well for mankind, whose concernment 'tis to know things as they are, and to do what they ought, and not to spend their lives in talking about them, or tossing words to and fro; whether it would not be well, I say, that the use of words were made plain and direct; and that language, which was given us for the improvement of knowledge, and bond of society, should not be employed to darken truth, and unsettle people's rights; to raise mists, and render unintelligible both morality and religion' Or that at least, if this will happen, it should not be thought learning or knowledge to do so'

§14. Fourthly, taking them for things. Fourthly, Another great abuse of words is, the taking them for things. This, though it in some degree, concerns all names in general; yet more particularly affects those of substances. To this abuse, those men are most subject, who confine their thoughts to any one system, and give themselves up into a firm belief of the perfection of any received hypothesis: whereby they come to be persuaded that the terms of that sect are so suited to the nature of things, that they perfectly correspond with their real existence. Who is there that has been bred up in the Peripatetick philosophy, who does not think the Ten Names, under which are ranked the Ten Predicaments, to be exactly conformable to the nature of things' Who is there, of that school, that is not persuaded that substantial forms, vegetative souls, abhorrence of a vacuum, intentional species, etc. are something real' These words men have learned from their very entrance upon knowledge, and have found their masters and systems lay great stress upon them: and therefore they cannot quit the opinion, that they are conformable to nature, and are the representations of something that really exists. The Platonists have their soul of the world, and the Epicureans their endeavour towards motion in their atoms, when at rest. There is scarce any sect in philosophy has not a distinct set of terms that others understand

not. But yet this gibberish, which in the weakness of human understanding, serves so well to palliate men's ignorance, and cover their errors, comes by familiar use amongst those of the same tribe, to seem the most important part of language, and of all other the terms the most significant: and should aerial and aetherial vehicles come once, by the prevalency of that doctrine, to be generally received anywhere, no doubt those terms would make impressions on men's minds, so as to establish them in the persuasion of the reality of such things, as much as Peripatetick forms, and intentional species have heretofore done.

§15. Instance in matter. How much names taken for things, are apt to mislead the understanding, the attentive reading of philosophical writers would abundantly discover; and that, perhaps, in words little suspected of any such misuse. I shall instance in one only, and that a very familiar one. How many intricate disputes have there been about matter, as if there were some such thing really in nature, distinct from body; as 'tis evident the word matter stands for an idea distinct from the idea of body' For if the ideas these two terms stood for, were precisely the same, they might indifferently in all places be put for one another. But we see, that though it be proper to say, There is one matter of all bodies, one cannot say, There is one body of all matters: we familiarly say, one body is bigger than another, but it sounds harsh (and I think is never used) to say, one matter is bigger than another. Whence comes this, then' Viz. from hence, that though matter and body, be not really distinct, but wherever there is the one, there is the other; yet matter and body, stand for two different conceptions, whereof the one is incomplete, and but a part of the other. For body stands for a solid extended figured substance, whereof matter is but a partial and more confused conception, it seeming to me to be used for the substance and solidity of body, without taking in its extension and figure: and therefore 'tis that speaking of matter, we speak of it always as one, because in truth it expressly contains nothing but the idea of a solid substance, which is everywhere the same, everywhere uniform. This being our idea of matter, we no more conceive, or speak of different matters in the world, than we do of different solidities; though we both conceive and speak of different bodies, because extension and figure are capable of variation. But since solidity cannot exist without extension, and figure, the taking matter to be the name of something really existing under that precision, has no doubt produced those obscure and unintelligible

discourses and disputes, which have filled the heads and books of philosophers concerning *materia prima*; which imperfection or abuse, how far it may concern a great many other general terms, I leave to be considered. This, I think, I may at least say, that we should have a great many fewer disputes in the world, if words were taken for what they are, the signs of our ideas only, and not for things themselves. For when we argue about matter, or any the like term, we truly argue only about the idea we express by that sound, whether that precise idea agree to anything really existing in nature, or no. And if men would tell what ideas they make their words stand for, there could not be half that obscurity or wrangling in the search or support of truth, that there is.

§16. This makes errors lasting. But whatever inconvenience follows from this mistake of words, this I am sure, that, by constant and familiar use, they charm men into notions far remote from the truth of things. 'Twould be a hard matter, to persuade any, one, that the words which his father or schoolmaster, the parson of the parish, or such a reverend doctor used, signified nothing that really existed in nature: which perhaps, is none of the least causes, that men are so hardly drawn to quit their mistakes, even in opinions purely philosophical, and where they have no other interest but truth. For the words, they have a long time been used to, remaining firm in their minds, 'tis no wonder that the wrong notions annexed to them, should not be removed.

§17. Fifthly, setting them for what they cannot signify. Fifthly, another abuse of words, is the setting them in the place of things which they do or can by no means signify. We may observe, that in the general names of substances, whereof the nominal essences are only known to us, when we put them into propositions, and affirm or deny anything about them, we do most commonly tacitly suppose, or intend, they should stand for the real essence of a certain sort of substances. For when a man says gold is malleable, he means and would insinuate something more than this, That what I call gold is malleable, (though truly it amounts to no more) but would have this understood, viz. That gold, i.e. what has the real essence of gold, is malleable, which amounts to thus much, that malleableness depends on, and is inseparable from the real essence of gold. But a man, not knowing wherein that real essence consists, the connexion in his mind of malleableness, is not truly with an essence he knows not, but only

with the sound gold he puts for it. Thus when we say, that animal rational is, and animal implume bipes latis unguibus, is not a good definition of a man; 'tis plain we suppose the name man in this case to stand for the real essence of a species, and would signify, that a rational animal better described that real essence than a twolegged animal with broad nails, and without feathers. For else, why might not Plato as properly make the word a'νqrwno' or man stand for his complex idea, made up of the idea of a body, distinguished from others by a certain shape and other outward appearances, as Aristotle make the complex idea, to which he gave the name a'νqrwno' or man, of body and the faculty of reasoning joined together; unless the name a'νqrwno', or man, were supposed to stand for something else, than what it signifies; and to be put in the place of some other thing, than the idea a man professes he would express by it'

§18. V.g. Putting them for the real essences of substances. 'Tis true, the names of substances would be much more useful, and propositions made in them much more certain, were the real essences of substances the ideas in our minds, which those words signified. And 'tis for want of those real essences, that our words convey so little knowledge or certainty in our discourses about them: and therefore the mind, to remove that imperfection as much as it can, makes them, by a secret supposition, to stand for a thing having that real essence, as if thereby it made some nearer approaches to it. For though the word man or gold, signify nothing truly but a complex idea of properties, united together in one sort of substances: yet there is scarce anybody in the use of these words, but often supposes each of those names to stand for a thing having the real essence, on which these properties depend. Which is so far from diminishing the imperfection of our words, that by a plain abuse it adds to it, when we would make them stand for something, which not being in our complex idea, the name we use can no ways be the sign of.

§19. Hence we think every change of our ideas in substances, not to change their species. This shows us the reason, why in mixed modes any of the ideas that make the composition of the complex one, being left out, or changed, 'tis allowed to be another thing, i.e. to be of another species, as is plain in chance-medley,¹⁵ manslaughter, murder, parricide, etc. The reason whereof is, because the complex idea signified by that name, is the real, as well as nominal essence; and there is no secret reference of that name to any other essence, but

that. But in substances, 'tis not so. For though in that called gold one puts into his complex idea, what another leaves out; and vice versa: yet men do not usually think that therefore the species is changed: because they secretly in their minds refer that name, and suppose it annexed to a real immutable essence of a thing existing, on which those properties depend. He that adds to his complex idea of gold, that of fixedness and solubility in aqua regia, which he put not in it before, is not thought to have changed the species; but only to have a more perfect idea, by adding another simple idea, which is always in fact joined with those other, of which his former complex idea consisted. But this reference of the name to a thing, whereof we have not the idea, is so far from helping at all, that it only serves the more to involve us in difficulties. For by this tacit reference to the real essence of that species of bodies, the word gold (which, by standing for a more or less perfect collection of simple ideas, serves to design that sort of body well enough in civil discourse) comes to have no signification at all, being put for somewhat whereof we have no idea at all, and so can signify nothing at all, when the body itself is away. For however it may be thought all one; yet, if well considered, it will be found a quite different thing, to argue about gold in name, and about a parcel in the body itself, v.g. a piece of leaf-gold laid before us; though in discourse we are fain to substitute the name for the thing.

§20. The cause of the abuse, a supposition of nature's working always regularly. That which, I think very much disposes men to substitute their names for the real essences of species, is the supposition before mentioned, that nature works regularly in the production of things, and sets the boundaries to each of those species, by giving exactly the same real internal constitution to each individual, which we rank under one general name. Whereas anyone who observes their different qualities can hardly doubt, that many of the individuals, called by the same name, are, in their internal constitution, as different one from another, as several of those which are ranked under different specific names. This supposition, however that the same precise and internal constitution goes always with the same specific name, makes men forward to take those names for the representatives of those real essences, though indeed they signify nothing but the complex ideas they have in their minds, when they use them. So that, if I may so say, signifying one thing, and being supposed for, or put in the place of another, they cannot but, in such a kind of use, cause a great deal of uncertainty in men's

discourses; especially in those, who have thoroughly imbibed the doctrine of substantial forms, whereby they firmly imagine the several species of things to be determined and distinguished.

§21. This abuse contains two false suppositions. But however preposterous and absurd it be, to make our names stand for ideas we have not, or (which is all one) essences that we know not, it being in effect to make our words the signs of nothing; yet 'tis evident to anyone who ever so little reflects on the use men make of their words, that there is nothing more familiar. When a man asks, whether this or that thing he sees, let it be a drill, or a monstrous foetus, be a man or no; 'tis evident the question is not, Whether that particular thing agree to his complex idea expressed by the name man: but whether it has in it the real essence of a species of things, which he supposes his name man to stand for. In which way of using the names of substances, there are these false suppositions contained.

First, that there are certain precise essences, according to which nature makes all particular things, and by which they are distinguished into species. That everything has a real constitution, whereby 'tis what it is, and on which its sensible qualities depend, is past doubt: But I think it has been proved that this makes not the distinction of species, as we rank them; nor the boundaries of their names.

Secondly, this tacitly also insinuates, as if we had ideas of these proposed essences. For to what purpose else is it, to inquire whether this or that thing have the real essence of the species man, if we did not suppose that there were such a specific essence known? Which yet is utterly false. And therefore such application of names, as would make them stand for ideas which we have not, must needs cause great disorder in discourses and reasonings about them, and be a great inconvenience in our communication by words.

§22. Sixthly, a proceeding that words have a certain and evident signification, Sixthly, there remains yet another more general, though perhaps, less observed abuse of words; and that is, that men having by a long and familiar use annexed to them certain ideas, they are apt to imagine so near and necessary a connexion between the names and the signification they use them in, that they forwardly suppose one cannot but understand what their meaning is; and therefore one ought to acquiesce in the words delivered, as if it were past doubt that in the

use of those common received sounds, the speaker and hearer had necessarily the same precise ideas. Whence presuming, that when they have in discourse used any term, they have thereby, as it were, set before others the very thing they talked of. And so likewise taking the words of others as naturally standing for just what they themselves have been accustomed to apply them to, they never trouble themselves to explain their own, or understand clearly others' meaning. From whence commonly proceeds noise, and wrangling, without improvement or information; whilst men take words to be the constant regular marks of agreed notions, which in truth are no more but the voluntary and unsteady signs of their own ideas. And yet men think it strange, if in discourse, or (where 'tis often absolutely necessary) in dispute, one sometimes asks the meaning of their terms: though the arguings one may every day observe in conversation, make it evident, that there are few names of complex ideas, which any two men use for the same just precise collection. 'Tis hard to name a word, which will not be a clear instance of this. Life is a term, none more familiar. Any one almost would take it for an affront, to be asked what he meant by it. And yet if it comes in question, whether a plant, that lies ready formed in the seed, have life; whether the embryo in an egg before incubation, or a man in a swoon without sense or motion, be alive or no 'tis easy to perceive, that a clear distinct settled idea does not always accompany the use of so known a word, as that of life is. Some gross and confused conceptions men indeed ordinarily have, to which they apply the common words of their language; and such a loose use of their words serves them well enough in their ordinary discourses or affairs. But this is not sufficient for philosophical inquiries. Knowledge and reasoning require precise determinate ideas. And though men will not be so importunately dull, as not to understand what others say, without demanding an explication of their terms; nor so troublesomely critical as to correct others in the use of the words they receive from them: yet where truth and knowledge are concerned in the case, I know not what fault it can be to desire the explication of words, whose sense seems dubious; or why a man should be ashamed to own his ignorance, in what sense another man uses his words, since he has no other way of certainly knowing it but by being informed. This abuse of taking words upon trust, has nowhere spread so far, nor with so ill effects, as amongst men of letters. The multiplication and obstinacy of disputes, which have so laid waste the intellectual world, is owing to nothing more, than to this ill use of words. For though it be generally believed, that there is great

diversity of opinions in the volumes and variety of controversies, the world is distracted with; yet the most I can find, that the contending learned men of different parties do, in their arguings one with another, is, that they speak different languages. For I am apt to imagine, that when any of them quitting terms, think upon things, and know what they think, they think all the same: though perhaps, what they would have been different.

§23. The ends of language, first, to convey our ideas. To conclude this consideration of the imperfection, and abuse of language. The ends of language in our discourse with others, being chiefly these three: first, to make known one man's thoughts or ideas to another. Secondly, to do it with as much ease and quickness, as possible; and thirdly, thereby to convey the knowledge of things. language is either abused, or deficient, when it fails of any of these three.

First, words fail in the first of these ends, and lay not open one man's ideas to another's view. First, when men have names in their mouths without any determinate ideas in their minds, whereof they are the signs: or secondly, when they apply the common received names of any language to ideas, to which the common use of that language does not apply them: or thirdly, when they apply them very unsteadily, making them stand, now for one, and by and by for another idea.

§24. Secondly, to do it with quickness. Secondly, men fail of conveying their thoughts, with all the quickness and ease that may be, when they have complex ideas, without having distinct names for them. This is sometimes the fault of the language itself, which has not in it a sound yet applied to such a signification: and sometimes the fault of the man, who has not yet learned the name for that idea he would show another.

§25. Thirdly, therewith to convey the knowledge of things. Thirdly, there is no knowledge of things conveyed by men's words, when their ideas agree not to the reality of things. Though it be a defect, that has its original in our ideas, which are not so conformable to the nature of things, as attention, study, and application might make them: yet it fails not to extend itself to our words too, when we use them as signs of real beings, which yet never had any reality or existence.

§26. How men's words fail in all these. First, he that hath words of any language, without distinct ideas in his mind to which he applies them, does, so far as he uses them in discourse, only make a noise without any sense or signification; and how learned soever he may seem by the use of hard words, or learned terms, is not much more advanced thereby in knowledge, than he would be in learning, who had nothing in his study but the bare titles of books, without possessing the contents of them. For all such words, however put into discourse, according to the right construction of grammatical rules, or the harmony of wellturned periods, do yet amount to nothing but bare sounds, and nothing else.

§27. Secondly, he that has complex ideas, without particular names for them, would be in no better case than a bookseller, who had in his warehouse volumes that lay there unbound, and without titles; which he could therefore make known to others, only by showing the loose sheets, and communicate them only by tale. This man is hindered in his discourse, for want of words to communicate his complex ideas, which he is therefore forced to make known by an enumeration of the simple ones that compose them; and so is fain often to use twenty words, to express what another man signifies in one.

§28. Thirdly, he that puts not constantly the same sign for the same idea, but uses the same words sometimes in one, and sometimes in another signification, ought to pass in the schools and conversation, for as fair a man, as he does in the market and exchange, who sells several things under the same name.

§29. Fourthly, he that applies the words of any language to ideas, different from those, to which the common use of that country applies them, however his own understanding may be filled with truth and light, will not by such words be able to convey much of it to others, without defining his terms. For however, the sounds are such as are familiarly known, and easily enter the ears of those who are accustomed to them; yet standing for other ideas than those they usually are annexed to, and are wont to excite in the mind of the hearers, they cannot make known the thoughts of him who thus uses them.

§30. Fifthly, he that imagined to himself substances such as never have been, and filled his head with ideas which have not any

correspondence with the real nature of things, to which yet he gives settled and defined names, may fill his discourse, and perhaps, another man's head with the fantastical imaginations of his own brain; but will be very far from advancing thereby one jot in real and true knowledge.

§31. He that hath names without ideas, wants meaning in his words, and speaks only empty sounds. He that hath complex ideas without names for them, wants liberty and dispatch in his expressions, and is necessitated to use periphrases. He that uses his words loosely and unsteadily, will either be not minded, or not understood. He that applies his names to ideas, different from their common use, wants propriety in his language, and speaks gibberish. And he that hath the ideas of substances, disagreeing with the real existence of things, so far wants the materials of true knowledge in his understanding, and hath, instead thereof chimeras.

§32. How in substances tarantula. In our notions concerning Substances, we are liable to all the former inconveniences: v.g. 1. he that uses the word without having any imagination or idea of what it stands for, pronounces a good word; but so long means nothing at all by it. 2. He that, in a new-discovered country, shall see several sorts of animals and vegetables, unknown to him before, may have as true ideas of them, as of a horse, or a stag; but can speak of them only by a description, till he shall either take the names the natives call them by, or give them names himself. 3. He that uses the word body sometimes for pure extension, and sometimes for extension and solidity together, will talk very fallaciously. 4. He that gives the name horse, to that idea which common usage calls mule, talks improperly, and will not be understood. 5. He that thinks the name centaur stands for some real being, imposes on himself, and mistakes words for things.

§33. How in modes and relations. In modes and relations generally, we are liable only to the four first of these inconveniences; (viz.) 1. I may have in my memory the names of modes, as gratitude, or charity, and yet not have any precise ideas annexed in my thoughts to those names. 2. I may have ideas, and not know the names that belong to them; v.g. I may have the idea of a man's drinking, till his colour and humour be altered, till his tongue trips, and his eyes look red, and his feet fail him; and yet not know, that 'tis to be called

drunkenness. 3. I may have the ideas of virtues or vices, and names also, but apply them amiss: v.g. when I apply the name frugality to that idea which others call and signify by this sound, covetousness. 4. I may use any of those names with inconstancy. 5. But in modes and relations, I cannot have ideas disagreeing to the existence of things: for modes being complex ideas, made by the mind at pleasure; and relation being but by way of considering, or comparing two things together, and so also an idea of my own making, these ideas can scarce be found to disagree with anything existing; since they are not in the mind, as the copies of things regularly made by nature, nor as properties inseparably flowing from the internal constitution or essence of any substance; but, as it were, patterns lodged in my memory, with names annexed to them, to denominate actions and relations by, as they come to exist. But the mistake is commonly in my giving a wrong name to my conceptions; and so using words in a different sense from other people. I am not understood, but am thought to have wrong ideas of them, when I give wrong names to them. Only if I put in my ideas of mixed modes or relations, any inconsistent ideas together, I fill my head also with chimeras; since such ideas, if well examined, cannot so much as exist in the mind, much less any real being, be ever denominated from them.

§34. Seventhly, figurative speech also an abuse of language. Since wit and fancy find easier entertainment in the world than dry truth and real knowledge, figurative speeches, and allusion in language will hardly be admitted, as an imperfection or abuse of it. I confess, in discourses, where we seek rather pleasure and delight, than information and improvement, such ornaments as are borrowed from them, can scarce pass for faults. But yet, if we would speak of things as they are, we must allow, that all the art of rhetoric, besides order and clearness, all the artificial and figurative application of words eloquence hath invented, are for nothing else but to insinuate wrong ideas, move the passions, and thereby mislead the judgment; and so indeed are perfect cheats: and therefore however laudable or allowable oratory may render them in harangues and popular addresses, they are certainly, in all discourses that pretend to inform or instruct, wholly to be avoided; and where truth and knowledge are concerned, cannot but be thought a great fault, either of the language or person that makes use of them. What, and how various they are, will be superfluous here to take notice; the books of rhetoric which abound in the world, will instruct those who want to be informed:

only I cannot but observe, how little the preservation and improvement of truth and knowledge, is the care and concern of mankind; since the arts of fallacy are endowed and preferred.'Tis evident how much men love to deceive, and be deceived, since rhetoric, that powerful instrument of error and deceit, has its established professors, is publicly taught, and has always been had in great reputation: and, I doubt not, but it will be thought great boldness, if not brutality in me to have said thus much against it. Eloquence, like the fair sex, has too prevailing beauties in it, to suffer itself ever to be spoken against. And 'tis in vain to find fault with those arts of deceiving, wherein men find pleasure to be deceived.

Chapter XI Of the Remedies of the foregoing Imperfections and Abuses

§1. They are worth seeking. The natural and improved imperfections of language, we have seen above at large: and speech being the great bond that holds society together, and the common conduit, whereby the improvements of knowledge are conveyed from one man, and one generation to another, it would well deserve our most serious thoughts, to consider what remedies are to be found for these inconveniences above-mentioned.

§2. Are not easy. I am not so vain to think, that anyone can pretend to attempt the perfect reforming the languages of the world, no not so much as that of his own country, without rendering himself ridiculous. To require that men should use their words constantly in the same sense, and for none but determined and uniform ideas, would be to think that all men should have the same notions, and should talk of nothing but what they have clear and distinct ideas of. Which is not to be expected by anyone, who hath not vanity enough to imagine he can prevail with men to be very knowing or very silent. And he must be very little skilled in the world, who thinks that a voluble tongue, shall accompany only a good understanding; or that men's talking much or little, should hold proportion only to their knowledge.

§3. But yet necessary to philosophy. But though the market and exchange must be left to their own ways of talking, and gossipings not be robbed of their ancient privilege: though the schools, and men of

argument would perhaps take it amiss to have anything offered, to abate the length, or lessen the number of their disputes; yet, methinks those, who pretend seriously to search after, or maintain truth, should think themselves obliged to study, how they might deliver themselves without obscurity, doubtfulness, or equivocation, to which men's words are naturally liable, if care be not taken.

§4. Misuse of words the cause of great errors. For he that shall well consider the errors and obscurity, the mistakes and confusion, that is spread in the world by an ill use of words, will find some reason to doubt, whether language, as it has been employed, has contributed more to the improvement or hindrance of knowledge amongst mankind. How many are there, that when they would think on things, fix their thoughts only on words, especially when they would apply their minds to moral matters? And who then can wonder, if the result of such contemplations and reasonings, about little more than sounds, whilst the ideas they annex to them, are very confused, or very unsteady, or perhaps none at all; who can wonder, I say, that such thoughts and reasonings, end in nothing but obscurity and mistake, without any clear judgment or knowledge?

§5. Obstinacy. This inconvenience, in an ill use of words, men suffer in their own private meditations: but much more manifest are the disorders which follow from it, in conversation, discourse, and arguing with others. For language being the great conduit, whereby men convey their discoveries, reasonings, and knowledge, from one to another, he that makes an ill use of it, though he does not corrupt the fountains of knowledge, which are in things themselves, yet he does, as much as in him lies, break or stop the pipes whereby 'tis distributed to the public use and advantage of mankind. He that uses words without any clear and steady meaning, what does he but lead himself and others into errors? And he that designedly does it, ought to be looked on as an enemy to truth and knowledge. And yet, who can wonder, that all the sciences and parts of knowledge, have been so overcharged with obscure and equivocal terms, and insignificant and doubtful expressions, capable to make the most attentive or quicksighted very little, or not at all the more knowing or orthodox; since subtlety, in those who make profession to teach or defend truth, hath passed so much for a virtue: a virtue, indeed, which consisting, for the most part, in nothing but the fallacious and illusory use of obscure or deceitful terms, is only fit to make men conceited in their ignorance,

and obstinate in their errors.

§6. And wrangling. Let us look into the books of controversy of any kind, there we shall see, that the effect of obscure, unsteady, or equivocal terms, is nothing but noise and wrangling about sounds, without convincing or bettering a man's understanding. For if the idea be not agreed on, betwixt the speaker and hearer, for which the words stand, the argument is not about things, but names. As often as such a word, whose signification is not ascertained betwixt them, comes in use, their understandings have no other object wherein they agree, but barely the sound, the things, that they think on at that time as expressed by that word, being quite different.

§7. Instance bat and bird. Whether a bat be a bird, or no, is not a question, Whether a bat be another thing than indeed it is, or have other qualities than indeed it has, for that would be extremely absurd to doubt of: but the question is, (1) either between those that acknowledged themselves to have but imperfect ideas of one or both of that sorts of things, for which these names are supposed to stand; and then 'tis a real inquiry, concerning the nature of a bird, or a bat, to make their yet imperfect ideas of it more complete, by examining, whether all the simple ideas, to which combined together, they both give the name bird, be all to be found in a bat: but this is a question only of inquirers, (not disputers,) who neither affirm, nor deny, but examine: or, (2) 'tis a question between disputants; whereof the one affirms, and the other denies, that a bat is a bird. And then the question is barely about the signification of one, or both these words; in that they not having both the same complex ideas, to which they give these two names, one holds, and t'other denies, that these two names may be affirmed one of another. Were they agreed in the signification of these two names, it were impossible they should dispute about them. For they would presently and clearly see, (were that adjusted between them,) whether all the simple ideas, of the more general name bird, were found in the complex idea of a bat, or no; and so there could be no doubt, whether a bat were a bird, or no. And here I desire it may be considered, and carefully examined, whether the greatest part of the disputes in the world, are not merely verbal, and about the signification of words; and whether if the terms they are made in were defined, and reduced in, their signification (as they must be where they signify anything) to determined collections of the simple ideas they do or should stand for,

those disputes would not end of themselves, and immediately vanish. I leave it then to be considered, what the learning of disputation is, and how well they are employed for the advantage of themselves or others, whose business is only the vain ostentation of sounds; i.e. those who spend their lives in disputes and controversies. When I shall see any of those combatants, strip all his terms of ambiguity and obscurity,(which everyone may do in the words he uses himself) I shall think him a champion for knowledge, truth, and peace, and not the slave of vain-glory, ambition, or a party.

§8. First, remedy to use no word without an idea. To remedy the defects of speech before-mentioned, to some degree, and to prevent the inconveniences that follow from them, I imagine, the observation of these following rules may be of use, till somebody better able shall judge it worth his while, to think more maturely on this matter, and oblige the world with his thoughts on it.

First, a man should take care to use no word without a signification, no name without an idea for which he makes it stand.

This rule will not seem altogether needless, to anyone who shall take the pains to recollect how often he has met with such words,as instinct, sympathy, and antipathy, etc. in the discourse of others, so made use of as he might easily conclude, that those that used them,had no ideas in their minds to which they applied them; but spoke them only as sounds, which usually served instead of reasons, on the like occasions. Not but that these words, and the like, have very proper significations in which they may be used; but there being no natural connexion between any words, and any ideas, these, and any other, may be learned by rote, and pronounced or writ by men who have no ideas in their minds, to which they have annexed them, and for which they make them stand; which is necessary they should, if men would speak intelligibly even to themselves alone.

§9. Secondly, to have distinct ideas annexed to them in modes.Secondly, 'tis not enough a man uses his words as signs of some ideas,those ideas he annexes them to, if they be simple, must be clear and distinct; if complex, must be determinate, i.e. the precise collection of simple ideas settled in the mind, with that sound annexed to it, as the sign of that precise determined collection, and no other. This is very necessary in names of modes, and especially moral words;which having no settled objects in nature, from whence their

ideas are taken, as from their original, are apt to be very confused. Justice is a word in every man's mouth, but most commonly with a very undertermined loose signification: which will always be so, unless a man has in his mind a distinct comprehension of the component parts that complex idea consists of; and if it be decomposed, must be able to resolve it still on, till he at last comes to the simple ideas, that make it up: and unless this be done, a man makes an ill use of the word, let it be justice, for example, or any other. I do not say, a man needs stand to recollect, and make this analysis at large, every time the word justice comes in his way: but this, at least, is necessary, that he have so examined the signification of that name, and settled the idea of all its parts in his mind, that he can do it when he pleases. If one, who makes his complex idea of justice, to be such a treatment of the person or goods of another, as is according to law, hath not a clear and distinct idea what law is, which makes a part of his complex idea of justice, 'tis plain, his idea of justice itself, will be confused and imperfect. This exactness will, perhaps, be judged very troublesome: and therefore most men will think, they may be excused from settling the complex ideas of mixed modes so precisely in their minds. But yet I must say, till this be done, it must not be wondered, that they have a great deal of obscurity and confusion in their own minds, and a great deal of wrangling in their discourse with others.

§10. And conformable in substances. In the names of substances, for a right use of them, something more is required than barely determined ideas: in these the names must also be conformable to things, as they exist: but of this, I shall have occasion to speak more at large by and by. This exactness is absolutely necessary in inquiries after philosophical knowledge, and in controversies about truth. And though it would be well too, if it extended itself to common conversation, and the ordinary affairs of life; yet I think that is scarce to be expected. Vulgar notions suit vulgar discourses: and both, though confused enough, yet serve pretty well the market, and the wake. Merchants and lovers, cooks and tailors, have words wherewithal to dispatch their ordinary affairs; and so, I think, might philosophers and disputants too, if they had a mind to understand, and to be clearly understood.

§11. Thirdly, propriety. Thirdly, 'tis not enough that men have ideas, determined ideas, for which they make these signs stand; but

they must also take care to apply their words, as near as may be, to such ideas as common use has annexed them to. For words, especially of languages already framed, being no man's private possession, but the common measure of commerce and communication, 'tis not for anyone at pleasure, to change the stamp they are current in; nor alter the ideas they are affixed to; or at least when there is a necessity to do so, he is bound to give notice of it. Men's intentions in speaking are, or at least should be, to be understood; which cannot be without frequent explanations, demands, and other the like incommodious interruptions, where men do not follow common use. Propriety of speech, is that which gives our thoughts entrance into other men's minds with the greatest ease and advantage: and therefore deserves some part of our care and study, especially in the names of moral words. The proper signification and use of terms is best to be learned from those, who in their writings and discourses, appear to have had the clearest notions, and applied to them their terms with the exactest choice and fitness. This way of using a man's words, according to the propriety of the language, though it have not always the good fortune to be understood: yet most commonly leaves the blame of it on him, who is so unskilful in the language he speaks, as not to understand it, when made use of, as it ought to be.

§12. Fourthly, to make known their meanin. Fourthly, but because common use has not so visibly annexed any signification to words, as to make men know always certainly what they precisely stand for: and because men in the improvement of their knowledge, come to have ideas different from the vulgar and ordinary received ones, for which they must either make new words, (which men seldom venture to do, for fear of being though guilty of affectation or novelty,) or else must use old ones, in a new signification. Therefore, after the observation of the foregoing rules, 'tis sometimes necessary for the ascertaining the signification of words, to declare their meaning; where either common use has left it uncertain and loose; (as it has in most names of very complex ideas) or where the term, being very material in the discourse, and that upon which it chiefly turns, is liable to any doubtfulness or mistake.

§13. And that three ways. As the ideas, men's words stand for, are of different sorts: so the way of making known the ideas, they stand for, when there is occasion, is also different. For though defining be thought the proper way, to make known the proper signification of

words; yet there be some words, that will not be defined, as there are others whose, precise meaning cannot be made known, but by definition: and, perhaps, a third, which partake somewhat of both the other, as we shall see in the names of simple ideas, modes, and substances.

§14. First, in simple ideas by synonymous terms or showing . First, when a man makes use of the name of any simple idea, which he perceives is not understood, or is in danger to be mistaken, he is obliged by the laws of ingenuity, and the end of speech, to declare his meaning, and make known what idea he makes it stand for. This, as has been shown, cannot be done by definition: and therefore, when a synonymous word fails to do it, there is but one of these ways left. First, sometimes the naming the subject, wherein that simple idea is to be found, will make its name to be understood by those, who are acquainted with that subject, and know it by that name. So to make a countryman understand what *feuille morte*¹ colour signifies, it may suffice to tell him, 'tis the colour of withered leaves falling in autumn. Secondly, but the only sure way of making known the signification of the name of any simple idea, is by presenting to his senses that subject, which may produce it in his mind, and make him actually have the idea, that word stands for.

§15. Secondly, in mixed modes by definition. Secondly, mixed modes, especially those belonging to morality, being most of them such combinations of ideas, as the mind puts together of its own choice; and whereof there are not always standing patterns to be found existing, the signification of their names cannot be made known, as those of simple ideas, by any showing: but in recompense thereof, may be perfectly and exactly defined. For they being combinations of several ideas, that the mind of man has arbitrarily put together, without reference to any archetypes, men may, if they please, exactly know the ideas, that go to each composition, and so both use these words in a certain and undoubted signification, and perfectly declare, when there is occasion, what they stand for. This, if well considered, would lay great blame on those, who make not their discourses about moral things very clear and distinct. For since the precise signification of the names of mixed modes, or which is all one, the real essence of each species, is to be known, they being not of nature's, but man's making, 'tis a great negligence and perverseness, to discourse of moral things with uncertainty and obscurity, which is

more pardonable in treating of natural substances, where doubtful terms are hardly to be avoided, for a quite contrary reason, as we shall see by and by.

§16. Morality capable of demonstration. Upon this ground 'tis, that I am bold to think, that morality is capable of demonstration, as well as mathematics: since the precise real essence of the things moral words stand for, may be perfectly known; and so the congruity, or incongruity of the things themselves, be certainly discovered, in which consists perfect knowledge. Nor let anyone object, that the names of substances are often to be made use of in morality, as well as those of modes, from which will arise obscurity. For as to substances, when concerned in moral discourses, their divers natures are not so much inquired into, as supposed; v.g. when we say that 'man is subject to law': we mean nothing by man, but a corporeal rational creature: what the real essence or other qualities of that creature are in this case, is no way considered. And, therefore, whether a child or changeling be a man in a physical sense, may amongst the naturalists be as disputable as it will, it concerns not at all the moral man, as I may call him, which is this immovable unchangeable idea, a corporeal rational being. For were there a monkey, or any other creature to be found, that had the use of reason, to such a degree, as to be able to understand general signs, and to deduce consequences about general ideas, he would no doubt be subject to law, and, in that sense, be a man, how much soever he differed in shape from others of that name. The names of substances, if they be used in them, as they should, can no more disturb moral, than they do mathematical discourses: where, if the mathematician speaks of a cube or globe of gold, or of any other body, he has his clear settled idea, which varies not, though it may, by mistake be applied to a particular body, to which it belongs not.

§17. Definitions can make moral discourses clear. This I have here mentioned by the by, to show of what consequence 'tis for men, in their names of mixed modes, and consequently, in all their moral discourses, to define their words when there is occasion: since thereby moral knowledge may be brought, to so great clearness and certainty. And it must be great want of ingenuity (to say no worse of it) to refuse to do it: since a definition is the only way, whereby the precise meaning of moral words can be known; and yet a way, whereby their meaning may be known certainly, and without leaving any room for

any contest about it. And therefore the negligence or perverseness of mankind, cannot be excused, if their discourses in morality be not much more clear, than those in natural philosophy: since they are about ideas in the mind, which are none of them false or disproportionate; they having no external beings for archetypes which they are referred to, and must correspond with. 'Tis far easier for men to frame in their minds an idea, which shall be the standard to which they will give the name justice, with which pattern so made, all actions that agree shall pass under that denomination, than, having seen Aristides, to frame an idea, that shall, in all things, be exactly like him, who is as he is, let men make what idea, they please of him. For the one, they need but know the combination of ideas, that are put together within in their own minds; for the other, they must inquire into the whole nature, and abstruse hidden constitution, and various qualities of a thing existing without them.

§18. And is the only way. Another reason that makes the defining of mixed modes so necessary, especially of moral words, is what I mentioned a little before, viz. that 'tis the only way whereby the signification of the most of them can be known with certainty. For the ideas they stand for, being for the most part such, whose component parts nowhere exist together, but scattered and mingled with others, 'tis the mind alone that collects them, and gives them the union of one idea: and 'tis only by words, enumerating the several simple ideas which the mind has united, that we can make known to others, what their names stand for; the assistance of the senses in this case not helping us, by the proposal of sensible objects, to show the ideas, which our names of this kind stand for, as it does often in the names of sensible simple ideas, and also to some degree in those of substances.

§19. Thirdly, in substances, by showing and defining. Thirdly, for the explaining the signification of the names of substances as they stand for the ideas we have of their distinct species, both the forementioned ways, viz. of showing and defining, are requisite, in many cases, to be made use of. For there being ordinarily in each sort some leading qualities, to which we suppose the other ideas, which make up our complex idea of that species, annexed, we forwardly give the specific name to that thing, wherein that characteristical mark is found, which we take to be the most distinguishing idea of that species. These leading or characteristical (as I may call them) ideas, in

the sorts of animals and vegetables, is (as has been before remarked, Ch. VI. §29, and Ch. IX. §15) mostly figure, and in inanimate bodies colour, and in some both together. Now, §20. Ideas of the leading qualities of substances, are best got by showing. These leading sensible qualities are those, which make the chief ingredients of our specific ideas, and consequently the most observable and invariable part in the definitions of our specific names, as attributed to sorts of substances coming under our knowledge. For though the sound man, in its own nature, be as apt to signify a complex idea made up of animality and rationality, united in the same subject, as to signify any other combination; yet, used as a mark to stand for a sort of creatures we count of our own kind, perhaps the outward shape is as necessary to be taken into our complex idea, signified by the word man, as any other we find in it, and therefore why Plato's animal implume bipes latis unguibus, should not be as good a definition of the name man, standing for that sort of creatures, will not be easy to show: for 'tis the shape, as the leading quality, that seems more to determine that species, than a faculty of reasoning, which appears not at first, and in some never. And if this be not allowed to be so, I do not know how they can be excused from murder, who kill monstrous births, (as we call them,) because of an unordinary shape, without knowing whether they have a rational soul, or no; which can be no more discerned in a well-formed, than ill-shaped infant, as soon as born. And who is it has informed us, that a rational soul can inhabit no tenement, unless it has just such a sort of frontispiece, or can join itself to, and inform no sort of body, but one that is just of such an outward structure.

§21. Now these leading qualities, are best made known by showing and can hardly be made known otherwise. For the shape of an horse, or cassowary, will be but rudely and imperfectly imprinted on the mind by words, the sight of the animals doth it a thousand times better: and the idea of the particular colour of gold, is not to be got by any description of it, but only by the frequent exercise of the eyes about it, as is evident; in those who are used to this metal, who will frequently distinguish true from counterfeit, pure from adulterate, by the sight, where others (who have as good eyes, but yet by use, have not got the precise nice idea of that peculiar yellow) shall not perceive any difference. The like may be said of those other simple ideas, peculiar in their kind to any substance; for which precise ideas, there are no peculiar names. The particular ringing sound there is in gold, distinct from the sound of other bodies, has no particular

name annexed to it, no more than the particular yellow, that belongs to that metal.

§22. The ideas of their powers best by definition. But because many of the simple ideas that make up our specific ideas of substances are powers, which lie not obvious to our senses in the things as they ordinarily appear; therefore, in the signification of our names of substances, some part of the signification will be better made known by enumerating those simple ideas, than by showing the substance itself. For, he that, to the yellow shining colour of gold got by sight, shall, from my enumerating them, have the ideas of great ductility, fusibility, fixedness, and solubility, in aqua regia, will have a perfecter idea of gold, than he can have by seeing a piece of gold, and thereby imprinting in his mind only its obvious qualities. But if the formal constitution of this shining, heavy, ductile thing (from whence all these its properties flow) lay open to our senses, as the formal constitution, or essence of a triangle does, the signification of the word gold, might as easily be ascertained, as that of triangle.

§23. A reflection on the knowledge of spirits. Hence we may take notice, how much the foundation of all our knowledge of corporeal things, lies in our senses. For how spirits, separate from bodies, (whose knowledge and ideas of these things, is certainly much more perfect than ours) know them, we have no notion, no idea at all. The whole extent of our knowledge, or imagination reaches not beyond our own ideas, limited to our ways of perception. Though yet it be not to be doubted, that spirits of a higher rank than those immersed in flesh, may have as clear ideas of the radical constitution of substances, as we have of a triangle, and so perceive how all their properties and operations flow from thence: but the manner how they come by that knowledge, exceeds our conceptions.

§24. Ideas also of substances must be conformable to things. But though definitions will serve to explain the names of substances, as they stand for our ideas; yet they leave them not without great imperfection, as they stand for things. For our names of substances being not put barely for our ideas, but being made use of ultimately to represent things, and so are put in their place, their signification must agree with the truth of things, as well as with men's ideas. And therefore in substances, we are not always to rest in the ordinary complex idea, commonly received as the signification of that word,

but must go a little further, and inquire into the nature and properties of the things themselves, and thereby perfect, as much as we can, our ideas of their distinct species; or else learn them from such as are used to that sort of things, and are experienced in them. For, since 'tis intended their names should stand for such collections of simple ideas, as do really exist in things themselves, as well as for the complex idea in other men's minds, which in their ordinary acceptation they stand for: therefore to define their names right, natural history is to be inquired into; and their properties are, with care and examination, to be found out. For 'tis not enough, for the avoiding inconveniences in discourse and arguings about natural bodies and substantial things, to have learned, from the propriety of the language, the common but confused, or very imperfect idea, to which each word is applied, and to keep them to that idea in our use of them: but we must, by acquainting ourselves with the history of that sort of things rectify and settle our complex idea, belonging to each specific name; and in discourse with others, (if we find them mistake us) we ought to tell, what the complex idea is, that we make such a name stand for. This is the more necessary to be done by all those, who search after knowledge, and philosophical verity, in that children being taught words whilst they have but imperfect notions of things, apply them at random, and without much thinking, and seldom frame determined ideas to be signified by them. Which custom, (it being easy, and serving well enough for the ordinary affairs of life and conversation) they are apt to continue, when they are men: and so begin at the wrong end, learning words first, and perfectly, but make the notions to which they apply those words afterwards, very overtly. By this means it comes to pass, that men speaking the proper language of their country, i.e. according to grammar-rules of that language, do yet speak very improperly of things themselves; and by their arguing one with another, make but small progress in the discoveries of useful truths, and the knowledge of things, as they are to be found in themselves, and not in our imaginations; and it matters not much, for the improvement of our knowledge, how they are called.

§25. Not easy to be made so. It were therefore to be wished, that men versed in physical inquiries, and acquainted with the several sorts of natural bodies, would set down those simple ideas, wherein they observe the individuals of each sort constantly to agree. This would remedy a great deal of that confusion, which comes from several persons, applying the same name to a collection of a smaller, or greater

number of sensible qualities, proportionably as they have been more or less acquainted with, or accurate in examining the qualities of any sort of things, which come under one denomination. But a dictionary of this sort, containing, as it were, a natural history, requires too many hands, as well as too much time, cost, pains, and sagacity, ever to be hoped for; and till that be done, we must content ourselves with such definitions of the names of substances, as explain the sense men use them in. And 'twould be well, where there is occasion, if they would afford us so much. This yet is not usually done; but men talk to one another, and dispute in words, whose meaning is not agreed between them, out of a mistake, that the significations of common words, are certainly established, and the precise ideas, they stand for, perfectly known; and that 'tis a shame to be ignorant of them. Both which suppositions are false: no names of complex ideas having so settled determined significations, that they are constantly used for the same precise ideas. Nor is it a shame for a man not to have a certain knowledge of anything, but by the necessary ways of attaining it; and so 'tis no discredit not to know, what precise idea any sound stands for in another man's mind, without he declare it to me, by some other way than barely using that sound, there being no other way, without such a declaration, certainly to know it. Indeed, the necessity of communication by language, brings men to an agreement in the signification of common words, within some tolerable latitude, that may serve for ordinary conversation: and so a man cannot be supposed wholly ignorant of the ideas, which are annexed to words by common use, in a language familiar to him. But common use, being but a very uncertain rule, which reduces itself at last to the ideas of particular men, proves often but a very variable standard. But though such a Dictionary, as I have above-mentioned, will require too much time, cost and pains, to be hoped for in this age; yet, methinks, 'tis not unreasonable to propose, that words standing for things, which are known and distinguished by their outward shapes, should be expressed by little draughts and prints made of them. A vocabulary made after this fashion, would, perhaps with more ease, and in less time, teach the true signification of many terms, especially in languages of remote countries or ages, and settle truer ideas in men's minds of several things, whereof we read the names in ancient authors, than all the large and laborious comments of learned critics. Naturalists, that treat of plants and animals, have found the benefit of this way: and he that has had occasion to consult them, will have reason to confess, that he has a clear idea of apium, or ibex, from a

little print of that herb, or beast, than he could have from a long definition of the names of either of them. And so, no doubt, he would have of strigil and sistrum, if instead of curry-comb, and cymbal, (which are the English names dictionaries render them by,) he could see stamped in the margin, small pictures of these instruments, as they were in use amongst the ancients. Toga, tunica, pallium, are words easily translated by gown, coat, and cloak: but we have thereby no more true ideas of the fashion of those habits amongst the Romans, than we have of the faces of the tailors who made them. Such things as these, which the eye distinguishes by their shapes, would be best let into the mind by draughts made of them, and more determine the signification of such words, than any other words set for them, or made use of to define them. But this only by the bye.

§26. Fifthly, by constantly in their signification. Fifthly, if men will not be at the pains to declare the meaning of their words, and definitions of their terms are not to be had; yet this is the least can be expected, that in all discourses, wherein one man pretends to instruct or convince another, he should use the same word constantly in the same sense: If this were done, (which nobody can refuse, without great disingenuity) many of the books extant might be spared; many of the controversies in dispute would be at an end; several of those great volumes, swollen with ambiguous words, now used in one sense, and by and by in another, would shrink into a very narrow compass; and many of the philosophers' (to mention no other,) as well as poets' works, might be contained in a nutshell.

§27. When the variation is to be explained. But after all, the provision of words is so scanty in respect to that infinite variety of thoughts, that men, wanting terms to suit their precise notions, will, notwithstanding their utmost caution, be forced often to use the same word, in somewhat different senses. And though in the continuation of a discourse, or the pursuit of an argument, there be hardly room to digress into a particular definition, as often as a man varies the signification of any term; yet the import of the discourse will, for the most part, if there be no designed fallacy, sufficiently lead candid and intelligent readers, into the true meaning of it: but where there is not sufficient to guide the reader, there it concerns the writer to explain his meaning, and show in what sense he there uses that term.

BOOK IV:Of Knowledge and Opinion

Chapter I Of Knowledge in General

§1. Our knowledge conversant about our ideas. Since the mind, in all its thoughts and reasonings, hath no other immediate object but its own ideas, which it alone does or can contemplate, 'tis evident, that our knowledge is only conversant about them.

§2. Knowledge is the perception of the agreement or disagreement of two ideas. Knowledge then seems to me to be nothing but the perception of the connexion and agreement, or disagreement and repugnancy of any of our ideas. In this alone it consists. Where this perception is, there is knowledge, and where 'tis not, there, though we may fancy, guess, or believe, yet we always come short of knowledge. For when we know that 'white is not black', what do we else but perceive, that these two ideas do not agree? When we possess ourselves with the utmost security of the demonstration, that 'the three angles of a triangle are equal to two right ones', what do we more but perceive, that equality to two right ones, does necessarily agree to, and is inseparable from the three angles of a triangle?

§3. This agreement fourfold. But to understand a little more distinctly, wherein this agreement or disagreement consists, I think we may reduce it all to these four sorts:

I. Identity, or diversity.

II. Relation.

III. Co-existence, or necessary connexion.

IV. Real existence.

§4. First, of identity or diversity. First, as to the first sort of agreement or disagreement, viz. identity, or diversity. 'Tis the first act of the mind, when it has any sentiments or ideas at all, to perceive its ideas, and so far as it perceives them, to know each what it is, and thereby also to perceive their difference, and that one is not another. This is so absolutely necessary, that without it there could be

no knowledge, no reasoning, no imagination, no distinct thoughts at all. By this the mind clearly and infallibly perceives each idea to agree with itself, and to be what it is; and all distinct ideas to disagree, i.e. the one not to be the other: and this it does without pains, labour, or deduction; but at first view, by its natural power of perception and distinction. And though men of art have reduced this into those general rules, 'What is, is'; and ' 'Tis impossible for the same thing to be, and not to be', for ready application in all cases, wherein there may be occasion to reflect on it; yet 'tis certain, that the first exercise of this faculty, is about particular ideas. A man infallibly knows, as soon as ever he has them in his mind that the ideas he calls white and round, are the very ideas they are, and that they are not other ideas which he calls red or square. Nor can any maxim or proposition in the world make him know it clearer or surer than he did before, and without any such general rule. This then is the first agreement or disagreement, which the mind perceives in its ideas; which it always perceives at first sight: and if there ever happen any doubt about it, 'twill always be found to be about the names, and not the ideas themselves, whose identity and diversity will always be perceived, as soon and as clearly as the ideas themselves are, nor can it possibly be otherwise.

§5. Secondly, relative. Secondly, the next sort of agreement, or disagreement, the mind perceives in any of its ideas, may, I think, be called relative, and is nothing but the perception of the relation between any two ideas, of what kind soever, whether substances, modes, or any other. For, since all distinct ideas must eternally be known not to be the same, and so be universally and constantly denied one of another, there could be no room for any positive knowledge at all, if we could not perceive any relation between our ideas, and find out the agreement or disagreement, they have one with another, in several ways the mind takes of comparing them.

§6. Thirdly, of co-existence. Thirdly, the third sort of agreement, or disagreement to be found in our ideas, which the perception of the mind is employed about, is co-existence, or non-co-existence in the same subject; and this belongs particularly to substances. Thus when we pronounce concerning gold, that 'tis fixed, our knowledge of this truth amounts to no more but this, that fixedness, or a power to remain in the fire unconsumed, is an idea, that always accompanies, and is joined with that particular sort of

yellowness, weight, fusibility, malleableness, and solubility in aqua regia, which make our complex idea, signified by the word gold.

§7. Fourthly, of real existence. Fourthly, the fourth and last sort is, that of actual real existence agreeing to any idea. Within these four sorts of agreement or disagreement is, I suppose contained all the knowledge we have, or are capable of: for all the inquiries that we can make, concerning any of our ideas, all that we know or can affirm concerning any of them, is, that it is, or is not the same with some other; that it does or does not always co-exist with some other idea in the same subject; that it has this or that relation to some other idea; or that it has a real existence without the mind. Thus, 'blue is not yellow,' is of identity. 'Two triangles upon equal bases, between two parallels are equal,' is of relation. 'Iron is susceptible of magnetical impressions,' is of co-existence. 'God is,' is of real existence. Though identity and co-existence are truly nothing but relations, yet they are so peculiar ways of agreement, or disagreement of our ideas, that they deserve well to be considered as distinct heads, and not under relation in general; since they are so different grounds of affirmation and negation, as will easily appear to any one, who will but reflect on what is said in several places of this essay. I should now proceed to examine the several degrees of our knowledge, but that 'tis necessary first to consider the different acceptations of the word knowledge.

§8. Knowledge actual or habitual. There are several ways wherein the mind is possessed of truth; each of which is called knowledge.

1. There is actual knowledge, which is the present view the mind has of the agreement, or disagreement of any of its ideas, or of the relation they have one to another.

2. A man is said to know any proposition, which having been once laid before his thoughts, he evidently perceived the agreement, or disagreement of the ideas whereof it consists; and so lodged it in his memory, that whenever that proposition comes again to be reflected on, he, without doubt or hesitation, embraces the right side, assents to, and is certain of the truth of it. This, I think, one may call habitual knowledge: and thus a man may be said to know all those truths, which are lodged in his memory, by a foregoing clear and full perception, whereof the mind is assured past doubt, as often as it has occasion to reflect on them. For our finite understandings being able to think, clearly and distinctly, but on one thing at once, if men had

no knowledge of any more than what they actually thought on, they would all be very ignorant: and he that knew most, would know but one truth, that being all he was able to think on at one time.

§9. Habitual knowledge two-fold. Of habitual knowledge there are also, vulgarly speaking, two degrees: First, the one is of such truths laid up in the memory, as whenever they occur to the mind, it actually perceives the relation is between those ideas. And this is in all those truths, whereof we have an intuitive knowledge, where the ideas themselves, by an immediate view, discover their agreement or disagreement one with another.

Secondly, the other is of such truths, whereof the mind having been convinced, it retains the memory of the conviction, without the proofs. Thus a man that remembers certainly, that he once perceived the demonstration, that the three angles of a triangle are equal to two right ones, is certain that he knows it, because he cannot doubt of the truth of it. In his adherence to a truth, where the demonstration, by which it was at first known, is forgot, though a man may be thought rather to believe his memory, than really to know, and this way of entertaining a truth seemed formerly to me like something between opinion and knowledge, a sort of assurance which exceeds bare belief, for that relies on the testimony of another; yet upon a due examination I find it comes not short of perfect certainty, and is in effect true knowledge. That which is apt to mislead our first thoughts into a mistake in this matter is, that the agreement or disagreement of the ideas in this case is not perceived, as it was at first, by an actual view of all the intermediate ideas, whereby the agreement or disagreement of those in the proposition was at first perceived; but by other intermediate ideas, that show the agreement or disagreement of the ideas contained in the proposition whose certainty we remember. For example: in this proposition, that the three angles of a triangle are equal to two right ones, one, who has seen and clearly perceived the demonstration of this truth, knows it to be true, when that demonstration is gone out of his mind; so that at present 'tis not actually in view, and possibly cannot be recollected: but he knows it in a different way, from what he did before. The agreement of the two ideas joined in that proposition is perceived, but 'tis by the intervention of other ideas than those which at first produced that perception. He remembers, i.e. he knows (for remembrance is but the reviving of some past knowledge) that he was once certain of the truth

of this proposition, that the three angles of a triangle are equal to two right ones. The immutability of the same relations between the same immutable things, is now the idea that shows him, that if the three angles of a triangle were once equal to two right ones, they will always be equal to two right ones. And hence he comes to be certain, that what was once true in the case is always true; what ideas once agreed will always agree; and consequently what he once knew to be true he will always know to be true, as long as he can remember that he once knew it. Upon this ground it is, that particular demonstrations in mathematics afford general knowledge. If then the perception that the same ideas will eternally have the same habitudes and relations be not a sufficient ground of knowledge, there could be no knowledge of general propositions in mathematics, for no mathematical demonstration would be any other than particular: and when a man had demonstrated any proposition concerning one triangle or circle, his knowledge would not reach beyond that particular diagram. If he would extend it further, he must renew his demonstration in another instance, before he could know it to be true in another like triangle, and so on: by which means one could never come to the knowledge of any general propositions. Nobody, I think, can deny that Mr Newton certainly knows any proposition, that he now at any time reads in his book, to be true, though he has not in actual view that admirable chain of intermediate ideas, whereby he at first discovered it to be true. Such a memory as that, able to retain such a train of particulars, may be well thought beyond the reach of human faculties. When the very discovery, perception, and laying together that wonderful connexion of ideas is found to surpass most readers' comprehension. But yet 'tis evident, the author himself knows the proposition to be true, remembering he once saw the connexion of those ideas, as certainly as he knows such a man wounded another, remembering that he saw him run him through. But because the memory is not always so clear as actual perception, and does in all men more or less decay in length of time, this, amongst other differences is one, which shows, that demonstrative knowledge, is much more imperfect than intuitive, as we shall see in the following chapter.

Chapter II Of the Degrees of our Knowledge

§1. Intuitive. All our knowledge consisting, as I have said, in the view the mind has of its own ideas, which is the utmost light and

greatest certainty, we with our faculties, and in our way of knowledge are capable of, it may not be amiss, to consider a little the degrees of its evidence. The different clearness of our knowledge seems to me to lie in the different way of perception, the mind has of the agreement, or disagreement of any of its ideas. For if we will reflect on our own ways of thinking, we will find, that sometimes the mind perceives the agreement or disagreement of two ideas immediately by themselves, without the intervention of any other: and this, I think, we may call intuitive knowledge. For in this, the mind is at no pains of proving or examining, but perceives the truth, as the eye doth light, only by being directed toward it. Thus the mind perceives, that white is not black, that a circle is not a triangle, that three are more than two, and equal to one and two. Such kinds of truths, the mind perceives at the first sight of the ideas together, by bare intuition, without the intervention of any other idea; and this kind of knowledge is the clearest, and most certain, that human frailty is capable of. This part of knowledge is irresistible, and like bright Sunshine, forces itself immediately to be perceived, as soon as ever the mind turns its view that way; and leaves no room for hesitation, doubt, or examination, but the mind is presently filled with the clear light of it. 'Tis on this intuition, that depends all the certainty and evidence of all our knowledge, which certainty everyone finds to be so great, that he cannot imagine, and therefore not require a greater: for a man cannot conceive himself capable of a greater certainty, than to know that any idea in his mind is such, as he perceives it to be; and that two ideas, wherein he perceives a difference, are different, and not precisely the same. He that demands a greater certainty than this, demands he knows not what, and shows only that he has a mind to be a sceptic, without being able to be so. Certainty depends so wholly on this intuition, that, in the next degree of knowledge, which I call demonstrative, this intuition is necessary in all the connexions of the intermediate ideas, without which we cannot attain knowledge and certainty.

§2. Demonstrative. The next degree of knowledge is, where the mind perceives the agreement or disagreement of any ideas, but not immediately. Though wherever the mind perceives the agreement or disagreement of any of its ideas, there be certain knowledge; yet it does not always happen, that the mind sees that agreement or disagreement, which there is between them, even where 'tis discoverable; and in that case, remains in ignorance, and at most, gets no further than a probable conjecture. The reason why the mind

cannot always perceive presently the agreement or disagreement of two ideas is, because those ideas, concerning whose agreement or disagreement the inquiry is made, cannot by the mind be so put together, as to show it. In this case then, when the mind cannot so bring its ideas together, as by their immediate comparison, and as it were juxtaposition, or application one to another, to perceive their agreement or disagreement, 'tis fain, by the intervention of other ideas (one or more, as it happens) to discover the agreement or disagreement, which it searches; and this is that which we call reasoning. Thus the mind being willing to know the agreement or disagreement in bigness, between the three angles of a triangle, and two right ones, cannot by an immediate view and comparing them, do it: because the three angles of a triangle cannot be brought at once, and be compared with any one, or two angles; and so of this the mind has no immediate, no intuitive knowledge. In this case the mind is fain to find out some other angles, to which the three angles of a triangle have an equality; and finding those equal to two right ones, comes to know their equality to two right ones.

§3. Depends on proofs. Those intervening ideas, which serve to show the agreement of any two others, are called proofs; and where the agreement or disagreement is by this means plainly and clearly perceived, 'tis called demonstration, it being shown to the understanding, and the mind made see that 'tis so. A quickness in the mind to find out these intermediate ideas, (that shall discover the agreement or disagreement of any other,) and to apply them right, is, I suppose, that which is called sagacity.

§4. But not so easy. This knowledge by intervening proofs, though it be certain, yet the evidence of 'tis not altogether so clear and bright, nor the assent so ready, as in intuitive knowledge. For though in demonstration, the mind does at last perceive the agreement or disagreement of the ideas it considers; yet 'tis not without pains and attention: there must be more than one transient view to find it. A steady application and pursuit is required to this discovery: and there must be a progression by steps and degrees, before the mind can in this way arrive at certainty, and come to perceive the agreement or repugnancy between two ideas that need proofs and the use of reason to show it.

§5. Not without precedent doubt. Another difference between

intuitive and demonstrative knowledge, is, that though in the latter all doubt be removed, when by the intervention of the intermediate ideas, the agreement or disagreement is perceived; yet before the demonstration there was a doubt, which in intuitive knowledge cannot happen to the mind that has its faculty of perception left to a degree capable of distinct ideas, no more than it can be a doubt to the eye, (that can distinctly see white and black,) Whether this ink, and this paper be all of a colour. If there be sight in the eyes, it will at first glimpse, without hesitation, perceive the words printed on this paper, different from the colour of the paper: and so if the mind have the faculty of distinct perception, it will perceive the agreement or disagreement of those ideas that produce intuitive knowledge. If the eyes have lost the faculty of seeing, or the mind of perceiving, we in vain inquire after the quickness of sight in one, or clearness of perception in the other.

§6. Not so clear. 'Tis true, the perception produced by demonstration, is also very clear; yet 'tis often with a great abatement of that evident lustre and full assurance, that always accompany that which I call intuitive, like a face reflected by several mirrors one to another, where as long as it retains the similitude and agreement with the object, it produces a knowledge; but 'tis still in every successive reflection with a lessening of that perfect clearness and distinctness, which is in the first, till at last, after many removes, it has a great mixture of dimness, and is not at first sight so knowable, especially to weak eyes. Thus 'tis with knowledge, made out by a long train of proof.

§7. Each step must have intuitive evidence. Now, in every step reason makes in demonstrative knowledge, there is an intuitive knowledge of that agreement or disagreement, it seeks with the next intermediate idea, which it uses as a proof: for if it were not so, that yet would need a proof. Since without the perception of such agreement or disagreement, there is no knowledge produced: if it be perceived by itself, 'tis intuitive knowledge: if it cannot be perceived by itself, there is need of some intervening idea, as a common measure to show their agreement or disagreement. By which 'tis plain, that every step in reasoning, that produces knowledge, has intuitive certainty; which when the mind perceives, there is no more required, but to remember it to make the agreement or disagreement of the ideas, concerning which we inquire, visible and certain. So that to

make anything a demonstration, 'tis necessary to perceive the immediate agreement of the intervening ideas, whereby the agreement or disagreement of the two ideas under examination (whereof the one is always the first, and the other the last in the account) is found. This intuitive perception of the agreement or disagreement of the intermediate ideas, in each step and progression of the demonstration, must also be carried exactly in the mind, and a man must be sure that no part is left out which because in long deductions, and the use of many proofs, the memory does not always so readily and exactly retain: therefore it comes to pass, that this is more imperfect than intuitive knowledge, and men embrace often falsehood for demonstrations.

§8. Hence the mistake, *ex praecognitis, et praeconcessis*. The necessity of this intuitive knowledge, in each step of scientific or demonstrative reasoning, gave occasion, I imagine, to that mistaken axiom, that all reasoning was *ex praecognitis et praeconcessis*; which how far 'tis a mistake, I shall have occasion to show more at large, when I come to consider propositions, and particularly those propositions, which are called maxims, and to show that 'tis by a mistake, that they are supposed to be the foundations of all our knowledge and reasonings.

§9. Demonstration not limited to quantity. It has been generally taken for granted, that mathematics alone are capable of demonstrative certainty: but to have such an agreement or disagreement, as may intuitively be perceived, being, as I imagine, not the privilege of the ideas of number, extension, and figure alone, it may possibly be the want of due method, and application in us, and not of sufficient evidence in things, that demonstration has been thought to have so little to do in other parts of knowledge, and been scarce so much as aimed at by any but mathematicians. For whatever ideas we have, wherein the mind can perceive the immediate agreement or disagreement that is between them, there the mind is capable of intuitive knowledge; and where it can perceive the agreement or disagreement of any two ideas, by an intuitive perception of the agreement or disagreement they have with any intermediate ideas, there the mind is capable of demonstration, which is not limited to ideas of extension, figure, number, and their modes.

§10. Why it has been so thought. The reason why it has been

generally sought for, and supposed to be only in those, I imagine, has been, not only the general usefulness of those sciences, but because, in comparing their equality or excess, the modes of numbers have every the least difference very clear and perceivable: and though in extension, every the least excess is not so perceptible; yet the mind has found out ways, to examine and discover demonstratively the just equality of two angles, or extensions, or figures, and both these, i.e. numbers and figures, can be set down, by visible and lasting marks, wherein the ideas under consideration are perfectly determined, which for the most part they are not, where they are marked only by names and words.

§11. But in other simple ideas, whose modes and differences are made, and counted by degrees, and not quantity, we have not so nice and accurate a distinction of their differences, as to perceive, or find ways to measure their just equality or the least differences. For those other simple ideas, being appearances of sensations, produced in us, by the size, figure, number, and motion of minute corpuscles singly insensible, their different degrees also depend upon the variation of some, or of all those causes; which since it cannot be observed by us in particles of matter, whereof each is too subtile to be perceived, 'tis impossible for us to have any exact measures of the different degrees of these simple ideas. For supposing the sensation or idea we name whiteness, be produced in us by a certain number of globules, which having a verticity about their own centres, strike upon the retina of the eye, with a certain degree of rotation, as well as progressive swiftness; it will hence easily follow, that the more the superficial parts of any body are so ordered, as to reflect the greater number of globules of light, and to give them the proper rotation, which is fit to produce this sensation of white in us, the more white will that body appear, that, from an equal space sends to the retina the greater number of such corpuscles, with that peculiar sort of motion. I do not say, that the nature of light consists in very small round globules, nor of whiteness, in such a texture of parts as gives a certain rotation to these globules, when it reflects them; for I am not now treating physically of light or colours: but this, I think I may say, that I cannot (and I would be glad anyone would make intelligible that he did) conceive how bodies without us, can any ways affect our senses, but by the immediate contact of the sensible bodies themselves, as in tasting and feeling, or the impulse of some insensible particles coming from them, as in seeing, hearing, and smelling; by the different impulse of

which parts, caused by their different size, figure, and motion, the variety of sensations is produced in us.

§12. Whether then they be globules, or no; or whether they have a verticity about their own centres, that produces the idea of whiteness in us, this is certain, that the more particles of light are reflected from a body, fitted to give them that peculiar motion, which produces the sensation of whiteness in us; and possibly too, the quicker that peculiar motion is, the whiter does the body appear, from which the greatest number are reflected, as is evident in the same piece of paper put in the sun-beams, in the shade, and in a dark hole; in each of which, it will produce in us the idea of whiteness in far different degrees.

§13. The secondary qualities of things not discovered by demonstration. Not knowing therefore what number of particles, nor what motion of them is fit to produce any precise degree of whiteness, we cannot demonstrate the certain equality of any two degrees of whiteness, because we have no certain standard to measure them by, nor means to distinguish every the least real difference, the only help we have being from our senses, which in this point fail us. But where the difference is so great, as to produce in the mind clearly distinct ideas, whose differences can be perfectly retained, there these ideas or colours, as we see in different kinds, as blue and red, are as capable of demonstration, as ideas of number and extension. What I have here said of whiteness and colours, I think holds true in all secondary qualities, and their modes.

§14. Sensitive knowledge of particular existence. These two, viz. intuition and demonstration, are the degrees of our knowledge; whatever comes short of one of these, with what assurance soever embraced, is but faith, or opinion, but not knowledge, at least in all general truths. There is, indeed, another perception of the mind, employed about the particular existence of finite beings without us; which going beyond bare probability, and yet not reaching perfectly to either of the foregoing degrees of certainty, passes under the name of knowledge. There can be nothing more certain, than that the idea we receive from an external object is in our minds; this is intuitive knowledge. But whether there be anything more than barely that idea in our minds, whether we can thence certainly infer the existence of anything without us, which corresponds to that idea, is

that, whereof some men think there may be a question made, because men may have such ideas in their minds, when no such thing exists, no such object affects their senses. But yet here, I think, we are provided with an evidence, that puts us past doubting: for I ask anyone, whether he be not invincibly conscious to himself of a different perception, when he looks on the sun by day, and thinks on it by night; when he actually tastes wormwood, or smells a rose, or only thinks on that savour, or odour? We as plainly find the difference there is between any idea revived in our minds by our own memory, and actually coming into our minds by our senses, as we do between any two distinct ideas. If anyone say, a dream may do the same thing, and all these ideas may be produced in us without any external objects, he may please to dream that I make him this answer, 1. That 'tis no great matter, whether I remove his scruple, or no: where all is but dream, reasoning and arguments are of no use, truth and knowledge nothing. 2. That I believe he will allow a very manifest difference between dreaming of being in the fire, and being actually in it. But yet if he be resolved to appear so sceptical, as to maintain, that what I call being actually in the fire, is nothing but a dream; and that we cannot thereby certainly know, that any such thing as fire actually exists without us: I answer, that we certainly find that pleasure or pain follows upon the application of certain objects to us, whose existence we perceive, or dream that we perceive, by our senses; this certainty is as great as our happiness, or misery, beyond which, we have no concernment to know, or to be. So that, I think, we may add to the two former sorts of knowledge, this also, of the existence of particular external objects, by that perception and consciousness we have of the actual entrance of ideas from them, and allow these three degrees of knowledge, viz. intuitive, demonstrative, and sensitive: in each of which, there are different degrees and ways of evidence and certainty.

§15. Knowledge not always clear, where the ideas are so. But since our knowledge is founded on, and employed about our ideas only, will it not follow from thence, that 'tis conformable to our ideas; and that where our ideas are clear and distinct or obscure and confused, our knowledge will be so too? To which I answer, No: for our knowledge consisting in the perception of the agreement or disagreement of any two ideas, its clearness or obscurity, consists in the clearness or obscurity of that perception, and not in the clearness or obscurity of the ideas themselves: v.g. a man that has as clear ideas

of the angles of a triangle, and of equality to two right ones, as any mathematician in the world, may yet have but a very obscure perception of their agreement, and so have but a very obscure knowledge of it. But ideas, which by reason of their obscurity or otherwise, are confused, cannot produce any clear or distinct knowledge; because as far as any ideas are confused, so far the mind cannot perceive clearly, whether they agree or disagree. Or to express the same thing in a way less apt to be misunderstood. He that hath not determined the ideas to the words he uses, cannot make propositions of them, of whose truth he can be certain.

Chapter III Of the Extent of Human Knowledge

§1. First, no further than we have ideas. Knowledge, as has been said, lying in the perception of the agreement, or disagreement, of any of our ideas, it follows from hence, that, First, we can have knowledge no further than we have ideas.

§2. Secondly, no further than we can perceive their agreement or disagreement. Secondly, That we can have no knowledge further, than we can have perception of that agreement, or disagreement: Which perception being, 1. either by intuition, or the immediate comparing any two ideas; or, 2. by reason, examining the agreement, or disagreement of two ideas, by the intervention of some others, or, 3. by sensation, perceiving the existence of particular things. Hence it also follows,

§3. Thirdly, intuitive knowledge extends itself not to all the relations of all our ideas. Thirdly, That we cannot have an intuitive knowledge, that shall extend itself to all our ideas, and all that we would know about them; because we cannot examine and perceive all the relations they have one to another by juxtaposition, or an immediate comparison one with another. Thus having the ideas of an obtuse, and an acute angled triangle, both drawn from equal bases, and between parallels, I can, by intuitive knowledge, perceive the one not to be the other, but cannot that way know, whether they be equal or no; because their agreement, or disagreement in equality, can never be perceived by an immediate comparing them: the difference of figure makes their parts incapable of an exact immediate application; and therefore there is need of some intervening qualities to measure them by, which is demonstration, or rational knowledge.

§4. Fourthly, nor demonstrative knowledge. Fourthly, it follows also, from what is above observed, that our rational knowledge, cannot reach to the whole extent of our ideas. Because between two different ideas we would examine, we cannot always find such mediums, as we can connect one to another with an intuitive knowledge, in all the parts of the deduction; and wherever that fails, we come short of knowledge and demonstration.

§5. Fifthly, sensitive knowledge narrower than either. Fifthly, sensitive knowledge reaching no further than the existence of things actually present to our senses, is yet much narrower than either of the former.

§6. Sixthly, our knowledge therefore narrower than our ideas. From all which 'tis evident, that the extent of our knowledge comes not only short of the reality of things, but even of the extent of our own ideas. Though our knowledge be limited to our ideas, and cannot exceed them either in extent or perfection; and though these be very narrow bounds, in respect of the extent of all being, and far short of what we may justly imagine to be in some even created understandings, not tied down to the dull and narrow information, that is to be received from some few, and not very acute ways of perception, such as are our senses; yet it would be well with us if our knowledge were but as large as our ideas, and there were not many doubts and inquiries concerning the ideas we have, whereof we are not, nor I believe ever shall be in this world, resolved. Nevertheless, I do not question, but that human knowledge, under the present circumstances of our beings and constitutions may be carried much further, than it hitherto has been, if men would sincerely, and with freedom of mind, employ all that industry and labour of thought, in improving the means of discovering truth, which they do for the colouring or support of falsehood, to maintain a system, interest, or party, they are once engaged in. But yet after all, I think I may, without injury to human perfection, be confident, that our knowledge would never reach to all we might desire to know concerning those ideas we have; nor be able to surmount all the difficulties, and resolve all the questions might arise concerning any of them. We have the ideas of a square, a circle, and equality; and yet, perhaps, shall never be able to find a circle equal to a square, and certainly know that 'tis so. We have the ideas of matter and thinking, but possibly shall never be able to know whether any mere material being thinks, or no; it

being impossible for us, by the contemplation of our own ideas, without revelation, to discover whether Omnipotency has not given to some systems of matter fitly disposed, a power to perceive and think, or else joined and fixed to matter so disposed, a thinking immaterial substance: it being, in respect of our notions, not much more remote from our comprehension to conceive, that God can, if he pleases,superadd to matter a faculty of thinking, than that he should superadd to it another substance, with a faculty of thinking; since we know not wherein thinking consists, nor to what sort of substances the Almighty has been pleased to give that power, which cannot be in any created being, but merely by the good pleasure and bounty of the Creator. For I see no contradiction in it, that the first eternal thinking being, should, if he pleased, give to certain systems of created senseless matter, put together as he thinks fit, some degrees of sense, perception, and thought: though, as I think, I have proved,Lib. 4. Ch. 10, 'tis no less a contradiction to suppose matter (which is evidently in its own nature void of sense and thought) should be that eternal first thinking being. What certainty of knowledge can anyone have that some perceptions, such as v.g. pleasure and pain,should not be in some bodies themselves, after a certain manner modified and moved, as well as that they should be in an immaterial substance, upon the motion of the parts of body: body as far as we can conceive being able only to strike and affect body and motion,according to the utmost reach of our ideas, being able to produce nothing but motion, so that when we allow it to produce pleasure or pain, or the idea of a colour, or sound, we are fain to quit our reason,go beyond our ideas, and attribute it wholly to the good pleasure of our Maker. For since we must allow he has annexed effects to motion, which we can no way conceive motion able to produce,what reason have we to conclude, that he could not order them as well to be produced in a subject we cannot conceive capable of them, as well as in a subject we cannot conceive the motion of matter can any way operate upon' I say not this, that I would any way lessen the belief of the soul's immateriality: I am not here speaking of probability, but knowledge; and I think not only, that it becomes the modesty of philosophy, not to pronounce magisterially,where we want that evidence that can produce knowledge; but also,that 'tis of use to us, to discern how far our knowledge does reach; for the state we are at present in, not being that of vision, we must, in many things, content ourselves with faith and probability: and in the present question, about the immateriality of the soul, if our faculties cannot arrive at demonstrative certainty,

we need not think it strange. All the great ends of morality and religion, are well enough secured, without philosophical proofs of the soul's immateriality; since 'tis evident, that he who made us at first begin to subsist here, sensible intelligent beings, and for several years continued us in such a state, can and will restore us to the like state of sensibility in another world, and make us capable there to receive the retribution he has designed to men, according to their doings in this life. And therefore 'tis not of such mighty necessity to determine one way or t'other, as some over zealous for, or against the immateriality of the soul, have been forward to make the world believe. Who, either on the one side, indulging too much their thoughts immersed altogether in matter, can allow no existence to what is not material: or, who on the other side, finding not cogitation within the natural powers of matter, examined over and over again, by the utmost intention of mind, have the confidence to conclude, that Omnipotency itself, cannot give perception and thought to a substance, which has the modification of solidity. He that considers how hardly sensation is, in our thoughts, reconcilable to extended matter; or existence to anything that has no extension at all, will confess, that he is very far from certainly knowing what his soul is. 'Tis a point, which seems to me, to be put out of the reach of our knowledge: and he who will give himself leave to consider freely, and look into the dark and intricate part of each hypothesis, will scarce find his reason able to determine him fixedly for, or against the soul's materiality. Since on which side soever he views it, either as an unextended substance, or as a thinking extended matter, the difficulty to conceive either, will, whilst either alone is in his thoughts, still drive him to the contrary side. An unfair way which some men take with themselves: who, because of the Inconceivableness of something they find in one, throw themselves violently into the contrary hypothesis, though altogether as unintelligible to an unbiassed understanding. This serves, not only to show the weakness and the scantiness of our knowledge, but the insignificant triumph of such sort of arguments, which, drawn from our own views, may satisfy us that we can find no certainty on one side of the question; but do not at all thereby help us to truth, by running into the opposite opinion, which, on examination, will be found clogged with equal difficulties. For what safety, what advantage to anyone is it, for the avoiding the seeming absurdities, and, to him, unsurmountable rubs he meets with in one opinion, to take refuge in the contrary, which is built on something altogether as inexplicable, and as far remote from his comprehension? 'Tis past controversy, that

we have in us something that thinks, our very doubts about what it is, confirm the certainty of its being, though we must content ourselves in the ignorance of what kind of being it is: and 'tis in vain to go about to be sceptical in this, as 'tis unreasonable in most other cases to be positive against the being of anything, because we cannot comprehend its nature. For I would fain know what substance exists that has not something in it, which manifestly baffles our understandings. Other spirits, who see and know the nature and inward constitution of things, how much must they exceed us in knowledge? To which if we add larger comprehension, which enables them at one glance to see the connexion and agreement of very many ideas, and readily supplies to them the intermediate proofs, which we by single and slow steps, and long poring in the dark, hardly at last find out, and are often ready to forget one before we have hunted out another, we may guess at some part of the happiness of superior ranks of spirits, who have a quicker and more penetrating sight, as well as a larger field of knowledge. But to return to the argument in hand, our knowledge, I say, is not only limited to the paucity and imperfections of the ideas we have, and which we employ it about, but even comes short of that too: but how far it reaches let us now inquire.

§7. How far our knowledge reaches. The affirmations or negations we make concerning the ideas we have, may, as I have before intimated in general, be reduced to these four sorts, viz. identity, co-existence, relation, and real existence. I shall examine how far our knowledge extends in each of these: §8. First, our knowledge of identity and diversity, as far as our ideas. First, as to identity and diversity, in this way of agreement or disagreement of our ideas, our intuitive knowledge is as far extended as our ideas themselves: and there can be no idea in the mind, which it does not presently, by an intuitive knowledge, perceive to be what it is, and to be different from any other.

§9. Secondly, of co-existence a very little way. Secondly, as to the second sort, which is the agreement, or disagreement of our ideas in co-existence, in this our knowledge is very short, though in this consists the greatest and most material part of our knowledge concerning substances. For our ideas of the species of substances, being, as I have showed, nothing but certain collections of simple ideas united in one subject, and so co-existing together: v.g. our idea of flame is a body hot, luminous, and moving upward; of gold, a body heavy to a certain

degree, yellow, malleable, and fusible. These, or some such complex ideas as these in men's minds, do these two names of the different substances, flame and gold, stand for. When we would know anything further concerning these, or any other sort of substances, what do we inquire but what other qualities, or powers, these substances have, or have not? Which is nothing else but to know what other simple ideas do, or do not co-exist with those that make up that complex idea'

§10. Because the connexion between most simple ideas is unknown. This, how weighty and considerable a part soever of human science, is yet very narrow, and scarce any at all. The reason whereof is, that the simple ideas whereof our complex ideas of substances are made up, are, for the most part such as carry with them, in their own nature, no visible necessary connexion, or inconsistency with any other simple ideas, whose co-existence with them we would inform ourselves about.

§11. Especially of secondary qualities. The ideas, that our complex ones of substances are made up of, and about which our knowledge, concerning substances, is most employed, are those of their secondary qualities; which depending all (as has been shown) upon the primary qualities of their minute and insensible parts; or, if not upon them, upon something yet more remote from our comprehension, 'tis impossible we should know, which have a necessary union or inconsistency one with another: For not knowing the root they spring from, not knowing what size, figure, and texture of parts they are, on which depend and from which result those qualities which make our complex idea of gold, 'tis impossible we should know what other qualities result from, or are incompatible with, the same constitution of the insensible parts of gold; and so consequently must always co-exist with that complex idea we have of it, or else are inconsistent with it.

§12. Because all connexion between any secondary and primary qualities is undiscoverable. Besides this ignorance of the primary qualities of the insensible parts of bodies, on which depend all their secondary qualities, there is yet another and more incurable part of ignorance, which sets us more remote from a certain knowledge of the co-existence, or inco-existence (if I may so say) of different ideas in the same subject; and that is, that there is no discoverable connexion between any secondary quality, and those primary qualities that it

depends on.

§13. That the size, figure and motion of one body should cause a change in the size, figure and motion of another body, is not beyond our conception; the separation of the parts of one body, upon the intrusion of another; and the change from rest to motion, upon impulse; these, and the like, seem to us to have some connexion one with another. And if we knew these primary qualities of bodies, we might have reason to hope, we might be able to know a great deal more of these operations of them one upon another: but our minds not being able to discover any connexion betwixt these primary qualities of bodies, and the sensations that are produced in us by them, we can never be able to establish certain and undoubted rules, of the consequence or co-existence of any secondary qualities, though we could discover the size, figure, or motion of those invisible parts, which immediately produce them. We are so far from knowing what figure, size, or motion of parts produce a yellow colour, a sweet taste, or a sharp sound, that we can by no means conceive how any size, figure, or motion of any particles, can possibly produce in us the idea of any colour, taste, or sound whatsoever; there is no conceivable connexion between the one and the other.

§14. In vain therefore shall we endeavour to discover by our ideas, (the only true way of certain and universal knowledge,) what other ideas are to be found constantly joined with that of our complex idea of any substance: since we neither know the real constitution of the minute parts, on which their qualities do depend; nor, did we know them, could we discover any necessary connexion between them, and any of the secondary qualities: which is necessary to be done, before we can certainly know their necessary co-existence. So that let our complex idea of any species of substances, be what it will, we can hardly, from the simple ideas contained in it, certainly determine the necessary co-existence of any other quality whatsoever. Our knowledge in all these inquiries, reaches very little further than our experience. Indeed, some few of the primary qualities have a necessary dependence, and visible connexion one with another, as figure necessarily supposes extension, receiving or communicating motion by impulse, supposes solidity. But though these, and perhaps some others of our ideas have: yet there are so few of them, that have a visible connexion one with another, that we can by intuition or demonstration, discover the co-existence of very few of the qualities

are to be found united in substances: and we are left only to the assistance of our senses, to make known to us, what qualities they contain. For of all the qualities that are co-existent in any subject, without this dependence and evident connexion of their ideas one with another, we cannot know certainly any two to co-existent any further, than experience, by our senses, informs us. Thus though we see the yellow colour, and upon trial find the weight, malleableness, fusibility, and fixedness, that are united in a piece of gold; yet because no one of these ideas has any evident dependence, or necessary connexion with the other, we cannot certainly know, that where any four of these are, the fifth will be there also, how highly probable soever it may be: because the highest probability, amounts not to certainty; without which, there can be no true knowledge. For this co-existence can be no further known, than 'tis perceived; and it cannot be perceived but either in particular subjects, by the observation of our senses, or in general, by the necessary connexion of the ideas themselves.

§15. Of repugnancy to co-exist larger. As to the incompatibility or repugnancy to co-existence, we may know, that any subject may have of each sort of primary qualities, but one particular at once, v.g. each particular extension, figure, number of parts, motion, excludes all other of each kind. The like also is certain of all sensible ideas peculiar to each sense; for whatever of each kind is present in any subject, excludes all other of that sort; v.g. no one subject can have two smells, or two colours, at the same time. To this, perhaps, will be said, has not an opal, or the infusion of *lignum nephriticum*, two colours at the same time? To which I answer, that these bodies, to eyes differently placed, may at the same time afford different colours: but I take liberty also to say, that to eyes differently placed, 'tis different parts of the object, that reflect the particles of light: and therefore 'tis not the same part of the object, and so not the very same subject, which at the same time appears both yellow and azure. For 'tis as impossible that the very same particle of any body, should at the same time differently modify, or reflect the rays of light, as that it should have two different figures and textures at the same time.

§16. Of the co-existence of powers a very little way. But as to the powers of substances to change the sensible qualities of other bodies, which make a great part of our inquiries about them, and is no inconsiderable branch of our knowledge; I doubt as to these, whether

our knowledge reaches much further than our experience; or whether we can come to the discovery of most of these powers, and be certain that they are in any subject, by the connexion with any of those ideas, which to us make its essence. Because the active and passive powers of bodies, and their ways of operating, consisting in a texture and motion of parts, which we cannot by any means come to discover: 'tis but in very few cases, we can be able to perceive their dependence on, or repugnance to any of those ideas, which make our complex one of that sort of things. I have here instanced in the corpuscularian hypothesis, as that which is thought to go furthest in an intelligible explication of the qualities of bodies; and I fear the weakness of human understanding is scarce able to substitute another, which will afford us a fuller and clearer discovery of the necessary connexion, and co-existence, of the powers, which are to be observed united in several sorts of them. This at least is certain, that whichever hypothesis be clearest and truest, (for of that 'tis not my business to determine,) our knowledge concerning corporeal substances, will be very little advanced by any of them, till we are made to see, what qualities and powers of bodies have a necessary connexion or repugnancy one with another; which in the present state of philosophy, I think, we know but to a very small degree: and, I doubt, whether with those faculties we have, we shall ever be able to carry our general knowledge (I say not particular experience) in this part much further. Experience is that, which in this part we must depend on. And it were to be wished, that it were more improved. We find the advantages some men's generous pains have this way brought to the stock of natural knowledge. And if others, especially the philosophers by fire, who pretend to it, had been so wary in their observations, and sincere in their reports, as those who call themselves philosophers ought to have been, our acquaintance with the bodies here about us, and our insight into their powers and operations had been yet much greater.

§17. Of spirits yet narrower. If we are at this loss in respect of the powers, and operations of bodies, I think 'tis easy to conclude, we are much more in the dark in reference to spirits; whereof we naturally have no ideas, but what we draw from that of our own, by reflecting on the operations of our own souls within us, as far as they can come within our observation. But how inconsiderable a rank the spirits that inhabit our bodies hold amongst those various, and possibly innumerable, kinds of nobler beings; and how far short they come of the endowments and perfections of cherubim and seraphim, and

infinite sorts of spirits above us, is what by a transient hint in another place, I have offered to my reader's consideration.

§18. Thirdly, of other relations 'tis not easy to say how far. As to the third sort of our knowledge, viz. the agreement or disagreement of any of our ideas in any other relation: this, as 'tis the largest field of our knowledge, so 'tis hard to determine how far it may extend: because the advances that are made in this part of knowledge, depending on our sagacity, in finding intermediate ideas, that may show the relations and habitudes of ideas, whose co-existence is not considered, 'tis a hard matter to tell, when we are at an end of such discoveries; and when reason has all the helps 'tis capable of, for the finding of proofs, or examining the agreement or disagreement of remote ideas. They that are ignorant of algebra, cannot imagine the wonders in this kind are to be done by it: and what further improvements and helps, advantageous to other parts of knowledge, the sagacious mind of man may yet find out, 'tis not easy to determine. This at least I believe, that the ideas of quantity are not those alone that are capable of demonstration and knowledge; and that other, and perhaps more useful parts of contemplation, would afford us certainty, if vices, passions, and domineering interest did not oppose, or menace such endeavours.

Morality capable of demonstration. The idea of a supreme being, infinite in power, goodness and wisdom, whose workmanship we are, and on whom we depend; and the idea of ourselves, as understanding, rational beings, being such as are clear in us, would, I suppose, if duly considered, and pursued, afford such foundations of our duty and rules of action, as might place morality amongst the sciences capable of demonstration: wherein I doubt not, but from selfevident propositions, by necessary consequences, as incontestible as those in mathematics, the measures of right and wrong might be made out, to anyone that will, apply himself with the same indifferency and attention to the one, as he does to the other of these sciences. The relation of other modes may certainly be perceived, as well as those of number and extension: and I cannot see, why they should not also be capable of demonstration, if due methods were thought on to examine, or pursue their agreement or disagreement. Where there is no property, there is no injustice, is a proposition as certain as any demonstration in Euclid: for the idea of property, being a right to anything; and the idea to which the name

injustice is given, being the invasion or violation of that right, 'tis evident, that these ideas being thus established, and these names annexed to them, I can as certainly know this proposition to be true, as that a triangle has three angles equal to two right ones. Again, 'no government allows absolute liberty': the idea of government being the establishment of society upon certain rules or laws, which require conformity to them; and the idea of absolute liberty being for any one to do whatever he pleases; I am as capable of being certain of the truth of this proposition, as of any in mathematics.

§19. Two things have made moral ideas thought incapable of demonstration. Their complexedness, and want of sensible representations. That which in this respect has given the advantage to the ideas of quantity, and made them thought more capable of certainty and demonstration, is,

First, that they can be set down, and represented by sensible marks, which have a greater and nearer correspondence with them than any words or sounds whatsoever. Diagrams drawn on paper are copies of the ideas in the mind, and not liable to the uncertainty that words carry in their signification. An angle, circle, or square, drawn in lines, lies open to the view, and cannot be mistaken: it remains unchangeable, and may at leisure be considered, and examined, and the demonstration be revised, and all the parts of it may be gone over more than once, without any danger of the least change in the ideas. This cannot be thus done in moral ideas, we have no sensible marks that resemble them, whereby we can set them down; we have nothing but words to express them by; which though, when written they remain the same, yet the ideas they stand for, may change in the same man; and 'tis very seldom that they are not different in different persons.

Secondly, another thing that makes the greater difficulty in ethics, is, that moral ideas are commonly more complex than those of the figures ordinarily considered in mathematics. From whence these two inconveniences follow. First, that their names are of more uncertain signification, the precise collection of simple ideas they stand for not being so easily agreed on and so the sign, that is used for them in communication always, and in thinking often, does not steadily carry with it the same idea. Upon which the same disorder, confusion, and error follow, as would if a man, going to demonstrate something of an

heptagon, should in the diagram he took to do it, leave out one of the angles, or by over-sight make the figure with one angle more than the name ordinarily imported, or he intended it should, when at first he thought of his demonstration. This often happens, and is hardly avoidable in very complex moral ideas, where the same name being retained, one angle, i.e. one simple idea, is left out or put in, in the complex one, (still called by the same name) more at one time than another. Secondly, from the complexedness of these moral ideas there follows another inconvenience, viz. that the mind cannot easily retain those precise combinations, so exact and perfectly, as is necessary in the examination of the habitudes and correspondences, agreements or disagreements, of several of them one with another; especially where 'tis to be judged of by long deductions, and the intervention of several other complex ideas, to show the agreement or disagreement of two remote ones.

The great help against this, which mathematicians find in diagrams and figures, which remain unalterable in their draughts, is very apparent, and the memory would often have great difficulty otherwise to retain them so exactly, whilst the mind went over the parts of them step by step, to examine their several correspondencies: and though in casting up a long sum, either in addition, multiplication, or division, every part be only a progression of the mind, taking a view of its own ideas, and considering their agreement or disagreement; and the resolution of the question be nothing but the result of the whole, made up of such particulars, whereof the mind has a clear perception: yet without setting down the several parts by marks, whose precise significations are known, and by marks that last and remain in view, when the memory had let them go, it would be almost impossible to carry so many different ideas in mind, without confounding or letting slip some parts of the reckoning, and thereby making all our reasonings about it useless. In which case, the cyphers or marks help not the mind at all to perceive the agreement of any two, or more numbers, their equalities or proportions: that the mind has only by intuition of its own ideas of the numbers themselves. But the numerical characters are helps to the memory, to record and retain the several ideas about which the demonstration is made, whereby a man may know how far his intuitive knowledge in surveying several of the particulars, has proceeded; that so he may without confusion go on to what is yet unknown; and, at last, have in one view before him the result of all his

perceptions and reasonings.

§20. Remedies of those difficulties. One part of these disadvantages in moral ideas, which has made them be thought not capable of demonstration, may in a good measure be remedied by definitions, setting down that collection of simple ideas, which every term shall stand for; and then using the terms steadily and constantly for that precise collection. And what methods algebra, or something of that kind, may hereafter suggest, to remove the other difficulties, 'tis not easy to foretell. Confident I am, that if men would in the same method, and with the same indifferency, search after moral, as they do mathematical truths, they would find them to have a stronger connexion one with another, and a more necessary consequence from our clear and distinct ideas, and to come nearer perfect demonstration, than is commonly imagined. But much of this is not to be expected, whilst the desire of esteem, riches, or power, makes men espouse the well endowed opinions in fashion, and then seek arguments, either to make good their beauty, or varnish over, and cover their deformity. Nothing being so beautiful to the eye, as truth is to the mind; nothing so deformed and irreconcilable to the understanding, as a lie. For though many a man can with satisfaction enough own a no very handsome wife in his bosom; yet who is bold enough openly to avow, that he has espoused a falsehood, and received into his breast so ugly a thing as a lie? Whilst the parties of men, cram their tenets down all men's throats, whom they can get into their power, without permitting them to examine their truth or falsehood; and will not let truth have fair play in the world, nor men the liberty to search after it; what improvements can be expected of this kind? What greater light can be hoped for in the moral sciences? The subject part of mankind, in most places, might, instead thereof, with Egyptian bondage, expect Egyptian darkness, were not the candle of the Lord set up by himself in men's minds, which 'tis impossible for the breath or power of man wholly to extinguish.

§21. Fourthly, of real existence we have an intuitive knowledge of our own, demonstrative of God's, sensible of some few other things. As to the fourth sort of knowledge, viz. of the real, actual existence of things, we have an intuitive knowledge of our own existence; a demonstrative knowledge of the existence of a God: of the existence of anything else, we have no other but a sensitive knowledge which extends not beyond the objects present to our senses.

§22. Our ignorance great. Our knowledge being so narrow, as I have showed, it will, perhaps, give us some light into the present state of our minds, if we look a little into the dark side, and take a view of our ignorance: which being infinitely larger than our knowledge, may serve much to the quieting of disputes, and improvement of useful knowledge; if discovering how far we have clear and distinct ideas, we confine our thoughts within the contemplation of those things, that are within the reach of our understandings, and launch not out into that abyss of darkness (where we have not eyes to see, nor faculties to perceive anything,) out of a presumption, that nothing is beyond our comprehension. But to be satisfied of the folly of such a conceit, we need not go far. He that knows anything, knows this in the first place, that he need not seek long for instances of his ignorance. The meanest, and most obvious things that come in our way, have dark sides, that the quickest sight cannot penetrate into. The clearest, and most enlarged understandings of thinking men find themselves puzzled, and at a loss, in every particle of matter. We shall the less wonder to find it so, when we consider the causes of our ignorance which, from what has been said, I suppose, will be found to be chiefly these three:

First, want of ideas.

Secondly, want of a discoverable connexion between the ideas we have.

Thirdly, want of tracing and examining our ideas.

§23. First, one cause of it want of ideas, either such as we have no conception of, or such as particularly we have not. First, there are some things, and those not a few, that we are ignorant of for want of ideas. First, all the simple ideas we have are confined (as I have shown) to those we receive from corporeal objects by sensation, and from the operations of our own minds as the objects of reflection. But how much these few and narrow inlets are disproportionate to the vast whole extent of all beings, will not be hard to persuade those, who are not so foolish, as to think their span the measure of all things. What other simple ideas 'tis possible the creatures in other parts of the universe may have, by the assistance of senses and faculties more or perfecter, than we have, or different from ours, 'tis not for us to determine. But to say or think there are no such, because we conceive nothing of them, is no better an argument, than if a blind man should be positive in it, that there was no such thing as sight and colours,

because he had no manner of idea of any such thing, nor could by any means frame to himself any notions about seeing. The ignorance, and darkness that is in us, no more hinders, nor confines the knowledge, that is in others, than the blindness of a mole is an argument against the quick-sightedness of an eagle. He that will consider the infinite power, wisdom, and goodness of the Creator of all things, will find reason to think, it was not all laid out upon so inconsiderable, mean, and impotent a creature, as he will find man to be; who in all probability, is one of the lowest of all intellectual beings. What faculties therefore, other species of creatures have to penetrate into the nature, and inmost constitutions of things; what ideas they may receive of them, far different of ours, we know not. This we know, and certainly find, that we want several other views of them, besides those we have, to make discoveries of them more perfect. And we may be convinced that the ideas, we can attain to by our faculties, are very disproportionate to things themselves, when a positive clear distinct one of substance itself, which is the foundation of all the rest, is concealed from us. But want of ideas of this kind being a part, as well as cause of our ignorance, cannot be described. Only this, I think, I may confidently say of it, That the intellectual and sensible world, are in this perfectly alike; that that part, which we see of either of them, holds no proportion with what we see not; and whatsoever we can reach with our eyes, or our thoughts of either of them, is but a point, almost nothing, in comparison of the rest.

§24. Because of their remoteness, or. Secondly, another great cause of ignorance, is the want of ideas we are capable of. As the want of ideas, which our faculties are not able to give us, shuts us wholly from those views of things, which 'tis reasonable to think other beings, perfecter than we, have, of which we know nothing; so the want of ideas, I now speak of, keeps us in ignorance of things, we conceive capable of being known to us. Bulk, figure, and motion, we have ideas of. But though we are not without ideas of these primary qualities of bodies in general, yet not knowing what is the particular bulk, figure, and motion, of the greatest part of the bodies of the universe, we are ignorant of the several powers, efficacies, and ways of operation, whereby the effects, which we daily see, are produced. These are hid from us in some things, by being too remote; and in others, by being too minute. When we consider the vast distance of the known and visible parts of the world, and the reasons we have to think, that what lies within our ken, is but a small part of the immense universe, we

shall then discover a huge abyss of ignorance. What are the particular fabrics of the great masses of matter, which make up the whole stupendous frame of corporeal beings; how far they are extended; what is their motion, and how continued, or communicated; and what influence they have one upon another, are contemplations, that at first glimpse our thoughts lose themselves in. If we narrow our contemplations, and confine our thoughts to this little canton, I mean this system of our Sun, and the grosser masses of matter, that visibly move about it, what several sorts of vegetables, animals, and intellectual corporeal beings, infinitely different from those of our little spot of Earth, may there probably be in the other planets, to the knowledge of which, even of their outward figures and parts we can no way attain, whilst we are confined to this Earth, there being no natural means, either by sensation or reflection, to convey their certain ideas into our minds. They are out of the reach of those inlets of all our knowledge: and what sorts of furniture and inhabitants those mansions contain in them, we cannot so much as guess, much less have clear, and distinct ideas of them.

§25. Because of their minuteness. If a great, nay far the greatest part of the several ranks of bodies in the universe, escape our notice by their remoteness, there are others that are no less concealed from us by their minuteness. These insensible corpuscles, being the active parts of matter, and the great instruments of nature, on which depend not only all their secondary qualities, but also most of their natural operations, our want of precise distinct ideas of their primary qualities, keeps us in an incurable ignorance of what we desire to know about them. I doubt not but if we could discover the figure, size, texture, and motion of the minute constituent parts of any two bodies, we should know without trial several of their operations one upon another as we do now the properties of a square, or a triangle. Did we know the mechanical affections of the particles of rhubarb, hemlock, opium, and a man, as a watchmaker does those of a watch, whereby it performs its operations and of a file which by rubbing on them will alter the figure of any of the wheels we should be able to tell beforehand that rhubarb will purge, hemlock kill, and opium make a man sleep, as well as a watchmaker can, that a little piece of paper laid on the balance will keep the watch from going, till it be removed; or that some small part of it, being rubbed by a file, the machine would quite lose its motion, and the watch go no more. The dissolving of silver in aqua fortis, and gold in aqua regia, and not vice versa,

would be then perhaps, no more difficult to know, than 'tis to a smith to understand, why the turning of one key will open a lock, and not the turning, of another. But whilst we are destitute of senses acute enough, to discover the minute particles of bodies, and to give us ideas of their, mechanical affections, we must be content to be ignorant of their properties and ways of operation; nor can we be assured about them any further, than some few trials we make, are able to reach. But whether they will succeed again another time, we cannot be certain. This hinders our certain knowledge of universal truths concerning natural bodies: and our reason carries us herein very little beyond particular matter of fact.

§26. Hence no science of bodies. And therefore I am apt to doubt that, how far soever human industry may advance useful and experimental philosophy in physical things, scientific will still be out of our reach: because we want perfect and adequate ideas of those very bodies, which are nearest to us, and most under our command. Those which we have ranked into classes under names, and we think ourselves best acquainted with, we have but very imperfect, and incomplete ideas of. Distinct ideas of the several sorts of bodies, that fall under the examination of our senses, perhaps, we may have: but adequate ideas, I suspect, we have not of any one amongst them. And though the former of these will serve us for common use and discourse: yet whilst we want the latter, we are not capable of scientific knowledge; nor shall ever be able to discover general, instructive, unquestionable truths concerning them. Certainty and demonstration, are things we must not, in these matters, pretend to. By the colour, figure, taste, and smell, and other sensible qualities, we have as clear, and distinct ideas of sage and hemlock, as we have of a circle and a triangle: but having no ideas of the particular primary qualities of the minute parts of either of these plants, nor of other bodies which we would apply them to, we cannot tell what effects they will produce; nor when we see those effects, can we so much as guess, much less know, their manner of production. Thus having no ideas of the particular mechanical affections of the minute parts of bodies, that are within our view and reach, we are ignorant of their constitutions, powers, and operations: and of bodies more remote, we are yet more ignorant not knowing so much as their very outward shapes or the sensible and grosser parts of their constitutions.

§27. Much less of spirits. This, at first sight, will show us how

disproportionate our knowledge is to the whole extent even of material beings; to which, if we add the consideration of that infinite number of spirits that may be, and probably are, which are yet more remote from our knowledge, whereof we have no cognizance, nor can frame to ourselves any distinct ideas of their several ranks and sorts, we shall find this cause of ignorance conceal from us, in an impenetrable obscurity, almost the whole intellectual world; a greater certainty, and more beautiful world than the material. For bating some very few, and those, if I may so call them, superficial ideas of spirit, which by reflection we get of our own, and from thence, the best we can collect, of the Father of all spirits, the eternal independent author of them and us and all things, we have no certain information, so much as of the existence of other spirits, but by revelation. Angels of all sorts are naturally beyond our discovery; and all those intelligences, whereof 'tis likely there are more orders than of corporeal substances, are things, whereof our natural faculties give us no certain account at all. That there are minds, and thinking beings in other men as well as himself, every man has a reason, from their words and actions, to be satisfied: and the knowledge of his own mind cannot suffer a man, that considers, to be ignorant, that there is a God. But that there are degrees of spiritual beings between us and the great God, who is there, that by his own search and ability can come to know' Much less have we distinct ideas of their different natures, conditions, states, powers, and several constitutions, wherein they agree or differ from one another, and from us. And therefore in what concerns their different species and properties, we are under an absolute ignorance.

§28. Secondly, want of a discoverable connexion between ideas we have. Secondly, What a small part of the substantial beings that are in the universe, the want of ideas leaves open to our knowledge, we have seen. In the next place, another cause of ignorance, of no less moment, is a want of a discoverable connexion between those ideas which we have. For wherever we want that, we are utterly incapable of universal and certain knowledge; and are, as in the former case, left only to observation and experiment: which how narrow and confined it is, how far from general knowledge, we need not be told. I shall give some few instances of this cause of our ignorance and so leave it. 'Tis evident that the bulk, figure, and motion of several bodies about us, produce in us several sensations, as of colours, sounds, tastes, smells, pleasure and pain, etc. These mechanical affections of bodies, having

no affinity at all with those ideas, they produce in us, (there being no conceivable connexion between any impulse of any sort of body, and any perception of a colour, or smell, which we find in our minds) we can have no distinct knowledge of such operations beyond our experience; and can reason no otherwise about them, than as effects produced by the appointment of an infinitely wise agent, which perfectly surpass our comprehensions. As the ideas of sensible secondary qualities, which we have in our minds, can, by us, be no way deduced from bodily causes, nor any correspondence or connexion be found between them and those primary qualities which (experience shows us) produce them in us; so on the other side, the operation of our minds upon our bodies is as inconceivable. How any thought should produce a motion in body is as remote from the nature of our ideas, as how any body should produce any thought in the mind. That 'tis so, if experience did not convince us, the consideration of the things themselves would never be able, in the least, to discover to us. These, and the like, though they have a constant and regular connexion, in the ordinary course of things: yet that connexion being not discoverable in the ideas themselves, which appearing to have no necessary dependence one on another, we can attribute their connexion to nothing else, but the arbitrary determination of that all-wise agent, who has made them to be, and to operate as they do, in a way wholly above our weak understandings to conceive.

§29. Instances. In some of our ideas there are certain relations, habitudes, and connexions, so visibly included in the nature of the ideas themselves, that we cannot conceive them separable from them, by any power whatsoever. And in these only, we are capable of certain and universal knowledge. Thus the idea of a rightned triangle necessarily carries with it an equality of its angles to two right ones. Nor can we conceive this relation, this connexion of these two ideas, to be possibly mutable, or to depend on any arbitrary power, which of choice made it thus, or could make it otherwise. But the coherence and continuity of the parts of matter; the production of sensation in us of colours and sounds, etc. by impulse and motion; nay, the original rules and communication of motion being such, wherein we can discover no natural connexion with any ideas we have, we cannot but ascribe them to the arbitrary will and good pleasure of the wise architect. I need not, I think, here mention the resurrection of the dead, the future state of this globe of Earth, and such other things, which are by everyone acknowledged to depend wholly on the

determination of a free agent. The things that, as far as our observation reaches, we constantly find to proceed regularly, we may conclude, do act by a law set them; but yet by a law, that we know not: whereby, though causes work steadily, and effects constantly flow from them, yet their connexions and dependencies being not discoverable in our ideas, we can have but an experimental knowledge of them. From all which 'tis easy to perceive what a darkness we are involved in, how little 'tis of being, and the things that are, that we are capable to know. And therefore we shall do no injury to our knowledge when we modestly think with ourselves, that we are so far from being able to comprehend the whole nature of the universe, and all the things contained in it, that we are not capable of a philosophical knowledge of the bodies that are about us, and make a part of us: concerning their secondary qualities, powers, and operations, we can have no universal certainty. Several effects come every day within the notice of our senses, of which we have so far sensitive knowledge: but the causes, manner, and certainty of their production, for the two foregoing reasons, we must be content to be ignorant of. In these we can go no further than particular experience informs us of matter of fact, and by analogy to guess what effects the like bodies are, upon other trials, like to produce. But as to a perfect science of natural bodies, (not to mention spiritual beings,) we are, I think, so far from being capable of any such thing, that I conclude it lost labour to seek after it.

§30. Thirdly, want of tracing our ideas. Thirdly, where we have adequate ideas, and where there is a certain and discoverable connexion between them, yet we are often ignorant, for want of tracing those ideas which we have, or may have; and for want of finding out those intermediate ideas, which may show us, what habitude of agreement or disagreement they have one with another. And thus many are ignorant of mathematical truths, not out of any imperfection of their faculties, or uncertainty in the things themselves; but for want of application in acquiring, examining, and by due ways comparing those ideas. That which has most contributed to hinder the due tracing of our ideas, and finding out their relations, and agreements or disagreements one with another, has been, I suppose, the ill use of words. 'Tis impossible that men should ever truly seek, or certainly discover the agreement or disagreement of ideas themselves, whilst their thoughts flutter about, or stick only in sounds of doubtful and uncertain significations. Mathematicians

abstracting their thoughts from names, and accustoming themselves to set before their minds, the ideas themselves, that they would consider, and not sounds instead of them, have avoided thereby a great part of that perplexity, puddering, and confusion, which has so much hindered men's progress in other parts of knowledge. For whilst they stick in words of undetermined and uncertain signification, they are unable to distinguish true from false, certain from probable, consistent from inconsistent, in their own opinions. This having been the fate or misfortune of a great part of the men of letters, the increase brought into the stock of real knowledge, has been very little, in proportion to the schools, disputes, and writings, the world has been filled with; whilst students, being lost in the great wood of words, knew not whereabouts they were, how far their discoveries were advanced, or what was wanting in their own, or the general stock of knowledge. Had men, in the discoveries of the material, done, as they have in those of the intellectual world, involved all in the obscurity of uncertain and doubtful ways of talking, volumes writ of navigation and voyages, theories and stories of zones and tides, multiplied and disputed; nay, ships built, and fleets set out, would never have taught us the way beyond the line; and the antipodes would be still as much unknown, as when it was declared heresy to hold there were any. But having spoken sufficiently of words, and the ill or careless use, that is commonly made of them, I shall not say anything more of it here.

§31. Extent in respect of universality. Hitherto we have examined the extent of our knowledge, in respect of the several sorts of beings that are. There is another extent of it, in respect of universality, which will also deserve to be considered: and in this regard, our knowledge follows the nature of our ideas. If the ideas are abstract, whose agreement or disagreement we perceive, our knowledge is universal. For what is known of such general ideas, will be true of every particular thing, in whom that essence, i.e. that abstract idea is to be found: and what is once known of such ideas, will be perpetually, and for ever true. So that as to all general knowledge, we must search and find it only in our own minds, and 'tis only the examining of our own ideas, that furnisheth us with that. Truths belonging to essences of things, (that is, to abstract ideas) are eternal, and are to be found out by the contemplation only of those essences: as the existence of things is to be known only from experience. But having more to say of this in the chapters, where I shall speak of general and real knowledge, this may here suffice as to the

universality of our knowledge in general.

Chapter IV Of the Reality of Knowledge

§1. Objection, knowledge placed in ideas may be all bare vision. I doubt not but my reader, by this time, may be apt to think, that I have been all this while only building a castle in the air; and be ready to say to me, to what purpose all this stir? Knowledge, say you, is only the perception of the agreement or disagreement of our own ideas: but who knows what those ideas may be? Is there anything so extravagant, as the imaginations of men's brains? Where is the head that has no chimeras in it? Or if there be a sober and a wise man, what difference will there be, by your rules, between his knowledge, and that of the most extravagant fancy in the world? They both have their ideas, and perceive their agreement and disagreement one with another. If there be any difference between them, the advantage will be on the warm-headed man's side, as having the more ideas, and the more lively. And so, by your rules, he will be the more knowing. If it be true, that all knowledge lies only in the perception of the agreement or disagreement of our own ideas, the visions of an enthusiast, and the reasonings of a sober man, will be equally certain. 'Tis no matter how things are: so a man observe but the agreement of his own imaginations, and talk conformably, 'tis all truth, all certainty. Such castles in the air, will be as strongholds of truth, as the demonstrations of Euclid. That an harpy is not a centaur, is by this way as certain knowledge, and as much a truth, as that a square is not a circle.

But of what use is all this fine knowledge of men's own imaginations, to a man that inquires after the reality of things? It matters not what men's fancies are, 'tis the knowledge of things that is only to be prized: 'tis this alone gives a value to our reasonings, and preference to one man's knowledge over another's, that 'tis of things as they really are, and not of dreams and fancies.

§2. Answer, not so, where ideas agree with things. To which I answer, That if our knowledge of our ideas terminate in them, and reach no further, where there is something further intended, our most serious thoughts will be of little more use, than the reveries of a crazy brain; and the truths built thereon of no more weight, than the discourses of a man, who sees, things clearly in a dream, and with great assurance utters them. But, I hope, before I have done, to make

it evident, that this way of certainty, by the knowledge of our own ideas, goes a little further than bare imagination: and, I believe it will appear, that all the certainty of general truths a man has, lies in nothing else.

§3. 'Tis evident, the mind knows not things immediately, but only by the intervention of the ideas it has of them. Our knowledge therefore is real, only so far as there is a conformity between our ideas and the reality of things. But what shall be here the criterion 'How shall the mind, when it perceives nothing but its own ideas, know that they agree with things themselves' This, though it seems not to want difficulty, yet, I think there be two sorts of ideas, that we may be assured, agree with things.

§4. As, first, all simple ideas do. First, the first are simple ideas, which since the mind, as has been showed, can by no means make to itself, must necessarily be the product of things operating on the mind in a natural way, and producing therein those perceptions which by the wisdom and will of our Maker they are ordained and adapted to. From whence it follows, that simple ideas are not fictions of our fancies, but the natural and regular productions of things without us, really operating upon us; and so carry with them all the conformity which is intended; or which our state requires: for they represent to us things under those appearances which they are fitted to produce in us: whereby we are enabled to distinguish the sorts of particular substances, to discern the states they are in, and so to take them for our necessities, and apply them to our uses. Thus the idea of whiteness, or bitterness, as 'tis in the mind, exactly answering that power which is in any body to produce it there, has all the real conformity it can, or ought to have, with things without us. And this conformity between our simple ideas, and the existence of things, is sufficient for real knowledge.

§5. Secondly, all complex ideas, except of substances. Secondly, all our complex ideas, except those of substances, being archetypes of the mind's own making, not intended to be the copies of anything, nor referred to the existence of anything, as to their originals, cannot want any conformity necessary to real knowledge. For that which is not designed to represent anything but itself, can never be capable of a wrong representation, nor mislead us from the true apprehension of anything, but its dislikeness to it: and such, excepting those of

substances, are all our complex ideas. Which, as I have showed in another place, are combinations of ideas, which the mind, by its free choice, puts together, without considering any connexion they have in nature. And hence it is, that in all these sorts the ideas themselves are considered as the archetypes, and things no otherwise regarded, but as they are conformable to them. So that we cannot but be infallibly certain, that all the knowledge we attain concerning these ideas is real, and reaches things themselves. Because in all our thoughts, reasonings, and discourses of this kind, we intend things no further, than as they are conformable to our ideas. So that in these, we cannot miss of a certain undoubted reality.

§6. Hence the reality of mathematical knowledge. I doubt not but it will be easily granted, that the knowledge we may have of mathematical truths, is not only certain, but real knowledge; and not the bare empty vision of vain insignificant chimeras of the brain: and yet, if we will consider, we shall find that 'tis only of our own ideas. The mathematician considers the truth and properties belonging to a rectangle, or circle, only as they are in idea in his own mind. For 'tis possible he never found either of them existing mathematically, i.e. precisely true, in his life. But yet the knowledge he has of any truths or properties belonging to a circle, or any other mathematical figure, are nevertheless true and certain, even of real things existing: because real things are no further concerned, nor intended to be meant by any such propositions, than as things really agree to those archetypes in his mind. Is it true of the idea of a triangle, that its three angles are equal to two right ones? 'Tis true also of a triangle, wherever it really exists. Whatever other figure exists, that is not exactly answerable to that idea of a triangle in his mind, is not at all concerned in that proposition. And therefore he is certain all his knowledge concerning such ideas, is real knowledge: because intending things no further than they agree with those his ideas, he is sure what he knows concerning those figures, when they have barely an ideal existence in his mind, will hold true of them also, when they have a real existence in matter; his consideration being barely of those figures, which are the same, wherever, or however they exist.

§7. And of moral. And hence it follows, that moral knowledge is as capable of real certainty, as mathematics. For certainty being but the perception of the agreement, or disagreement of our ideas; and demonstration nothing but the perception of such agreement, by the

intervention of other ideas or mediums our moral ideas, as well as mathematical, being archetypes themselves, and so adequate, and complete ideas all the agreement, or disagreement which we shall find in them, will produce real knowledge, as well as in mathematical figures.

§8. Existence not required to make it real. For the attaining of knowledge and certainty 'tis requisite, that we have determined ideas: and to make our knowledge real, 'tis requisite, that the ideas answer their archetypes. Nor let it be wondered, that I place the certainty of our knowledge in the consideration of our ideas, with so little care and regard (as it may seem) to the real existence of things: since most of those discourses, which take up the thoughts and engage the disputes of those who pretend to make it their business to inquire after truth and certainty, will, I presume, upon examination be found to be general propositions, and notions in which existence is not at all concerned. All the discourses of the mathematicians about the squaring of a circle, conic sections, or any other part of mathematics, concern not the existence of any of those figures, but their demonstrations, which depend on their ideas, are the same, whether there be any square or circle existing in the world, or no. In the same manner, the truth and certainty of moral discourses abstracts from the lives of men, and the existence of those virtues in the world, whereof they treat: nor are Tully's Offices less true, because there is nobody in the world that exactly practises his rules, and lives up to that pattern of a virtuous man, which he has given us, and which existed nowhere, when he writ, but in idea. If it be true in speculation, i.e. in idea, that murder deserves death, it will also be true in reality of any action that exists conformable to that idea of murder. As for other actions, the truth of that proposition concerns them not. And thus 'tis of all other species of things, which have no other essences, but those ideas, which are in the minds of men.

§9. Nor will it be less true or certain, because moral ideas are of our own making and naming. But it will here be said, that if moral knowledge be placed in the contemplation of our own moral ideas, and those, as other modes, be of our own making, what strange notions will there be of justice and temperance? What confusion of virtues and vices, if everyone may make what ideas of them he pleases? No confusion nor disorder in the things themselves, nor the reasonings about them; no more than (in mathematics) there would be a

disturbance in the demonstration, or a change in the properties of figures, and their relations one to another, if a man should make a triangle with four corners, or a trapezium with four right angles: that is, in plain English, change the names of the figures, and call that by one name, which mathematicians call ordinarily by another. For, let a man make to himself the idea of a figure with three angles, whereof one is a right one, and call it, if he please, equilaterum or trapezium, or anything else; the properties of, and demonstrations about that idea will be the same, as if he called it a rectangular-triangle. I confess, the change of the name, by the impropriety of speech, will at first disturb him, who knows not what idea it stands for: but as soon as the figure is drawn the consequences and demonstrations are plain and clear. Just the same is it in moral knowledge, let a man have the idea of taking from others, without their consent, what their honest industry has possessed them of, and call this justice, if he please. He that takes the name here without the idea put to it, will be mistaken, by joining another idea of his own to that name: but strip the idea of that name, or take it such as 'tis in the speaker's mind, and the same things will agree to it, as if you called it injustice. Indeed, wrong names in moral discourses, breed usually more disorder, because they are not so easily rectified, as in mathematics, where the figure once drawn and seen, makes the name useless and of no force. For what need of a sign, when the thing signified is present and in view? But in moral names, that cannot be so easily and shortly done, because of the many decompositions that go to the making up of the complex ideas of those modes. But yet for all this the miscalling of any of those ideas, contrary to the usual signification of the words of that language, hinders not, but that we may have certain and demonstrative knowledge of their several agreements and disagreements, if we will carefully, as in mathematics, keep to the same precise ideas, and trace them in their several relations one to another, without being led away by their names. If we but separate the idea under consideration from the sign that stands for it, our knowledge goes equally on in the discovery of real truth and certainty, whatever sounds we make use of.

§10. Misnaming disturbs not the certainty of the knowledge. One thing more we are to take notice of, That where God, or any other law-maker, hath defined any moral names, there they have made the essence of that species to which that name belongs; and there 'tis not safe to apply or use them otherwise: but in other cases 'tis bare

impropriety of speech to apply them contrary to the common usage of the country. But yet even this too disturbs not the certainty of that knowledge, which is still to be had by a due contemplation and comparing of those even nicknamed ideas.

§11. Ideas of substances have their archetypes without us. Thirdly, there is another sort of complex ideas, which being referred to archetypes without us, may differ from them, and so our knowledge about them, may come short of being real. Such are our ideas of substances, which consisting of a collection of simple ideas, supposed taken from the works of nature, may yet vary from them, by having more or different ideas united in them, than are to be found united in the things themselves: from whence it comes to pass, that they may, and often do fail of being exactly conformable to things themselves.

§12. So far as they agree with those, so far our knowledge concerning them is real. I say then, that to have ideas of substances, which, by being conformable to things, may afford us real knowledge, 'tis not enough, as in modes, to put together such ideas as have no inconsistency, though they did never before so exist V.g. the ideas of sacrilege or perjury, etc. were as real and true ideas before, as after the existence of any such fact. But our ideas of substances being supposed copies, and referred to archetypes without us, must still be taken from something that does or has existed; they must not consist of ideas put together at the pleasure of our thoughts, without any real pattern they were taken from, though we can perceive no inconsistency in such a combination. The reason whereof is, because we knowing not what real constitution 'tis of substances, whereon our simple ideas depend, and which really is the cause of the strict union of some of them one with another, and the exclusion of others, there are very few of them, that we can be sure are or are not inconsistent in nature, any further than experience and sensible observation reaches. Herein therefore is founded the reality of our knowledge concerning substances, that all our complex ideas of them must be such, and such only, as are made up of such simple ones, as have been discovered to co-exist in nature. And our ideas being thus true, though not, perhaps, very exact copies, are yet the subjects of real (as far as we have any) knowledge of them. Which (as has been already showed) will not be found to reach very far: but so far as it does, it will still be real knowledge. Whatever ideas we have, the agreement we find they have with others, will still be knowledge. If those ideas

be abstract, it will be general knowledge. But to make it real concerning substances, the ideas must be taken from the real existence of things. Whatever simple ideas have been found to coexist in any substance, these we may with confidence join together again, and so make abstract ideas of substances. For whatever have once had an union in nature, may be united again.

§13. In our inquiries about substances, we must consider ideas, and not confine our thoughts to names or species supposed set out by names. This, if we rightly consider, and confine not our thoughts and abstract ideas to names, as if there were, or could be no other sorts of things than what known names had already determined, and as it were set out, we should think of things with greater freedom and less confusion, than perhaps we do. 'Twould possibly be thought a bold paradox, if not a very dangerous falsehood, if I should say, that some changelings, who have lived forty years together, without any appearance of reason, are something between a man and a beast: which prejudice is founded upon nothing else but a false supposition, that these two names, man and beast, stand for distinct species so set out by real essences, that there can come no other species between them: whereas if we will abstract from those names, and the supposition of such specific essences made by nature, wherein all things of the same denominations did exactly and equally partake; if we would not fancy that there were a certain number of these essences, wherein all things, as in moulds, were cast and formed, we should find that the idea of the shape, motion, and life of a man without reason, is as much a distinct idea, and makes as much a distinct sort of things from man and beast, as the idea of the shape of an ass with reason would be different from either that of man or beast, and be a species of an animal between, or distinct from both.

§14. Objection against a changeling, being something between a man and beast, answered. Here everybody will be ready to ask, if changelings may be supposed something between man and beast, pray what are they? I answer, changelings, which is as good a word to signify something different from the signification of MAN or BEAST, as the names man and beast are to have significations different one from the other. This, well considered, would resolve this matter, and show my meaning without any more ado. But I am not so unacquainted with the zeal of some men, which enables them to spin consequences, and to see religion threatened, whenever anyone

ventures to quit their forms of speaking, as not to foresee what names such a proposition as this is like to be charged with: and without doubt it will be asked, if changelings are something between man and beast, what will become of them in the other world' To which I answer, I. it concerns me not to know or inquire. To their own master they stand or fall. It will make their state neither better nor worse, whether we determine anything of it, or no. They are in the hands of a faithful creator and a bountiful father, who disposes not of his creatures according to our narrow thoughts or opinions, nor distinguishes them according to names and species of our contrivance. And we that know so little of this present world we are in, may, I think, content ourselves without being peremptory in defining the different states, which creatures shall come into, when they go off this stage. It may suffice us, that he hath made known to all those, who are capable of instruction, discourse, and reasoning, that they shall come to an account, and receive according to what they have done in this body.

§15. But, secondly, I answer, The force of these men's question (viz. will you deprive changelings of a future state') is founded on one of two suppositions, which are both false. The first is, That all things that have the outward shape and appearance of a man, must necessarily be designed to an immortal future being after this life. Or, secondly, that whatever is of human birth, must be so. Take away these imaginations, and such questions will be groundless and ridiculous. I desire then those, who think there is no more but an accidental difference between themselves and changelings, the essence in both being exactly the same, to consider, whether they can imagine immortality annexed to any outward shape of the body; the very proposing it, is, I suppose, enough to make them disown it. No one yet, that ever I heard of, how much soever immersed in matter, allowed that excellency to any figure of the gross sensible outward parts, as to affirm eternal life due to it, or a necessary consequence of it; or that any mass of matter should, after its dissolution here, be again restored hereafter to an everlasting state of sense, perception, and knowledge, only because it was moulded into this or that figure, and had such a particular frame of its visible parts. Such an opinion as this, placing immortality in a certain superficial figure, turns out of doors all consideration of soul or spirit, upon whose account alone some corporeal beings have hitherto been concluded immortal, and others not. This is to attribute more to the

outside, than inside of things; to place the excellency of a man, more in the external shape of his body, than internal perfections of his soul: which is but little better than to annex the great and inestimable advantage of immortality and life everlasting, which he has above other material beings, to annex it, I say, to the cut of his beard, or the fashion of his coat. For this or that outward mark of our bodies, no more carries with it the hopes of an eternal duration, than the fashion of a man's suit gives him reasonable grounds to imagine it will never wear out, or that it will make him immortal. 'Twill perhaps be said, that nobody thinks that the shape makes anything immortal, but 'tis the shape is the sign of a rational soul within, which is immortal. I wonder who made it the sign of any such thing: for barely saying it, will not make it so. It would require some proofs to persuade one of it. No figure that I know speaks any such language. For it may as rationally be concluded, that the dead body of a man, wherein there is to be found no more appearance or action of life, than there is in a statue, has yet nevertheless a living soul in it, because of its shape; as that there is a rational soul in a changeling, because he has the outside of a rational creature, when his actions carry far less marks of reason with them, in the whole course of his life, than what are to be found in many a beast.

§16. Monsters. But 'tis the issue of rational parents, and must therefore be concluded to have a rational soul. I know not by what logic you must so conclude. I am sure this is a conclusion, that men nowhere allow of. For if they did, they would not make bold, as everywhere they do, to destroy ill-formed and miss-hap'd productions. Ay, but these are monsters. Let them be so; what will your drivelling, unintelligent, intractable changeling be? Shall a defect in the body make a monster; a defect in the mind (the far more noble, and, in the common phrase, the far more essential part) not? Shall the want of a nose, or a neck, make a monster, and put such issue out of the rank of men; the want of reason and understanding, not? This is to bring all back again to what was exploded just now: this is to place all in the shape, and to take the measure of a man only by his outside. To show that, according to the ordinary way of reasoning in this matter, people do lay the whole stress on the figure, and resolve the whole essence of the species of man (as they make it) into the outward shape, how unreasonable soever, it be, and how much soever they disown it, we need but trace their thoughts and practice a little further, and then it will plainly appear. The wellshaped changeling is

a man, has a rational soul, though it appear not; this is past doubt, say you. Make the ears a little longer, and more pointed, and the nose a little flatter than ordinary, and then you begin to boggle: make the face yet narrower, flatter, and longer, and then you are at a stand: add still more and more of the likeness of a brute to it, and let the head be perfectly that of some other animal, then presently 'tis a monster; and 'tis demonstration with you that it hath no rational soul, and must be destroyed. Where now (I ask) shall be the just measure; which the utmost bounds of that shape, that carries with it a rational soul? For since there have been human foetus's produced, half beast, and half man; and others three parts one, and one part t'other; and so 'tis possible they may be in all the variety of approaches to the one or the other shape, and may have several degrees of mixture of the likeness of a man, or a brute, I would gladly know what are those precise lineaments, which according to this hypothesis, are or are not capable of a rational soul to be joined to them. What sort of outside is the certain sign that there is or is not such an inhabitant within? For till that be done, we talk at random of man: and shall always, I fear, do so, as long as we give ourselves up to certain sounds, and the imaginations of settled and fixed species in nature, we know not what. But after all, I desire it may be considered, that those who think they have answered the difficulty, by telling us, that a misshaped foetus is a monster, run into the same fault they are arguing against, by constituting a species between man and beast. For what else, I pray, is their monster in the case, (if the word monster signifies anything at all) but something neither man nor beast, but partaking somewhat of either: and just so is the changeling before-mentioned. So necessary is it to quit the common notion of species and essences, if we will truly look into the nature of things, and examine them, by what our faculties can discover in them as they exist, and not by groundless fancies, that have been taken up about them.

§17. Words and species. I have mentioned this here, because I think we cannot be too cautious, that words and species, in the ordinary notions which we have been used to of them, impose not on us. For I am apt to think, therein lies one great obstacle to our clear and distinct knowledge, especially in reference to substances; and from thence has risen a great part of the difficulties about truth and certainty. Would we accustom ourselves to separate our contemplations and reasonings from words, we might, in a great measure, remedy this inconvenience within our own thoughts: but yet

it would still disturb us in our discourse with others, as long as we retained the opinion, that species and their essences were anything else but our abstract ideas, (such as they are) with names annexed to them, to be the signs of them.

§18. Recapitulation. Wherever we perceive the agreement or disagreement of any of our ideas there is certain knowledge: and wherever we are sure those ideas agree with the reality of things, there is certain real knowledge. Of which agreement of our ideas with the reality of things, having here given the marks, I think I have shown wherein 'tis, that certainty, real certainty, consists. Which whatever it was to others, was, I confess, to me heretofore, one of those desiderata which I found great want of.

Chapter V Of Truth in General

§1. What truth is. What is truth, was an inquiry many ages since; and it being that which all mankind either do, or pretend to search after, it cannot but be worth our while carefully to examine wherein it consists; and so acquaint ourselves with the nature of it, as to observe how the mind distinguishes it from falsehood.

§2. A right joining, or separating of signs; i.e. ideas or words. Truth then seems to me, in the proper import of the word, to signify nothing but the joining or separating of signs, as the things signified by them, do agree or disagree one with another. The joining or separating of signs here meant is what by another name, we call proposition. So that truth properly belongs only to propositions: whereof there are two sorts, viz. mental and verbal; as there are two sorts of signs commonly made use of, viz. ideas and words.

§3. Which make mental or verbal propositions. To form a clear notion of truth, 'tis very necessary to consider truth of thought, and truth of words, distinctly one from another: but yet 'tis very difficult to treat of them asunder. Because 'tis unavoidable, in treating of mental propositions, to make use of words: and then the instances given of mental propositions, cease immediately to be barely mental, and become verbal. For a mental proposition being nothing but a bare consideration of the ideas, as they are in our minds, stripped of names, they lose the nature of purely mental propositions, as soon as they are put into words.

§4. Mental propositions are very hard to be treated of. And that which makes it yet harder to treat of mental and verbal propositions separately is, that most men, if not all, in their thinking and reasonings within themselves, make use of words instead of ideas; at least when the subject of their meditation contains in it complex ideas. Which is a great evidence of the imperfection and uncertainty of our ideas of that kind, and may, if attentively made use of, serve for a mark to show us, what are those things, we have clear and perfect established ideas of, and what not. For if we will curiously observe the way our mind takes in thinking and reasoning, we shall find, I suppose, that when we make any propositions within our own thoughts, about white or black, sweet or bitter, a triangle or a circle, we can and often do frame in our minds the ideas themselves, without reflecting on the names. But when we would consider, or make propositions about the more complex ideas, as of a man, vitriol, fortitude, glory, we usually put the name for the idea: because the ideas these names stand for, being for the most part imperfect, confused, and undetermined, we reflect on the names themselves, because they are more clear, certain, and distinct, and readier occur to our thoughts than the pure ideas: and so we make use of these words instead of the ideas themselves, even when we would meditate and reason within ourselves, and make tacit mental propositions. In substances, as has been already noted, this is occasioned by the imperfections of our ideas: we making the name stand for the real essence, of which we have no idea at all. In modes, 'tis occasioned by the great number of simple ideas, that go to the making them up. For many of them being compounded, the name occurs much easier, than the complex idea itself, which requires time and attention to be recollected, and exactly represented to the mind, even in those men, who have formerly been at the pains to do it; and is utterly impossible to be done by those, who though they have ready in their memory, the greatest part of the common words of that language, yet perhaps never troubled themselves in all their lives, to consider what precise ideas the most of them stood for. Some confused or obscure notions have served their turns; and many who talk very much of religion and conscience, of church and faith, of power and right, of obstructions and humours, melancholy, and choler, would, perhaps, have little left in their thoughts and meditations, if one should desire them to think only of the things themselves, and lay by those words, with which they so often confound others, and not seldom themselves also.

§5. Being nothing but the joining, or separating ideas without words. But to return to the consideration of truth. We must, I say, observe two sorts of propositions, that we are capable of making.

First, mental, wherein the ideas in our understandings are without the use of words put together, or separated by the mind perceiving or judging of their agreement, or disagreement.

Secondly, verbal propositions, which are words the signs of our ideas put together or separated in affirmative or negative sentences. By which way of affirming or denying, these signs, made by sounds, are, as it were put together or separated one from another. So that proposition consists in joining, or separating signs, and truth consists in the putting together, or separating these signs, according as the things, which they stand for, agree or disagree.

§6. When mental propositions contain real truth, and when verbal. Everyone's experience will satisfy him, that the mind, either by perceiving or supposing the agreement or disagreement of any of its ideas, does tacitly within itself put them into a kind of proposition affirmative or negative, which I have endeavoured to express by the terms putting together and separating. But this action of the mind, which is so familiar to every thinking and reasoning man, is easier to be conceived by reflecting on what passes in us, when we affirm or deny, than to be explained by words. When a man has in his mind the idea of two lines, viz. the side and diagonal of a square, whereof the diagonal is an inch long, he may have the idea also of the division of that line into a certain number of equal parts; v.g. into five, ten, a hundred, an thousand, or any, other number, and may have the idea of that inch line, being divisible or not divisible, into such equal parts, as a certain number of them will be equal to the side-line. Now whenever he perceives, believes, or supposes such a kind of divisibility to agree or disagree to his idea of that line, he, as it were, joins or separates those two ideas, viz. the idea of that line, and the idea of that kind of divisibility, and so makes a mental proposition, which is true or false, according as such a kind of divisibility, a divisibility into such aliquot parts, does really agree to that line, or no. When ideas are so put together, or separated in the mind, as they or the things they stand for do agree, or not, that is, as I may call it, mental truth. But truth of words is something more; and that is the affirming or denying of words one of another, as the ideas

they stand for agree or disagree: and this again is twofold. Either purely verbal and trifling, which I shall speak of, chap. 10 or real and instructive; which is the object of that real knowledge, which, we have spoken of already.

§7. Objection against verbal truth, that thus it may all be chimerical. But here again will be apt to occur the same doubt about truth, that did about knowledge: and it will be objected, that if truth be nothing but the joining or separating of words in propositions, as the ideas they stand for agree or disagree in men's minds, the knowledge of truth is not so valuable a thing, as 'tis taken to be: nor worth the pains and time men employ to the search of it: since by this account, it amounts to no more than the conformity of words to the chimeras of men's brains. Who knows not what odd notions many men's heads are filled with, and what strange ideas all men's brains are capable of? But if we rest here, we know the truth of nothing by this rule, but of the visionary world in our own imaginations; nor have other truth, but what as much concerns harpies and centaurs, as men and horses. For those, and the like, may be ideas in our heads, and have their agreement and disagreement there, as well as the ideas of real beings, and so have as true propositions made about them. And 'twill be altogether as true a proposition, to say all centaurs are animals, as that all men are animals; and the certainty of one, as great as the other. For in both the propositions, the words are put together according to the agreement of the ideas in our minds: and the agreement of the idea of animal, with that of centaur, is as clear and visible to the mind, as the agreement of the idea of animal, with that of man; and so these two propositions are equally true, equally certain. But of what use is all such truth to us?

§8. Answered, real truth is about ideas agreeing to things. Though what has been said in the foregoing chapter, to distinguish real from imaginary knowledge might suffice here, in answer to this doubt, to distinguish real truth from chimerical, or (if you please,) barely nominal, they depending both on the same foundation; yet it may not be amiss here again to consider, that though our words signify nothing but our ideas, yet being designed by them to signify things, the truth they contain, when put into propositions, will be only verbal, when they stand for ideas in the mind, that have not an agreement with the reality of things. And therefore truth, as well as knowledge, may well come under the distinction of verbal and real; that being only verbal

truth, wherein terms are joined according to the agreement or disagreement of the ideas they stand for, without regarding whether our ideas are such, as really have, or are capable of having an existence in nature. But then 'tis they contain real truth, when these signs are joined, as our ideas agree; and when our ideas are such, as we know are capable of having an existence in nature: which in substances we cannot know, but by knowing that such have existed.

§9. Falsehood is the joining of names otherwise than their ideas agree. Truth is the marking down in words, the agreement or disagreement of ideas as it is. Falsehood is the marking down in words, the agreement or disagreement of ideas otherwise than it is. And so far as these ideas, thus marked by sounds, agree to their archetypes, so far only is the truth real. The knowledge of this truth consists in knowing what ideas the words stand for, and the perception of the agreement or disagreement of those ideas, according as 'tis marked by those words.

§10. General propositions to be treated of more at large. But because words are looked on as the great conduits of truth and knowledge, and that in conveying and receiving of truth, and commonly in reasoning about it, we make use of words and propositions, I shall more at large inquire, wherein the certainty of real truths, contained in propositions, consists, and where 'tis to be had; and endeavour to show in what sort of universal propositions we are capable of being certain of their real truth, or falsehood.

I shall begin with general propositions, as those which most employ our thoughts, and exercise our contemplation. General truths are most looked after by the mind, as those that most enlarge our knowledge; and by their comprehensiveness, satisfying us at once of many particulars, enlarge our view, and shorten our way to knowledge.

§11. Moral and metaphysical truth. Besides, truth taken in the first sense before-mentioned, there are other sorts of truths; as, 1.

Moral truth, which is speaking things according to the persuasion of our own minds, though the proposition we speak agree not to the reality of things. 2. Metaphysical truth, which is nothing but the real existence of things, conformable to the ideas to which we have annexed their names. This, though it seems to consist in the very

beings of things, yet when considered a little nearly, will appear to include a tacit proposition, whereby the mind joins that particular thing to the idea it had before settled with a name to it. But these considerations of truth, either having been before taken notice of, or not being much to our present purpose, it may suffice here only to have mentioned them.

Chapter VI Of Universal Propositions, their Truth and Certainty

§1. Treating of words necessary to knowledge. Though the examining and judging of ideas by themselves, their names being quite laid aside, be the best and surest way to clear and distinct knowledge: yet through the prevailing custom of using sounds for ideas, I think 'tis very seldom practised. Everyone may observe how common 'tis for names to be made use of, instead of the ideas themselves, even when men think and reason within their own breasts; especially if the ideas be very complex, and made up of a great collection of simple ones. This makes the consideration of words and propositions so necessary a part of the treatise of knowledge, that 'tis very hard to speak intelligibly of the one, without explaining the other.

§2. General truths hardly to be understood, but in verbal propositions. All the knowledge we have, being only of particular or general truths, 'tis evident that whatever may be done in the former of these, the latter, which is that which with reason is most sought after, can never be well made known, and is very seldom apprehended, but as conceived and expressed in words. 'Tis not therefore out of our way, in the examination of our knowledge, to inquire into the truth and certainty of universal propositions.

§3. Certainty twofold, of truth and of knowledge. But that we may not be misled in this case, by that which is the danger everywhere, I mean by the doubtfulness of terms, 'tis fit to observe, that certainty is twofold; certainty of truth, and certainty of knowledge. Certainty of truth is, when words are so put together in propositions, as exactly to express the agreement or disagreement of the ideas they stand for, as really it is. Certainty of knowledge is, to perceive the agreement or disagreement of ideas, as expressed in any proposition. This we usually call knowing, or being certain of the truth of any proposition.

§4. No proposition can be known to be true, where the essence of each species mentioned is not known. Now because we cannot be certain of the truth of any general proposition, unless we know the precise bounds and extent of the species its terms stand for, 'tis necessary we should know the essence of each species, which is that which constitutes and bounds it. This, in all simple ideas and modes, is not hard to do. For in these, the real and nominal essence being the same; or which is all one, the abstract idea, which the general term stands for, being the sole essence and boundary that is or can be supposed, of the species, there can be no doubt, how far the species extends, or what things are comprehended under each term; which, 'tis evident, are all, that have an exact conformity with the idea it stands for, and no other. But in substances, wherein a real essence, distinct from the nominal, is supposed to constitute, determine, and bound the species, the extent of the general word is very uncertain: because not knowing this real essence, we cannot know what is, or is not of that species, and consequently, what may, or may not with certainty be affirmed of it. And thus speaking of a man, or gold, or any other species of natural substances, as supposed constituted by a precise real essence, which nature regularly imparts to every individual of that kind, whereby 'tis made to be of that species, we cannot be certain of the truth of any affirmation or negation made of it. For man, or gold, taken in this sense, and used for species of things, constituted by real essences, different from the complex idea in the mind of the speaker, stand for we know not what: and the extent of these species, with such boundaries, are so unknown and undetermined, that 'tis impossible with any certainty, to affirm, that all men are rational, or that all gold is yellow. But where the nominal essence is kept to, as the boundary of each species, and men extend the application of any general term no further than to the particular things, in which the complex idea it stands for is to be found, there they are in no danger to mistake the bounds of each species, nor can be in doubt, on this account, whether any proposition be true, or no. I have chose to explain this uncertainty of propositions in this scholastic way, and have made use of the terms of essences and species, on purpose to show the absurdity and inconvenience there is to think of them as of any other sort of realities, than barely abstract ideas with names to them. To suppose, that the species of things are anything, but the sorting of them under general names, according as they agree to several abstract ideas, of which we make those names the signs, is to confound truth, and introduce uncertainty into all general propositions, that can be made

about them. Though therefore these things might, to people not possessed with scholastic learning, be perhaps treated of, in a better and clearer way; yet those wrong notions of essences or species, having got root in most people's minds, who have received any tincture from the learning, which has prevailed in this part of the world, are to be discovered and removed, to make way for that use of words, which should convey certainty with it.

§5. This more particularly concerns substances. The names of substances then, whenever made to stand for species, which are supposed to be constituted by real essences, which we know not, are not capable to convey certainty to the understanding: of the truth of general propositions made up of such terms we cannot be sure. The reason whereof is plain. For how can we be sure that this or that quality is in gold, when we know not what is or is not gold. Since in this way of speaking nothing is gold, but what partakes of an essence, which we not knowing, cannot know where 'tis, or is not, and so cannot be sure, that any parcel of matter in the world is or is not in this sense gold; being incurably ignorant, whether it has or has not that which makes anything to be called gold i.e. that real essence of gold whereof we have no idea at all. This being as impossible for us to know, as 'tis for a blind man to tell in what flower the colour of a pansy is, or is not to be found, whilst he has no idea of the colour of a pansy at an. Or if we could (which is impossible) certainly know where a real essence, which we know not, is, v.g. in what parcels of matter the real essence of gold is, yet could we not be sure, that this or that quality could with truth be affirmed of gold; since 'tis impossible for us to know, that this or that quality or idea has a necessary connexion with a real essence, of which we have no idea at all, whatever species that supposed real essence may be imagined to constitute.

§6. The truth of few universal propositions concerning substances, is to be known. On the other side, the names of substances, when made use of as they should be, for the ideas men have in their minds, though they carry a clear and determinate signification with them, will not yet serve us to make many universal propositions, of whose truth we can be certain. Not because in this use of them we are uncertain what things are signified by them, but because the complex ideas they stand for, are such combinations of simple ones, as carry not with them any discoverable connexion or repugnancy, but with a

very few other ideas.

§7. Because co-existence of ideas in few cases to be known. The complex ideas, that our names of the species of substances properly stand for, are collections of such qualities, as have been observed to co-exist in an unknown substratum which we call substance; but what other qualities necessarily co-exist with such combinations, we cannot certainly know, unless we can discover their natural dependence; which in their primary qualities, we can go but a very little way in; and in all their secondary qualities we can discover no connexion at all, for the reasons mentioned, chap. 3. viz. 1. Because we know not the real constitutions of substances, on which each secondary quality particularly depends. 2. Did we know that, it would serve us only for experimental (not universal) knowledge; and reach with certainty no further, than that bare instance. because our understandings can discover no conceivable connexion between any secondary quality, and any modification whatsoever of any of the primary ones. And therefore there are very few general propositions to be made concerning substances, which can carry with them undoubted certainty.

§8. Instance in gold. 'All gold is fixed', is a proposition whose truth we cannot be certain of, how universally soever it be believed. For if, according to the useless imagination of the Schools, anyone supposes the term gold to stand for a species of things set out by nature, by a real essence belonging to it, 'tis evident he knows not what particular substances are of that species; and so cannot, with certainty, affirm anything universally of gold. But if he makes gold stand for a species, determined by its nominal essence, let the nominal essence, for example, be the complex idea of a body, of a certain yellow colour, malleable, fusible, and heavier than any other known; in this proper use of the word gold, there is no difficulty to know what is, or is not gold. But yet no other quality can with certainty be universally affirmed or denied of gold, but what hath a discoverable connexion, or inconsistency with that nominal essence. Fixedness, for example, having no necessary connexion, that we can discover, with the colour, weight, or any other simple idea of our complex one, or with the whole combination together; 'tis impossible that we should certainly know the truth of this proposition, That all gold is fixed.

§9. As there is no discoverable connexion between fixedness and

the colour, weight, and other simple ideas of that nominal essence of gold; so if we make our complex idea of gold, a body yellow, fusible, ductile, weighty, and fixed, we shall be at the same uncertainty concerning solubility in aqua regia; and for the same reason. Since we can never, from consideration of the ideas themselves, with certainty affirm or deny, of a body, whose complex idea is made up of yellow, very weighty, ductile, fusible, and fixed, that 'tis soluble in aqua regia: and so on of the rest of its qualities. I would gladly meet with one general affirmation, concerning any quality of gold, that anyone can certainly know is true. It will, no doubt, be presently objected, Is not this an universal certain proposition, 'all gold is malleable'? To which I answer, 'Tis a very certain proposition, if malleableness be a part of the complex idea the word gold stands for. But then here is nothing affirmed of gold, but that that sound stands for an idea in which malleableness is contained: and such a sort of truth and certainty as this, 'tis to say a centaur is four-footed. But if malleableness make not a part of the specific essence the name of gold stands for, 'tis plain, 'all gold is malleable', is not a certain proposition. Because, let the complex idea of gold, be made up of which soever of its other qualities you please, malleableness will not appear to depend on that complex idea; nor follow from any simple one contained in it. The connexion that malleableness has (if it has any) with those other qualities, being only by the intervention of the real constitution of its insensible parts which, since we know not, 'tis impossible we should perceive that connexion, unless we could discover that which ties them together.

§10. As far as any such co-existence can be known, so far universal propositions may be certain. But this will go but a little way, because, The more, indeed, of these co-existing qualities we unite into one complex idea, under one name, the more precise and determinate we make the signification of that word; but yet never make it thereby more capable of universal certainty, in respect of other qualities, not contained in our complex idea: since we perceive not their connexion, or dependence on one another; being ignorant both of that real constitution in which they are all founded; and also how they flow from it. For the chief part of our knowledge concerning substances is not, as in other things, barely of the relation of two ideas, that may exist separately; but is of the necessary connexion and co-existence of several distinct ideas in the same subject, or of their repugnancy so to co-exist. Could we begin at the other end, and discover what it was,

wherein that colour consisted, what made a body lighter or heavier, what texture of parts made it malleable, fusible, and fixed, and fit to be dissolved in this sort of liquor, and not in another; if (I say) we had such an idea as this of bodies, and could perceive wherein all sensible qualities originally consist, and how they are produced; we might frame such abstract ideas of them, as would furnish us with matter of more general knowledge, and enable us to make universal propositions, that should carry general truth and certainty with them. But whilst our complex ideas of the sorts of substances, are so remote from that internal real constitution on which their sensible qualities depend; and are made up of nothing but an imperfect collection of those apparent qualities our senses can discover, there can be very few general propositions concerning substances of whose real truth we can be certainly assured; since there are but few simple ideas, of whose connexion and necessary coexistence, we can have certain and undoubted knowledge. I imagine, amongst all the secondary qualities of substances, and the powers relating to them, there cannot any two be named, whose necessary co-existence, or repugnance to co-exist, can certainly be known unless in those of the same sense, which necessarily exclude one another, as I have elsewhere shown. No one, I think, by the colour that is in any body, can certainly know what smell, taste, sound, or tangible qualities it has, nor what alterations 'tis capable to make, or receive, on, or from other bodies. The same may be said of the sound or taste, etc. Our specific names of substances standing for any collections of such ideas, 'tis not to be wondered, that we can, with them, make very few general propositions of undoubted real certainty. But yet so far as any complex idea; of any sort of substances, contains in it any simple idea, whose necessary co-existence with any other may be discovered, so far universal propositions may with certainty be made concerning it: v.g. could anyone discover a necessary connexion between malleableness, and the colour or weight of gold, or any other part of the complex idea signified by that name, he might make a certain universal proposition concerning gold in this respect; and the real truth of this proposition, that 'all gold is malleable', would be as certain as of this, 'the three angles of all right-lined triangles, are equal to two right ones'.

§11. The qualities which make our complex ideas of substances, depend mostly on external, remote, and unperceived causes. Had we such ideas of substances as to know what real

constitutions produce those sensible qualities we find in them, and how those qualities flowed from thence, we could, by the specific ideas of their real essences in our own minds, more certainly find out their properties and discover what qualities they had, or had not, than we can now by our senses: and to know the properties of gold, it would be no more necessary that gold should exist, and that we should make experiments upon it, than 'tis necessary for the knowing the properties of a triangle, that a triangle should exist in any matter, the idea in our minds would serve for the one, as well as the other. But we are so far from being admitted into the secrets of nature, that we scarce so much as ever approach the first entrance towards them. For we are wont to consider the substances we meet with, each of them, as an entire thing by itself, having all its qualities in itself, and independent of other things; overlooking, for the most part, the operations of those invisible fluids, they are encompassed with; and upon whose motions and operations depend the greatest part of those qualities which are taken notice of in them, and are made by us the inherent marks of distinction, whereby we know and denominate them. Put a piece of gold anywhere by itself, separate from the reach and influence of all other bodies, it will immediately lose all its colour and weight, and perhaps malleableness too; which, for aught I know, would be changed into a perfect friability. Water, in which to us fluidity is an essential quality, left to itself, would cease to be fluid. But if inanimate bodies owe so much of their present state to other bodies without them, that they would not be what they appear to us, were those bodies that environ them removed, 'tis yet more so in vegetables, which are nourished, grow, and produce leaves, flowers, and seeds, in a constant succession. And if we look a little nearer into the state of animals, we shall find that their dependence, as to life, motion, and the most considerable qualities to be observed in them is so wholly on extrinsical causes and qualities of other bodies, that make no part of them, that they cannot subsist a moment without them: though yet those bodies on which they depend, are little taken notice of, and make no part of the complex ideas, we frame of those animals. Take the air but a minute from the greatest part of living creatures, and they presently lose sense, life, and motion. This the necessity of breathing has forced into our knowledge. But how many other extrinsical, and possibly very remote bodies, do the springs of these admirable machines depend on, which are not vulgarly observed, or so much as thought on; and how many are there, which the severest inquiry can never discover? The inhabitants of this spot of the universe,

though removed so many millions of miles from the Sun, yet depend so much on the duly tempered motion of particles coming from, or agitated by it, that were this Earth removed, but a small part of the distance, out of its present situation, and placed a little further or nearer that source of heat, 'tis more than probable that the greatest part of the animals in it, would immediately perish: since we find them so often destroyed by an excess or defect of the Sun's warmth, which an accidental position, in some parts of this our little globe, exposes them to. The qualities observed in a loadstone, must needs have their source far beyond the confines of that body; and the ravage made often on several sorts of animals, by invisible causes, the certain death (as we are told) of some of them, by barely passing the line, or, as 'tis certain of others, by being removed into a neighbouring country, evidently show, that the concurrence and operations of several bodies, with which, they are seldom thought, to have anything to do, is absolutely necessary to make them be, what they appear to us, and to preserve those qualities, by which we know and distinguish them. We are then quite out of the way, when we think, that things contain within themselves the qualities that appear to us in them: and we in vain search for that constitution within the body of a fly, or an elephant, upon which depend those qualities and powers we observe in them. For which, perhaps, to understand them aright, we ought to look, not only beyond this our Earth and atmosphere, but even beyond the Sun, or remotest star our eyes have yet discovered. For how much the being and operation of particular substances in this our globe, depend on causes utterly beyond our view, is impossible for us to determine. We see and perceive some of the motions and grosser operations of things here about us; but whence the streams come that keep all these curious machines in motion and repair, how conveyed and modified, is beyond our notice and apprehension; and the great parts and wheels, as I may, say, of this stupendous structure of the universe, may, for aught we know, have such a connexion and dependence in their influences and operations one upon another, that, perhaps, things in this our mansion would put on quite another face, and cease to be what they are, if some one of the stars, or great bodies incomprehensibly remote from us, should cease to be, or move as it does. This is certain, things, however absolute and entire they seem in themselves, are but retainers to other parts of nature, for that which they are most taken notice of by us. Their observable qualities, actions, and powers, are owing to something without them; and there is not so complete and perfect a part, that we know, of nature, which

does not owe the being it has, and the excellences of it, to its neighbours; and we must not confine our thoughts within the surface of any body, but look a great deal further, to comprehend perfectly those qualities that are in it.

§12. If this be so, 'tis not to be wondered, that we have very imperfect ideas of substances; and that the real essences, on which depend their properties and operations are unknown to us. We cannot discover so much as that size, figure, and texture of their minute and active parts, which is really in them; much less the different motions and impulses made in and upon them by bodies from without, upon which depends, and by which is formed the greatest and most remarkable part of those qualities we observe in them, and of which our complex ideas of them are made up. This consideration alone is enough to put an end to all our hopes of ever having the ideas of their real essences; which, whilst we want, the nominal essences, we make use of instead of them, will be able to furnish us but very sparingly with any general knowledge, or universal propositions capable of real certainty.

§13. Judgment may reach further, but that is not knowledge. We are not therefore to wonder, if certainty be to be found in very few general propositions made concerning substances: our knowledge of their qualities and properties go very seldom further than our senses reach and inform us. Possibly inquisitive and observing men may, by strength of judgment, penetrate further, and on probabilities taken from wary observation, and hints well laid together, often guess right at what experience has not yet discovered to them. But this is but guessing still; it amounts only to opinion, and has not that certainty, which is requisite to knowledge. For all general knowledge lies only in our own thoughts, and consists barely in the contemplation of our own abstract ideas. Wherever we perceive any agreement or disagreement amongst them, there we have general knowledge; and by putting the names of those ideas together accordingly in propositions, can with certainty pronounce general truths. But because the abstract ideas of substances, for which their specific names stand, whenever they have any distinct and determinate signification, have a discoverable connexion or inconsistency with but a very few other ideas, the certainty of universal propositions concerning substances, is very narrow and scanty in that part, which is our principal inquiry concerning them;

and there is scarce any of the names of substances, let the idea 'tis applied to be what it will, of which we can generally, and with certainty pronounce, that it has or has not this or that other quality belonging to it, and constantly coexisting or inconsistent with that idea, wherever 'tis to be found.

§14. What is requisite for our knowledge of substances. Before we can have any tolerable knowledge of this kind, we must First know what changes the primary qualities of one body, do regularly produce in the primary qualities of another, and how. Secondly, we must know what primary qualities of any body, produce certain sensations or ideas in us. This is in truth, no less than to know all the effects of matter, under its divers modifications of bulk, figure, cohesion of parts, motion, and rest. Which, I think, everybody will allow, is utterly impossible to be known by us, without revelation. Nor if it were revealed to us, what sort of figure, bulk, and motion of corpuscles, would produce in us the sensation of a yellow colour, and what sort of figure, bulk, and texture of parts in the superficies of any body, were fit to give such corpuscles their due motion to produce that colour, would that be enough to make universal propositions with certainty, concerning the several sorts of them, unless we had faculties acute enough to perceive the precise bulk, figure, texture, and motion of bodies in those minute parts, by which they operate on our senses, that so we might by those frame our abstract ideas of them. I have mentioned here only corporeal substances, whose operations seem to lie more level to our understandings: for as to the operations of spirits, both their thinking and moving of bodies, we at first sight find ourselves at a loss; though perhaps, when we have applied our thoughts a little nearer to the consideration of bodies, and their operations, and examined how far our notions, even in these, reach with any clearness, beyond sensible matter of fact, we shall be bound to confess, that even in these too, our discoveries amount to very little beyond perfect ignorance and incapacity.

§15. Whilst our ideas of substances contain not their real constitutions, we can make but few general propositions concerning them. This is evident, the abstract complex ideas of substances, for which their general names stand, not comprehending their real constitutions, can afford us but very little universal certainty. Because our ideas of them are not made up of that, on which those qualities we observe in them, and would inform ourselves about, do depend, or

with which they have any certain connexion. V.g. Let the idea to which we give the name man, be, as it commonly is, a body of the ordinary shape, with sense, voluntary motion, and reason joined to it. This being the abstract idea, and consequently the essence of our species man, we can make but very few general certain propositions concerning man, standing for such an idea. Because not knowing the real constitution on which sensation, power of motion, and reasoning, with that peculiar shape, depend, and whereby they are united together in the same subject, there are very few other qualities, with which we can perceive them to have a necessary connexion: and therefore we cannot with certainty affirm, that ‘all men sleep by intervals’; That ‘no man can be nourished by wood or stones; That all men will be poisoned by hemlock’: because these ideas have no connexion nor repugnancy with this our nominal essence of man, with this abstract idea that name stands for. We must in these and the like appeal to trial in particular subjects, which can reach but a little way. We must content ourselves with probability in the rest: but can have no general certainty, whilst our specific idea of man, contains not that real constitution, which is the root, wherein all his inseparable qualities are united, and from whence they flow. Whilst our idea, the word man stands for, is only an imperfect collection of some sensible qualities and powers in him, there is no discernible connexion or repugnance between our specific idea, and the operation of either the parts of hemlock or stones, upon his constitution. There are animals that safely eat hemlock, and others that are nourished by wood and stones: but as long as we want ideas of those real constitutions of different sorts of animals, whereon these, and the like qualities and powers depend, we must not hope to reach certainty in universal propositions concerning them. Those few ideas only, which have a discernible connexion with our nominal essence, or any part of it, can afford us such propositions. But these are so few, and of so little moment, that we may justly look on our certain general knowledge of substances, as almost none at all.

§16. Wherein lies the general certainty of propositions. To conclude, general propositions, of what kind soever, are then only capable of certainty, when the terms used in them stand for such ideas, whose agreement or disagreement, as there expressed, is capable to be discovered by us. And we are then certain of their truth or falsehood, when we perceive the ideas the terms stand for, to agree or not agree, according as they are affirmed or denied one of another.

Whence we may take notice, that general certainty is never to be found but in our ideas. Whenever we go to seek it elsewhere in experiment or observations without us, our knowledge goes not beyond particulars."Tis the contemplation of our own abstract ideas, that alone is able to afford us general knowledge.

Chapter VII Of Maxims

§1. They are self-evident. There are a sort of propositions, which under the name of maxims and axioms, have passed for principles of science: and because they are self-evident, have been supposed innate, without that anybody (that I know) ever went about to show the reason and foundation of their clearness or cogency. It may, however, be worth while to inquire into the reason of their evidence, and see whether it be peculiar to them alone; and also to examine how far they influence and govern our other knowledge.

§2. Wherein that self-evidence consists. Knowledge, as has been shown, consists in the perception of the agreement or disagreement of ideas. Now, where that agreement or disagreement is perceived immediately by itself, without the intervention or help of any other, there our knowledge is self-evident. This will appear to be so to anyone who will but consider any of those propositions which, without any proof, he assents to at first sight: for in all of them he will find that the reason of his assent is from that agreement or disagreement, which the mind, by an immediate comparing them, finds in those ideas answering the affirmation or negation in the proposition.

§3. Self-evidence not peculiar to received axioms. This being so, in the next place let us consider, whether this self-evidence be peculiar only to those propositions, which commonly pass under the name of maxims, and have the dignity of axioms allowed them. And here 'tis plain, that several other truths, not allowed to be axioms, partake equally with them in this self-evidence. This we shall see, if we go over these several sorts of agreement or disagreement of ideas which I have above mentioned, viz. identity, relation, coexistence, and real existence; which will discover to us, that not only those few propositions which have had the credit of maxims, are self-evident, but a great many, even almost an infinite number of other propositions are such.

§4. First, as to identity and diversity, all propositions are equally selfevident. For, First, The immediate perception of the agreement or disagreement of identity being founded in the mind's having distinct ideas, this affords us as many self-evident propositions as we have distinct ideas. Everyone that has any knowledge at all, has, as the foundation of it, various and distinct ideas: and 'tis the first act of the mind, (without which, it can never be capable of any knowledge,) to know every one of its ideas by itself, and distinguish it from others. Every one finds in himself, that he knows the ideas he has; that he knows also, when any one is in his understanding, and what it is; and that when more than one are there, he knows them distinctly and unconfusedly one from another; Which always being so, (it being impossible but that he should perceive what he perceives,) he can never be in doubt when any idea is in his mind, that 'tis there, and is that idea it is; and that two distinct ideas, when they are in his mind, are there, and are not one and the same idea. So that all such affirmations and negations are made without any possibility of doubt, uncertainty, or hesitation, and must necessarily be assented to, as soon as understood; that is, as soon as we have, in our minds, determined ideas, which the terms in the proposition stand for. And therefore, whenever the mind with attention considers any proposition, so as to perceive the two ideas, signified by the terms and affirmed or denied one of the other, to be the same or different; 'tis presently and infallibly certain of the truth of such a proposition; and this equally whether these propositions be in terms standing for more general ideas or such as are less so, v.g. whether the general idea of being be affirmed of itself, as in this proposition, 'whatsoever is, is'; or a more particular idea be affirmed of itself, as 'a man is a man'; or, 'whatsoever is white is white'; or whether the idea of being in general be denied of not being, which is the only (if I may so call it) idea different from it, as in this other proposition, 'tis impossible for the same thing to be and not to be': or any idea of any particular being be denied of another different from it, as 'a man is not a horse'; 'red is not blue.' The difference of the ideas as soon as the terms are understood, makes the truth of the proposition presently visible, and that with an equal certainty and easiness in the less as well as the more general propositions; and all for the same reason, viz. because the mind perceives in any ideas, that it has the same idea to be the same with itself; and two different ideas to be different and not the same. And this 'tis equally certain of, whether these ideas be more or less general, abstract, and comprehensive. 'Tis not therefore alone to

these two general propositions, 'whatsoever is, is'; and 'tis impossible for the same thing to be, and not to be'; that this sort of selfevidence belongs by any peculiar right. The perception of being, or not being, belongs no more to these vague ideas, signified by the terms whatsoever, and thing, than it does to any other ideas. These two general maxims, amounting to no more, in short but this, that the same is the same, and 'same is not different', are truths known in more particular instances, as well as in those general maxims, and known also in particular instances, before these general maxims are ever thought on, and draw all their force from the discernment of the mind employed about particular ideas. There is nothing more visible than that the mind, without the help of any proof, or reflection on either of these general propositions perceives so clearly, and knows so certainly, that the idea of white, is the idea of white, and not the idea of blue; and that the idea of white, when 'tis in the mind, is there, and is not absent, that the consideration of these axioms can add nothing to the evidence or certainty of its knowledge. Just so 'tis (as every one may experiment in himself) in all the ideas a man has in his mind: he knows each to be itself, and not to be another; and to be in his mind, and not away when 'tis there, with a certainty that cannot be greater, and therefore the truth of no general proposition can be known with a greater certainty, nor add anything to this. So that in respect of identity, our intuitive knowledge reaches as far as our ideas. And we are capable of making as many selfevident propositions, as we have names for distinct ideas. And I appeal to every one's own mind, whether this proposition, 'a circle is a circle,' be not as selfevident a proposition as that consisting of more general terms, 'whatsoever is, is'; and again, whether this proposition, 'blue is not red,' be not a proposition that the mind can no more doubt of, as soon as it understands the words, than it does of that axiom, 'tis impossible for the same thing to be, and not to be' And so of all the like.

§5. Secondly, in co-existence we have few selfevident propositions. Secondly, as to co-existence, or such a necessary connexion between two ideas, that in the subject where one of them is supposed, there the other must necessarily be also: of such agreement, or disagreement as this, the mind has an immediate perception, but in very few of them. And therefore in this sort, we have but very little intuitive knowledge: nor are there to be found very many propositions that are selfevident, though some there are: v.g. the idea of filling a place equal to the contents of its superficies, being annexed to our

idea of body, I think 'tis a selfevident proposition, 'that two bodies cannot be in the same place'.

§6. Thirdly, in other relations we may have. Thirdly, as to the relations of modes, mathematicians have framed many axioms concerning that one relation of equality. As, 'equals taken from equals, the remainder will be equal'; which, with the rest of that kind, however they are received for maxims by the mathematicians, and are unquestionable truths, yet, I think, that anyone who considers them will not find, that they have a clearer selfevidence than these, that 'one and one, are equal to two'; that 'if you take from the five fingers of one hand two, and from the five fingers of the other hand two, the remaining numbers will be equal.' These, and a thousand other such propositions, may be found in numbers, which at the very first hearing, force the assent, and carry with them an equal, if not greater clearness, than those mathematical axioms.

§7. Fourthly, concerning real existence we have none. Fourthly, as to real existence, since that has no connexion with any other of our ideas, but that of ourselves, and of a First being, we have in that, concerning the real existence of all other beings, not so much as demonstrative, much less a selfevident knowledge: and therefore concerning those there are no maxims.

§8. These axioms do not much influence our other knowledge. In the next place let us consider, what influence these received maxims have, upon the other parts of our knowledge. The rules established in the schools, that all reasonings are *ex praeognitis, et praeconcessis*, seem to lay the foundation of all other knowledge, in these maxims, and to suppose them to be *praeognita*; Whereby, I think, are meant these two things: first, that these axioms. are those truths that are first known to the mind; and, secondly, that upon them the other parts of our knowledge depend.

§9. Because they are not the truths we first knew. First, That they are not the truths first known to the mind, is evident to experience, as we have shown in another place. B. I. Ch. II. Who perceives not, that a child certainly knows, that a stranger is not its mother; that its suckingbottle is not the rod, long before he knows that "tis impossible for the same thing to be and not to be" And how many truths are there about numbers, which 'tis obvious to observe, that the mind is perfectly acquainted with, and fully convinced of, before it ever

thought on these general maxims, to which mathematicians, in their arguings, do sometimes refer them' Whereof the reason is very plain: for that which makes the mind assent to such propositions, being nothing else but the perception it has of the agreement, or disagreement of its ideas, according as it finds them affirmed or denied one of another, in words it understands; and every idea being known to be what it is, and every two distinct ideas being known not to be the same it must necessarily follow, that such selfevident truths, must be first known, which consist of ideas that are first in the mind: and the ideas first in the mind, 'tis evident, are those of particular things, from whence, by slow degrees, the understanding proceeds to some few general ones; which being taken from the ordinary and familiar objects of sense, are settled in the mind, with general names to them. Thus particular ideas are first received and distinguished, and so knowledge got about them: and next to them, the less general, or specific, which are next to particular. For abstract ideas are not so obvious or easy to children, or the yet unexercised mind, as particular ones. If they seem so to grown men, 'tis only because by constant and familiar use they are made so. For, when we nicely reflect upon them, we shall find, that general ideas are fictions and contrivances of the mind, that carry difficulty with them, and do not so easily offer themselves, as we are apt to imagine. For example, does it not require some pains and skill to form the general idea of a triangle, (which is yet none of the most abstract, comprehensive, and difficult,) for it must be neither oblique, nor rectangle, neither equilateral, equicrural, nor scalenon; but all and none of these at once. In effect, 'tis something imperfect, that cannot exist; an idea wherein some parts of several different and inconsistent ideas are put together. 'Tis true, the mind, in this imperfect state, has need of such ideas, and makes all the haste to them it can, for the conveniency of communication, and enlargement of knowledge; to both which, 'tis naturally very much inclined. But yet one has reason to suspect such ideas are marks of our imperfection; at least, this is enough to show, that the most abstract and general ideas, are not those that the mind is first and most easily acquainted with, nor such as its earliest knowledge is conversant about.

§10. Because on them the other parts of our knowledge do not depend. Secondly, from what has been said it plainly follows, that these magnified maxims, are not the principles and foundations of all our other knowledge. For if there be a great many other truths, which

have as much selfevidence as they, and a great many that we know before them, 'tis impossible they should be the principles, from which we deduce all other truths. Is it impossible to know that one and two are equal to three, but by virtue of this, or some such axiom, viz. 'the whole is equal to all its parts taken together' Many a one knows that one and two are equal to three, without having heard, or thought on that, or any other axiom, by which it might be proved; and knows it as certainly, as any other man knows, that 'the whole is equal to all its parts,' or any other maxim; and all from the same reason of selfevidence: the equality of those ideas being as visible and certain to him, without that or any other axiom, as with it, it needing no proof to make it perceived. Nor after the knowledge, 'that the whole is equal to all its parts', does he know 'that one and two are equal to three', better or more certainly than he did before. For if there be any odds in those ideas, the whole and parts are more obscure, or at least more difficult to be settled in the mind than those of one, two, and three. And indeed, I think, I may ask these men, who will needs have all knowledge besides those general principles themselves, to depend on general, innate, and self-evident principles, What principle is requisite to prove, that one and one are two, that two and two are four, that three times two are six' Which being known without any proof, do evince, That either all knowledge does not depend on certain praecognita or general maxims, called principles; or else that these are principles: and if these are to be counted principles, a great part of numeration will be so. To which if we add all the selfevident propositions, which may be made about all our distinct ideas, principles will be almost infinite, at least innumerable, which men arrive to the knowledge of, at different ages; and a great many of these innate principles, they never come to know all their lives. But whether they come in view of the mind, earlier, or later, this is true of them, that they are all known by their native evidence, are wholly independent, receive no light, nor are capable of any proof one from another; much less the more particular, from the more general or the more simple, from the more compounded the more simple, and less abstract being the most familiar, and the easier and earlier apprehended. But whichever be the clearest ideas, the evidence and certainty of all such propositions is in this, That a man sees the same idea to be the same idea, and infallibly perceives two different ideas to be different ideas. For when a man has in his understanding, the ideas of one and of two, the idea of yellow and the idea of blue, he cannot but certainly know, that the idea of one is the idea of one, and

not the idea of two; and that the idea of yellow is the idea of yellow, and not the idea of blue. For a man cannot confound the ideas in his mind, which he has distinct: that would be to have them confused and distinct at the same time, which is a contradiction: and to have none distinct, is to have no use of our faculties, to have no knowledge at all. And therefore what idea soever is affirmed of itself; or whatsoever two entire distinct ideas are denied one of another, the mind cannot but assent to such a proposition, as infallibly true, as soon as it understands the terms, without hesitation or need of proof, or regarding those made in more general terms, and called maxims.

§11. What use these general maxims have. What shall we then say. Are these general maxims of no use? By no means, though perhaps their use is not that, which 'tis commonly taken to be. But since doubting in the least of what hath been by some men ascribed to these maxims may be apt to be cried out against, as overturning the foundations of all the sciences; it may be worthwhile to consider them, with respect to other parts of our knowledge, and examine more particularly to what purposes they serve, and to what not.

1. 'Tis evident from what has been already said, that they are of no use to prove or confirm less general selfevident propositions.

2. 'Tis as plain that they are not, nor have been the foundations whereon any science hath been built. There is, I know, a great deal of talk, propagated from scholastic men, of sciences and the maxims on which they are built: but it has been my ill luck, never to meet with any such sciences; much less any one built upon these two maxims, 'what is', is; and 'tis impossible for the same to be and not to be'. And I would be glad to be shown where any such science erected upon these, or any other general axioms is to be found: and should be obliged to anyone who would lay before me the frame and system of any science so built on these, or any such like maxims, that could not be shown to stand as firm without any consideration of them. I ask, Whether these general maxims have not the same use in the study of divinity, and in theological questions, that they have in other sciences? They serve here, too, to silence wranglers, and put an end to dispute. But I think that nobody will therefore say, that the Christian religion is built on these maxims, or that the knowledge we have of 'tis, derived from these principals. 'Tis from revelation we have received it, and without revelation these maxims had never been able to help us

to it. When we find out an idea, by whose intervention we discover the connexion of two others, this is a revelation from God to us, by the voice of reason. For we then come to know a truth that we did not know before. When God declares any truth to us, this is a revelation to us by the voice of his Spirit, and we are advanced in our knowledge. But in neither of these do we receive our light or knowledge from maxims. But in the one the things themselves afford it, and we see the truth in them by perceiving their agreement or disagreement. In the other, God himself affords it immediately to us, and we see the truth of what he says in his unerring veracity.

3. They are not of use to help men forward in the advancement of sciences, or new discoveries of yet unknown truths. Mr. Newton, in his never enough to be admired book, has demonstrated several propositions, which are so many new truths, before unknown to the world, and are further advances in mathematical knowledge: but for the discovery of these, it was not the general maxims, 'what is, is;' or, 'the whole is bigger than a part,' or the like, that helped him. These were not the clues that led him into the discovery of the truth and certainty of those propositions. Nor was it by them that he got the knowledge of those demonstrations; but by finding out intermediate ideas, that showed the agreement or disagreement of the ideas, as expressed in the propositions he demonstrated. This is the great exercise and improvement of human understanding in the enlarging of knowledge, and advancing the sciences; wherein they are far enough from receiving any help from the contemplation of these, or the like magnified maxims. Would those who have this traditional admiration of these propositions, that they think no step can be made in knowledge without the support of an axiom, no stone laid in the building of the sciences without a general maxim, but distinguish between the method of acquiring knowledge, and of communicating, between the method of raising any science, and that of teaching it to others as far as 'tis advanced, they would see that those general maxims were not the foundations on which the first discoverers raised their admirable structures, not the keys that unlocked and opened those secrets of knowledge. Though afterwards, when schools were erected, and sciences had their professors to teach what others had found out, they often made use of maxims, i.e. laid down certain propositions which were selfevident, or to be received for true, which being settled in the minds of their scholars as unquestionable verities, they on occasion made use of, to convince

them of truths in particular instances, that were not so familiar to their minds as those general axioms which had before been inculcated to them, and carefully settled in their minds. Though these particular instances, when well reflected on, are no less self-evident to the understanding than the general maxims brought to confirm them: and it was in those particular instances, that the first discoverer found the truth, without the help of the general maxims: and so may any one else do, who with attention considers them.

To come, therefore, to the use that is made of maxims.

1. They are of use, as has been observed, in the ordinary methods of teaching sciences as far as they are advanced: but of little or none in advancing them further.

2. They are of use in disputes, for the silencing of obstinate wranglers, and bringing those contests to some conclusion. Whether a need of them to that end, came not in, in the manner following, I crave leave to inquire. The Schools having made disputation the touchstone of men's abilities, and the criterion of knowledge, adjudged victory to him that kept the field: and he that had the last word was concluded to have the better of the argument, if not of the cause. But because by this means there was like to be no decision between skilful combatants, whilst one never failed of a *medius terminus* to prove any proposition; and the other could as constantly, without, or with a distinction, deny the major or minor, to prevent, as much as could be, the running out of disputes into an endless train of syllogisms, certain general propositions, most of them indeed self-evident, were introduced into the Schools, which being such as all men allowed and agreed in, were looked on as general measures of truth, and served instead of principles, (where the disputants had not laid down any other between them) beyond which there was no going, and which must not be receded from by either side. And thus these maxims getting the name of principles, beyond which men in dispute could not retreat, were by mistake taken to be the originals and sources, from whence all knowledge began, and the foundations whereon the sciences were built. Because when in their disputes they came to any of these, they stopped there, and went no further, the matter was determined. But how much this is a mistake hath been already shown.

This method of the Schools, which have been thought the fountains of knowledge, introduced, as I suppose the like use of these

maxims, into a great part of conversation out of the Schools, to stop the mouths of cavillers, whom anyone is excused from arguing any longer with, when they deny these general selfevident principles received by all reasonable men, who have once thought of them: but yet their use herein, is but to put an end to wrangling. They in truth, when urged in such cases, teach nothing: that is already done by the intermediate ideas made use of in the debate, whose connexion may be seen without the help of those maxims, and so the truth known before the maxim is produced, and the argument brought to a first principle. Men would give off a wrong argument before it came to that, if in their disputes they proposed to themselves the finding and embracing of truth, and not a contest for victory. And thus maxims have their use to put a stop to their perverseness, whose ingenuity should have yielded sooner. But the method of the Schools, having allowed and encouraged men to oppose and resist evident truth, till they are baffled, i.e. till they are reduced to contradict themselves, or some established principles; 'tis no wonder that they should not in civil conversation be ashamed of that, which in the Schools is counted a virtue and a glory, viz. obstinately to maintain that side of the question they have chosen, whether true or false, to the last extremity; even after conviction. A strange way to attain truth and knowledge: and that which I think the rational part of mankind not corrupted by education, could scarce believe should ever be admitted amongst the lovers of truth, and students of religion or nature; or introduced into the seminaries of those who are to propagate the truths of religion or philosophy, amongst the ignorant and unconvinced. How much such a way of learning is like to turn young men's minds from the sincere search and love of truth; nay, and to make them doubt whether there is any such thing, or at least worth the adhering to, I shall not now inquire. This I think, that bating those places, which brought the Peripatetick Philosophy into their schools, where it continued many ages, without teaching the world anything but the art of wrangling; these maxims were nowhere thought the foundations on which the sciences were built, nor the great helps to the advancement of knowledge.

What use these general maxims have. As to these general maxims therefore, they are as I have said of great use in disputes, to stop the mouths of wranglers; but not of much use to the discovery of unknown truths, or to help the mind forwards, in its search after knowledge. For whoever began to build his knowledge on the general

proposition, 'what is, is'; or, 'tis impossible for the same thing to be and not to be': and from either of these, as from a principle of science, deduced a system of useful knowledge' Wrong opinions often involving contradictions, one of these maxims, as a touchstone, may serve well to show whither they lead. But yet, however fit, to lay open the absurdity or mistake of a man's reasoning or opinion, they are of very little use for enlightening the understanding: and it will not be found, that the mind receives much help from them in its progress in knowledge; which would be neither less, nor less certain, were these two general propositions never thought on. 'Tis true, as I have said, they sometimes serve in argumentation to stop a wrangler's mouth, by showing the absurdity of what he saith, and by exposing him to the shame of contradicting what all the world knows, and he himself cannot but own to be true. But 'tis one thing, to show a man that he is in an error; and another, to put him in possession of truth: and I would fain know what truths these two propositions are able to teach, and by their influence make us know, which we did not know before, or could not know without them. Let us reason from them, as well as we can, they are only about identical predications, and influence, if any at all, none but such. Each particular proposition concerning identity or diversity, is as clearly and certainly known in itself, if attended to, as either of these general ones: only these general ones, as serving in all cases, are therefore more inculcated and insisted on. As to other less general maxims, many of them are no more than bare verbal propositions, and teach us nothing but the respect and import of names one to another. 'The whole is equal to all its parts': what real truth, I beseech you, does it teach us? What more is contained in that maxim, than what the signification of the word totum, or the whole, does of itself import? And he that knows that the word whole, stands for what is made up of all its parts, knows very little less than that the whole is equal to all its parts. And upon the same ground, I think that this proposition, 'a hill is higher than a valley,' and several the like, may also pass for maxims. But yet masters of mathematics, when they would, as teachers of what they know, initiate others in that science, do not without reason place this, and some other such maxims, at the entrance of their systems; that their scholars, having in the beginning perfectly acquainted their thoughts with these propositions, made in such general terms, may be used to make such reflections, and have these more general propositions, as formed rules and sayings, ready to apply to all particular cases. Not that if they be equally weighed, they are more clear and evident than the particular instances they are

brought to confirm; but that being more familiar to the mind, the very naming them, is enough to satisfy the understanding. But this, I say, is more from our custom of using them, and the establishment they have got in our minds, by our often thinking of them, than from the different evidence of the things. But before custom has settled methods of thinking and reasoning in our minds, I am apt to imagine 'tis quite otherwise; and that the child, when a part of his apple is taken away, knows it better in that particular instance, than by this general proposition, 'the whole is equal to all its parts'; and that, if one of these have need to be confirmed to him by the other, the general has more need to be let into his mind by the particular, than the particular by the general. For in particulars, our knowledge begins, and so spreads itself, by degrees, to generals. Though afterwards, the mind takes the quite contrary course, and having drawn its knowledge into as general propositions as it can, makes those familiar to its thoughts, and accustoms itself to have recourse to them, as to the standards of truth and falsehood. By which familiar use of them, as rules to measure the truth of other propositions, it comes in time to be thought, that more particular propositions have their truth and evidence from their conformity to these more general ones, which in discourse and argumentation, are so frequently urged, and constantly admitted. And this, I think, to be the reason why amongst so many selfevident propositions, the most general only have had the title of maxims.

§12. Maxims, if care be not taken in the use of words, may prove contradictions. One thing further, I think, it may not be amiss to observe concerning these general maxims, That they are so far from improving or establishing our minds in true knowledge, that if our notions be wrong, loose, or unsteady, and we resign up our thoughts to the sound of words, rather than fix them on settled determined ideas of things; I say, these general maxims will serve to confirm us in mistakes; and in such a way of use of words, which is most common, will serve to prove contradictions: v.g. he that with Descartes, shall frame in his mind an idea of what he calls body, to be nothing but extension, may easily demonstrate, that there is no vacuum, i.e. no space void of body, by this maxim, What is, is. For the idea to which he annexes the name body, being bare extension, his knowledge, that space cannot be without body, is certain. For he knows his own idea of extension clearly and distinctly, and knows that 'tis what it is, and not another idea, though it be called by these three

names, extension, body, space. Which three words, standing for one and the same idea, may, no doubt, with the same evidence and certainty, be affirmed one of another, as each of itself: and 'tis as certain, that whilst I use them all to stand for one and the same idea, this predication is as true and identical in its signification, that space is body, as this predication is true and identical, that body is body, both in signification and sound.

§13. Instance in vacuum. But if another should come and make to himself another idea, different from Descartes's, of the thing, which yet, with Descartes he calls by the same name body, and make his idea, which he expresses by the word body, to be of a thing that hath both extension and solidity together; he will as easily demonstrate, that there may be a vacuum or space without a body, as Descartes demonstrated the contrary. Because the idea to which he gives the name space, being barely the simple one of extension, and the idea, to which he gives the name body, being the complex idea of extension and resistibility, or solidity, together in the same subject, these two ideas are not exactly one and the same, but in the understanding as distinct as the ideas of one and two, white and black, or as of corporeity and humanity, if I may use those barbarous terms: and therefore the predication of them in our minds, or in words standing for them is not identical, but the negation of them one of another; viz. this proposition: 'Extension or space is not body,' is as true and evidently certain as this maxim, 'Tis impossible for the same thing to be, and not to be'; can make any proposition.

§14. They prove not the existence of things without us. But yet though both these propositions (as you see) may be equally demonstrated, viz. that there may be a vacuum, and that there cannot be a vacuum, by these two certain principles, viz. 'what is, is,' and 'the same thing cannot be, and not be': yet neither of these principles will serve to prove to us, that any, or what bodies do exist: for that we are left to our senses, to discover to us as far as they can. Those universal and selfevident principles, being only our constant, clear, and distinct knowledge of our own ideas, more general or comprehensive, can assure us of nothing that passes without the mind, their certainty is founded only upon the knowledge we have of each idea by itself, and of its distinction from others; about which, we cannot be mistaken whilst they are in our minds. though we may, and often are mistaken, when we retain the names without the ideas; or use them confusedly

sometimes for one, and sometimes for another idea. In which cases, the force of these axioms reaching only to the sound, and not the signification of the words, serves only to lead us into confusion, mistake, and error. 'Tis to show men, that these maxims, however cried up for the great guards of truth, will not secure them from error in a careless loose use of their words, that I have made this remark. In all that is here suggested concerning their little use for the improvement of knowledge, or dangerous use in undetermined ideas, I have been far enough from saying or intending they should be laid aside, as some have been too forward to charge me. I affirm them to be truths, selfevident truths; and so cannot be laid aside. As far as their influence will reach, 'tis in vain to endeavour, nor would I attempt to abridge it. But yet, without any injury to truth or knowledge, I may have reason to think their use is not answerable to the great stress which seems to be laid on them, and I may warn men not to make an ill use of them, for the confirming themselves in errors.

§15. Their application dangerous about complex ideas. But let them be of what use they will in verbal propositions, they cannot discover or prove to us the least knowledge of the nature of substances, as they are found and exist without us, any further than grounded on experience. And though the consequence of these two propositions, called principles, be very clear, and their use not dangerous, or hurtful, in the probation of such things wherein there is no need at all of them for proof, but such as are clear by themselves without them, viz. where our ideas are determined, and known by the names that stand for them: yet when these principles, viz. 'what is, is'; and 'tis impossible for the same thing to be, and not to be', are made use of in the probation of propositions, wherein are words standing for complex ideas, v.g. man, horse, gold, virtue; there they are of infinite danger, and most commonly make men receive and retain falsehood for manifest truth, and uncertainty for demonstration: upon which follow error, obstinacy, and all the mischiefs that can happen for wrong reasoning. The reason whereof is not, that these principles are less true, or of less force in proving propositions made of terms standing for complex ideas, than where the propositions are about simple ideas. But because men mistake generally, thinking that where the same terms are preserved, the propositions are about the same things, though the ideas they stand for are in truth different. Therefore these maxims are made use of to support those, which in sound and

appearance are contradictory propositions; and is clear in the demonstrations above-mentioned about a vacuum. So that whilst men take words for things, as usually they do, these maxims may and do commonly serve to prove contradictory propositions. As shall yet be further made manifest.

§16. Instance in man. For instance: let man be that, concerning which you would by these first principles demonstrate anything, and we shall see, that so far as demonstration is by these principles, 'tis only verbal, and gives us no certain universal true proposition, or knowledge of any being existing without us. First, a child having framed the idea of a man, 'tis probable, that his idea is just like that picture, which the painter makes of the visible appearances joined together; and such a complication of ideas together in his understanding, makes up the single complex idea which he calls man, whereof white or fleshcolour in England being one, the child can demonstrate to you that 'a negro is not a man', because white colour was one of the constant simple ideas of the complex idea he calls man: and therefore he can demonstrate by the principle, "Tis impossible for the same thing to be, and not to be", that 'a negro is not a man'; the foundation of his certainty being not that universal proposition, which perhaps, he never heard nor thought of, but the clear distinct perception he hath of his own simple ideas of black and white, which he cannot be persuaded to take, nor can ever mistake one for another, whether he knows that maxim or no: and to this child, or anyone who hath such an idea, which he calls man, can you never demonstrate that a man hath a soul, because his idea of man includes no such notion or idea in it. And therefore, to him, the principle of 'what is, is', proves not this matter; but it depends upon collection and observation, by which he is to make his complex idea called man.

§17. Secondly, another that hath gone further in framing and collecting the idea he calls man, and to the outward shape adds laughter, and rational discourse, may demonstrate, that infants and changelings are no men, by this maxim, "tis impossible for the same thing to be, and not to be": and I have discoursed with very rational men, who have actually denied that they are men.

§18. Thirdly, Perhaps, another makes up the complex idea which he calls man, only out of the ideas of body in general, and the powers of language and reason, and leaves out the shape wholly: this man is

able to demonstrate, that a man may have no hands, but be quadrupes, neither of those being included in his idea of man; and in whatever body or shape he found speech and reason joined, that was a man; because having a clear knowledge of such a complex idea, 'tis certain that 'What is, is'.

§19. Little use of these maxims in proofs where we have clear and distinct ideas. So that, if rightly considered, I think we may say, that where our ideas are determined in our minds, and have annexed to them by us known and steady names under those settled determinations, there is little need, or no use at all of these maxims, to prove the agreement, or disagreement of any of them. He that cannot discern the truth or falsehood of such propositions, without the help of these, and the like maxims, will not be helped by these maxims to do it: since he cannot be supposed to know the truth of these maxims themselves without proof, if he cannot know the truth of others without proof, which are as self-evident as these. Upon this ground 'tis, that intuitive knowledge neither requires, nor admits any proof, one part of it more than another. He that will suppose it does, takes away the foundation of all knowledge, and certainty: and he that needs any proof to make him certain, and give his assent to this proposition, that 'two are equal to two', will also have need of a proof to make him admit, that 'what is, is'. He that needs a probation to convince him, that 'two are not three', that 'white is not black', that 'a triangle is not a circle', etc. or any other two determined distinct ideas are not one and the same, will need also a demonstration to convince him that 'Tis 'impossible for the same thing to be and not to be'.

§20. Their use dangerous where our ideas are confused. And as these maxims are of little use where we have determined ideas, so they are, as I have shown, of dangerous use, where our ideas are not determined; and where we use words that are not annexed to determined ideas, but such as are of a loose and wandering signification sometimes standing for one, and sometimes for another idea; from which follow mistake and error, which these maxims (brought as proofs to establish propositions, wherein the terms stand for undetermined ideas) do by their authority confirm and rivet.

Chapter VIII Of Trifling Propositions

§1. Some propositions bring no increase to our knowledge.

Whether the maxims treated of in the foregoing chapter be of that use to real knowledge, as is generally supposed, I leave to be considered. This, I think, may confidently be affirmed, that there are universal propositions; that, though they be certainly true, yet they add no light to our understanding, bring no increase to our knowledge. Such are,

§2. As first, identical propositions. First, all purely identical propositions. These obviously, and at first blush, appear to contain no instruction in them. For when we affirm the said term of itself, whether it be barely verbal, or whether it contains any clear and real idea, it shows us nothing, but what we must certainly know before, whether such a proposition be either made by, or proposed to us. Indeed, that most general one, 'what is, is', may serve sometimes to show a man the absurdity he is guilty of, when by circumlocution or equivocal terms, he would, in particular instances, deny the same thing of itself; because nobody will so openly bid defiance to common sense, as to affirm visible and direct contradictions in plain words: or if he does, a man is excused if he breaks off any further discourse with him. But yet, I think, I may say, that neither that received maxim, nor any other identical proposition teaches us anything: and though in such kind of propositions, this great and magnified maxim, boasted to be the foundation of demonstration, may be, and often is made use of to confirm them, yet all it proves, amounts to no more than this, That the same word may with great certainty be affirmed of itself, without any doubt of the truth of any such proposition; and let me add also, without any real knowledge.

§3. For at this rate, any very ignorant person, who can but make a proposition, and knows what he means when he says, Ay, or No, may make a million of propositions, of whose truth he may be infallibly certain, and yet not know one thing in the world thereby; v.g. what is a soul, is a soul; or a soul is a soul; a spirit is a spirit; a fetiche is a fetiche, etc. These all being equivalent to this proposition, viz. 'what is, is', i.e. 'what hath existence, hath existence'; or, 'who hath a soul, hath a soul'. What is this more than trifling with words? 'Tis but like a monkey shifting his oyster from one hand to the other; and had he but words, might, no doubt, have said, oyster in right hand is subject, and oyster in left hand is predicate. and so might have made a selfevident proposition of oyster, i.e. 'oyster is oyster'; and yet, with all this, not have been one whit the wiser or more knowing: and that way of

handling the matter, would much at once have satisfied the monkey's hunger, or a man's understanding and they would have improved in knowledge and bulk together.

I know there are some, who because identical propositions are self-evident, show a great concern for them, and think they do great service to philosophy by crying them up, as if in them was contained all knowledge, and the understanding were led into all truth by them only. I grant as forwardly as anyone, that they are all true, and self-evident. I grant further, that the foundation of all our knowledge lies in the faculty we have of perceiving the same idea to be the same, and of discerning it, from those that are different as I have shown in the foregoing chapter. But how that vindicates the making use of identical propositions, for the improvement of knowledge, from the imputation of trifling, I do not see. Let any one repeat, as often as he pleases, that 'the will is the will,' or lay what stress on it he thinks fit; of what use is this, and an infinite the like propositions, for the enlarging our knowledge? Let a man abound as much as the plenty of words, which he has, will permit him in such propositions as these. 'A law is a law,' and 'obligation is obligation'; 'right is right,' and 'wrong is wrong', will these and the like ever help him to an acquaintance with ethics? or instruct him or others, in the knowledge of morality? Those who know not, nor perhaps ever will know, what is right, and what is wrong, nor the measures of them, can with as much assurance make, and infallibly know, the truth of these and all such propositions, as he that is best instructed in morality, can do. But what advance do such propositions give in the knowledge of anything necessary, or useful for their conduct?

He would be thought to do little less than trifle, who for the enlightening the understanding in any part of knowledge, should be busy with identical propositions, and insist on such maxims as these: 'substance is substance,' and 'body is body'; 'a vacuum is a vacuum,' and 'a vortex is a vortex'; 'a centaur is a centaur,' and 'a chimera is a chimera,' etc. For these, and all such are equally true, equally certain, and equally self-evident. But yet they cannot but be counted trifling, when made use of as principles of instruction, and stress laid on them, as helps to knowledge: since they teach nothing but what everyone, who is capable of discourse, knows without being told, viz. that the same term is the same term, and the same idea the same idea. And upon this account it was that I formerly did, and do

still think, the offering and inculcating such propositions, in order to give the understanding any new light, or inlet into the knowledge of things, no better than trifling.

Instruction lies in something very different, and he that would enlarge his own, or another's mind to truths he does not yet know, must find out intermediate ideas, and then lay them in such order one by another, that the understanding may see the agreement or disagreement of those in question. Propositions that do this, are instructive: but they are far from such as affirm the same term of itself, which is no way to advance oneself or others, in any sort of knowledge. It no more helps to that, than it would help anyone in his learning to read, to have such propositions as these inculcated to him, 'An A is an A,' and 'a B is a B'; which a man may know as well as any schoolmaster, and yet never be able to read a word as long as he lives. Nor do these, or any such identical propositions help him one jot forwards in the skill of reading, let him make what use of them he can.

If those who blame my calling them trifling propositions, had but read and been at the pains to understand what I have above writ in very plain English, they could not but have seen that by identical propositions, I mean only such, wherein the same term importing the same idea, is affirmed of itself: which I take to be the proper signification of identical propositions; and concerning all such, I think I may continue safely to say, that to propose them as instructive, is no better than trifling. For no one who has the use of reason can miss them, where 'tis necessary they should be taken notice of; nor doubt of their truth, when he does take notice of them.

But if men will call propositions identical, wherein the same term is not affirmed of itself, whether they speak more properly than I, others must judge: this is certain, all that they say of propositions that are not identical, in my sense, concerns not me, nor what I have said; all that I have said relating to those propositions, wherein the same term is affirmed of itself. And I would fain see an instance, wherein any such can be made use of, to the advantage and improvement of anyone's knowledge. Instances of other kinds, whatever use may be made of them, concern not me, as not being such as I call identical.

§4. Secondly, when a part of any complex idea is predicated of the whole. Secondly, another sort of trifling propositions is, when a

part of the complex idea is predicated of the name of the whole; a part of the definition of the word defined. Such are all propositions wherein the genus is predicated of the species, or more comprehensive of less comprehensive terms. For what information, what knowledge carries this proposition in it, viz. 'Lead is a metal' to a man, who knows the complex idea the name lead stands for. All the simple ideas that go to the complex one signified by the term metal, being nothing but what he before comprehended, and signified by the name lead. Indeed, to a man that knows the signification of the word metal, and not of the word lead, 'tis a shorter way to explain the signification of the word lead, by saying 'tis a metal, which at once expresses several of its simple ideas, than to enumerate them one by one, telling him 'tis a body very heavy, fusible, and malleable.

§5. As part of the definition of the defined. A like trifling it is, to predicate any other part of the definition of the term defined, or to affirm any one of the simple ideas of a complex one of the name of the whole complex idea; as, 'all gold is fusible.' For fusibility being one of the simple ideas that goes to the making up the complex one the sound gold stands for, what can it be but playing with sounds, to affirm that of the name gold, which is comprehended in its received signification? 'Twould be thought little better than ridiculous, to affirm gravely as a truth of moment, That 'gold is yellow'; and I see not how 'tis any jot more material to say 'tis fusible', unless that quality be left out of the complex idea, of which the sound gold is the mark in ordinary speech. What instruction can it carry with it, to tell one that which he hath been told already, or he is supposed to know before? For I am supposed to know the signification of the word another uses to me, or else he is to tell me. And if I know that the name gold stands for this complex idea of body, yellow, heavy, fusible, malleable, 'twill not much instruct me to put it solemnly afterwards in a proposition, and gravely say, all gold is fusible. Such propositions can only serve to show the disingenuity of one, who will go from the definition of his own terms, by reminding him sometimes of it; but carry no knowledge with them, but of the signification of words, however certain they be.

§6. Instance man and palfrey. Every man is an animal, or living body, is as certain a proposition as can be; but no more conducing to the knowledge of things, than to say, a palfrey is an ambling horse, or a neighing ambling animal, both being only about the signification of words, and make me know but this That body, sense, and motion, or

power of sensation and moving, are three of those ideas, that I always comprehend and signify by the word man; and where they are not to be found together, the name man belongs not to that thing: and so of the other, That body, sense, and a certain way of going, with a certain kind of voice, are some of those ideas which I always comprehend, and signify by the word palfrey; and when they are not to be found together, the name palfrey belongs not to that thing. 'Tis just the same, and to the same purpose, when any term standing for any one or more of the simple ideas, that altogether make up that complex idea which is called a man, is affirmed of the term man: v.g. suppose a Roman, signified by the word homo: all these distinct ideas united in one subject, corporietas, sensibilitas, potentia se movendi, rationalitas, risibilitas, he might, no doubt, with great certainty, universally affirm one, more, or all of these together of the word homo, but did no more than say, that the word homo, in his country, comprehended in its signification, all these ideas. Much like a romance knight, who by the word palfrey, signified these ideas, body of a certain figure, fourlegged, with sense, motion, ambling, neighing, white, used to have a woman on his back, might with the same certainty, universally affirm also any, or all of these of the word palfrey: but did thereby teach no more, but that the word palfrey, in his, or Romance language, stood for all these, and was not to be applied to anything, where any of these was wanting. But he that shall tell me, that in whatever thing sense, motion, reason, and laughter, were united, that thing had actually a notion of God, or would be cast into a sleep by opium, made indeed an instructive proposition: because neither having the notion of God, nor being cast into sleep by opium, being contained in the idea signified by the word man, we are by such propositions taught something more than barely what the word man stands for: and therefore the knowledge contained in it, is more than verbal.

§7. For this teaches but the signification of words. Before a man makes any proposition, he is supposed to understand the terms he uses in it, or else he talks like a parrot, only making a noise by imitation, and framing certain sounds, which he has learnt of others; but not as a rational creature, using them for signs of ideas, which he has in his mind. The hearer also is supposed to understand the terms as the speaker uses them, or else he talks jargon, and makes an unintelligible noise. And therefore he trifles with words, who makes such a proposition, which, when 'tis made, contains no more than one of the

terms does, and which a man was supposed to know before: v.g. 'a triangle hath three sides', or 'saffron is yellow'. And this is no further tolerable, than where a man goes to explain his terms, to one who is supposed or declares himself not to understand him: and then it teaches only the signification of that word, and the use of that sign.

§8. But no real knowledge. We can know then the truth of two sorts of propositions, with perfect certainty; The one is, of those trifling propositions, which have a certainty in them, but 'tis but a verbal certainty, but not instructive. And, secondly, we can know the truth, and so may be certain in propositions, which affirm something of another, which is a necessary consequence of its precise complex idea, but not contained in it. As that 'the external angle of all triangles, is bigger than either of the opposite internal angles'; which relation of the outward angle, to either of the opposite internal angles, making no part of the complex idea, signified by the name triangle, this is a real truth, and conveys with it instructive real knowledge.

§9. General propositions concerning substances are often trifling. We having little or no knowledge of what combinations there be of simple ideas existing together in substances, but by our senses, we cannot make any universal certain propositions concerning them, any further than our nominal essences lead us: Which being to a very few and inconsiderable truths, in respect of those which depend on their real constitutions, the general propositions that are made about substances, if they are certain, are for the most part but trifling; and if they are instructive, are uncertain, and such as we can have no knowledge of their real truth, how much soever constant observation and analogy may assist our judgment in guessing. Hence it comes to pass, that one may often meet with very clear and coherent discourses, that amount yet to nothing. For 'tis plain, that names of substantial beings, as well as others, as far as they have relative significations affixed to them, may, with great truth, be joined negatively and affirmatively in propositions, as their relative definitions make them fit to be so joined; and propositions consisting of such terms, may, with the same clearness, be deduced one from another, as those that convey the most real truths; and all this, without any knowledge of the nature or reality of things existing without us. By this method, one may make demonstrations and undoubted propositions in words, and yet thereby advance not one jot in the knowledge of the truth of things: v.g. he that having learnt these following words, with their

ordinary mutual relative acceptations annexed to them: v.g. substance, man, animal, form, soul, vegetative, sensitive, rational, may make several undoubted propositions about the soul, without knowing at all what the soul really is; and of this sort, a man may find an infinite number of propositions, reasonings, and conclusions, in books of metaphysics, school divinity, and some sort of natural philosophy; and after all, know as little of God, spirits, or bodies, as he did before he set out.

§10. And why. He that hath liberty to define, i.e. determine the signification of his names of substances, (as certainly everyone does in effect, who makes them stand for his own ideas,) and makes their significations at a venture, taking them from his own or other men's fancies, and not from an examination or inquiry into the nature of things themselves, may, with little trouble, demonstrate them one of another, according to those several respects, and mutual relations he has given them one to another; wherein, however things agree, or disagree, in their own nature, he needs mind nothing but his own notions, with the names he hath bestowed upon them: but thereby no more increases in his own knowledge, than he does his riches, who taking a bag of counters, calls one in a certain place a pound, another in another place, a shilling, and a third in a third place, a penny; and so proceeding, may undoubtedly reckon right, and cast up a great sum, according to his counters so placed, and standing for more or less as he pleases, without being one jot the richer, or without even knowing how much a pound, shilling, or penny is, but only that one is contained in the other twenty times, and contains the other twelve; which a man may also do in the signification of words, by making them in respect of one another, more or less, or equally comprehensive.

§11. Thirdly, using words variously, is trifling with them. Though yet concerning most words used in discourses, equally argumentative and controversial, there is this more to be complained of, which is the worst sort of trifling, and which sets us yet further from the certainty of knowledge we hope to attain by them, or find in them, viz. that most writers are so far from instructing us in the nature and knowledge of things, that they use their words loosely and uncertainly, and do not. by using them constantly and steadily in the same significations, make plain and clear deductions of words one from another, and make their discourses coherent and clear, (how

little soever they were instructive) which were not difficult to do, did they not find it convenient to shelter their ignorance or obstinacy, under the obscurity and perplexedness of their terms; to which, perhaps, in advertency; and ill custom do in many men much contribute.

§12. Marks of verbal propositions, first, predication in abstract. To conclude. barely verbal propositions may be known by these following marks:

First, all propositions wherein two abstract terms are affirmed one of another, are barely about the signification of sounds. For since no abstract idea can be the same with any other but itself, when its abstract name is affirmed of any other term, it can signify no more but this, that it may, or ought to be called by that name; or that these two names signify the same idea. Thus, should anyone say that 'parsimony is frugality', that 'gratitude is justice'; that this or that action is, or is not temperate: however specious these and the like propositions may at first sight seem, yet when we come to press them, and examine nicely what they contain, we shall find, that it all amounts to nothing. but the signification of those terms.

§13. Secondly, a part of the definition predicated of any term.

Secondly, all propositions, wherein a part of the complex idea, which any term stands for, is predicated of that term, are only verbal: v.g. to say, that gold is a metal, or heavy. And thus all propositions, wherein more comprehensive words, called genera, are affirmed of subordinate, or less comprehensive, called species, or individuals, are barely verbal.

When by these two rules, we have examined the propositions, that make up the discourses we ordinarily meet with, both in and out of books, we shall, perhaps, find that a greater part of them, than is usually suspected, are purely about the signification of words, and contain nothing in them, but the use and application of these signs.

This, I think, I may lay down for an infallible rule, that, wherever the distinct idea any word stands for, is not known and considered, and something not contained in the idea, is not affirmed, or denied of it, there our thoughts stick wholly in sounds, and are able to attain no real truth or falsehood. This, perhaps, if well heeded, might save us a

great deal of useless amusement and dispute;and very much shorten our trouble, and wandering, in the search of real and true knowledge.

Chapter IX Of our Knowledge of Existence

§1. General certain propositions concern not existence. Hitherto we have only considered the essences of things; which being only abstract ideas, and thereby removed in our thoughts from particular existence, (that being the proper operation of the mind, in abstraction, to consider an idea under no other existence, but what it has in the understanding,) gives us no knowledge of real existence at all. Where by the way we may take notice, that universal propositions,of whose truth or falsehood we can have certain knowledge,concern not existence; and further, that all particular affirmations or negations, that would not be certain if they were made general, are only concerning existence; they declaring only the accidental union or separation of ideas in things existing, which, in their abstract natures, have no known necessary union or repugnancy.

§2. A threefold knowledge of existence. But leaving the nature of propositions, and different ways of predication to be considered more at large in another place, let us proceed now to inquire concerning our knowledge of the existence of things, and how we come by it.I say then, that we have the knowledge of our own existence by intuition; of the existence of God by demonstration; and of other things by sensation.

§3. Our knowledge of our own existence is intuitive. As for our own existence, we perceive it so plainly, and so certainly, that it neither needs, nor is capable of any proof. For nothing can be more evident to us, than our own existence. I think, I reason, I feel pleasure and pain;can any of these be more evident to me , than my own existence' If I doubt of all other things, that very doubt makes me perceive my own existence, and will not suffer me to doubt of that. For if I know I feel pain, 'tis evident, I have as certain perception of my own existence,as of the existence of the pain I feel: or if I know I doubt, I have as certain perception of the existence of the thing doubting, as of that thought which I call doubt. Experience then convinces us, that we have an intuitive knowledge of our own existence, and an internal infallible perception that we are. In every act of sensation, reasoning or thinking, we are conscious to ourselves

of our own being; and, in this matter, come not short of the highest degree of certainty.

Chapter X Of our Knowledge of the Existence of a God

§1. We are capable of knowing certainly that there is a God. Though God has given us no innate ideas of himself; though he has stamped no original characters on our minds, wherein we may read his being: yet having furnished us with those faculties. our minds are endowed with, he hath not left himself without witness: since we have sense, perception, and reason, and cannot want a clear proof of him, as long as we carry ourselves about us. Nor can we justly complain of our ignorance in this great point, since he has so plentifully provided us with the means to discover, and know him, so far as is necessary to the end of our being, and the great concernment of our happiness. But though this be the most obvious truth that reason discovers; and though its evidence be (if I mistake not) equal to mathematical certainty: yet it requires thought and attention; and the mind must apply itself to a regular deduction of it from some part of our intuitive knowledge, or else we shall be as uncertain, and ignorant of this, as of other propositions, which are in themselves capable of clear demonstration. To show therefore, that we are capable of knowing, i.e. being certain that there is a God, and how we may come by this certainty, I think we need go no further than ourselves, and that undoubted knowledge we have of our own existence.

§2. Man knows that he himself is. I think 'tis beyond question, that man has a clear perception of his own being; he knows certainly, that he exists, and that he is something. He that can doubt, whether he be anything, or no, I speak not to, no more than I would argue with pure nothing, or endeavour to convince nonentity that it were something. If anyone pretends to be so sceptical, as to deny his own existence, (for really to doubt of it, is manifestly impossible,) let him for me enjoy his beloved happiness of being nothing, until hunger, or some other pain convince him of the contrary. This, then, I think, I may take for a truth, which every one's certain knowledge assures him of, beyond the liberty of doubting, viz. that he is something that actually exists.

§3 He knows also, that nothing cannot produce a being, therefore something eternal. In the next place, man knows, by an intuitive

certainly, that bare nothing can no more produce any real being, than it can be equal to two right angles. If a man knows not that nonentity, or the absence of all being, cannot be equal to two right angles, 'tis impossible he should know any demonstration in Euclid. If therefore we know there is some real being, and that nonentity cannot produce any real being, 'tis an evident demonstration, that from eternity there has been something; since what was not from eternity, had a beginning; and what had a beginning, must be produced by something else.

§4. That eternal being must be most powerful. Next, 'tis evident, that what had its being and beginning from another, must also have all that which is in, and belongs to its being from another too. All the powers it has, must be owing to, and received from the same source. This eternal source then of all being must also be the source and original of all power; and so this eternal being must be also the most powerful.

§5. And most knowing. Again, a man finds in himself perception, and knowledge. We have then got one step further; and we are certain now, that there is not only some being, but some knowing, intelligent being in the world.

There was a time then, when there was no knowing being, and when knowledge began to be; or else, there has been also a knowing being from eternity. If it be said, there was a time when no being had any knowledge, when that eternal being was void of all understanding. I reply, that then it was impossible there should ever have been any knowledge. it being as impossible, that things wholly void of knowledge, and operating blindly, and without any perception, should produce a knowing being, as 'tis impossible, that a triangle should make itself three angles bigger than two right ones. For 'tis as repugnant to the idea of senseless matter, that it should put into itself sense, perception, and knowledge, as 'tis repugnant to the idea of a triangle, that it should put into itself greater angles than two right ones.

§6. And therefore God. Thus from the consideration of ourselves, and what we infallibly find in our own constitutions, our reason leads us to the knowledge of this certain and evident truth, that 'there is an eternal, most powerful, and most knowing being'; which whether anyone will please to call God, it matters not. The thing is

evident, and from this idea duly considered, will easily be deduced all those other attributes, which we ought to ascribe to this eternal being. If nevertheless anyone should be found so senselessly arrogant, as to suppose man alone knowing and wise, but yet the product of mere ignorance and chance; and that all the rest of the universe acted only by that blind haphazard: I shall leave with him that very rational and emphatical rebuke of Tully 1.2. de leg. to be considered at his leisure: 'What can be more sillily arrogant and misbecoming, than for a man to think that he has a mind and understanding in him, but yet in all the universe beside, there is no such thing' Or that those things, which with the utmost stretch of his reason he can scarce comprehend, should be moved and managed without any reason at all" 'Quid est enim verius, quam neminem esse oportere tam stulte arrogantem, ut in se mentem et rationem putet inesse, in caelo mundoque non putet' Aut ea quae vix summa ingenii ratione comprehendat, nulla ratione moveri putet ? '

From what has been said, 'tis plain to me, we have a more certain knowledge of the existence of a God, than of anything our senses have not immediately discovered to us. Nay, I presume I may say, that we more certainly know that there is a God, than that there is anything else without us. When I say we know, I mean there is such a knowledge within our reach, which we cannot miss, if we will but apply our minds to that, as we do to several other inquiries.

§7. Our idea of a most perfect being, not the sole proof of a God. How far the idea of a most perfect being, which a man may frame in his mind, does or does not prove the existence of a God, I will not here examine. For in the different make of men's tempers and application of their thoughts, some arguments prevail more on one, and some on another, for the confirmation of the same truth. But yet, I think, this I may say, that 'tis an ill way of establishing this truth, and silencing atheists, to lay the whole stress of so important a point, as this, upon that sole foundation: and take some men's having that idea of God in their minds, (for 'tis evident, some men have none, and some worse than none, and the most very different,) for the only proof of a Deity; and out of an over fondness of that darling invention, cashier, or at least endeavour to invalidate all other arguments, and forbid us to hearken to those proofs, as being weak, or fallacious, which our own existence, and the sensible parts of the universe, offer so clearly, and cogently to our thoughts, that I deem it

impossible for a considering man to withstand them. For I judge it as certain and clear a truth, as can anywhere be delivered, that 'the invisible things of God are clearly seen from the creation of the world, being understood by the things that are made, even his eternal power and Godhead.' Though our own being furnishes us, as I have shown, with an evident, and incontestable proof of a Deity; And I believe nobody can avoid the cogency of it, who will but as carefully attend to it, as to any other demonstration of so many parts: yet this being so fundamental a truth, and of that consequence, that all religion and genuine morality depend thereon, I doubt not but I shall be forgiven by my reader, if I go over some parts of this argument again, and enlarge a little more upon them.

§8. Something from eternity. There is no truth more evident, than that something must be from eternity. I never yet heard of any one so unreasonable, or that could suppose so manifest a contradiction, as a time, wherein there was perfectly nothing. This being of all absurdities the greatest, to imagine that pure nothing, the perfect negation and absence of all beings, should ever produce any real existence.

It being, then unavoidable for all rational creatures, to conclude, that something has existed from eternity; let us next see what kind of thing that must be.

§9. Two sorts of beings, cogitative and incogitative. There are but two sorts of beings in the world, that man knows or conceives.

First, such as are purely material, without sense, perception, or thought, as the clippings of our beards, and parings of our nails.

Secondly, sensible, thinking, perceiving beings, such as we find ourselves to be. which, if you please, we will hereafter call cogitative and incogitative beings; which to our present purpose, if for nothing else, are, perhaps, better terms, than material and immaterial.

§10. Incogitative being cannot produce a cogitative. If then there must be something eternal, let us see what sort of being it must be. And to that, 'tis very obvious to reason, that it must necessarily be a cogitative being. For 'tis as impossible to conceive, that ever bare incogitative matter should produce a thinking intelligent being, as that nothing should of itself produce matter. Let us suppose any parcel of

matter eternal, great or small, we shall find it, in itself, able to produce nothing. For example; let us suppose the matter of the next pebble, we meet with eternal, closely united, and the parts firmly at rest together, if there were no other being in the world, must it not eternally remain so, a dead inactive lump? Is it possible to conceive it can add motion to itself, being purely matter, or produce anything? Matter, then, by its own strength, cannot produce in itself so much as motion: the motion it has, must also be from eternity, or else be produced, and added to matter by some other being more powerful than matter; matter, as is evident, having not power to produce motion in itself. But let us suppose motion eternal too; yet matter, incogitative matter and motion, whatever changes it might produce of figure and bulk, could never produce thought: knowledge will still be as far beyond the power of motion and matter to produce, as matter is beyond the power of nothing, or non-entity to produce. And I appeal to everyone's own thoughts, whether he cannot as easily conceive matter produced by nothing, as thought to be produced by pure matter, when before there was no such thing as thought, or an intelligent being existing. Divide matter into as many parts as you will, (which we are apt to imagine a sort of spiritualizing, or making a thinking thing of it,) vary the figure and motion of it, as much as you please, a globe, cube, cone, prism, cylinder, etc. whose diameters are but 100,000th part of a gry*, (*A gry $\frac{1}{10}$ is of a line, a line $\frac{1}{10}$ of an inch, an inch $\frac{1}{10}$ of a philosophical foot, a philosophical foot $\frac{1}{3}$ of a pendulum, whose diadroms, in the latitude of 45 degrees, are each equal to one second of time, or $\frac{1}{60}$ of a minute. I have affectedly made use of this measure here and the parts of it, under a decimal division with names to them; because, I think, it would be of general convenience, that this should be the common measure in the commonwealth of letters.) will operate no otherwise upon other bodies of proportionable bulk, than those of an inch or foot diameter; and you may as rationally expect to produce sense, thought, and knowledge, by putting together in a certain figure and motion, gross particles of matter, as by those that are the very minutest, that do anywhere exist. They knock, impel, and resist one another, just as the greater do, and that is all they can do. So that if we will suppose nothing first, or eternal; matter can never begin to be: if we suppose bare matter, without motion, eternal, motion can never begin to be: if we suppose only matter and motion first, or eternal, thought can never begin to be. For 'tis impossible to conceive that matter, either with or without motion could have originally in and from itself sense, perception, and knowledge, as is

evident from hence, that then sense, perception, and knowledge must be a property eternally inseparable from matter and every particle of it. Not to add, that though our general or specific conception of matter makes us speak of it as one thing, yet really all matter is not one individual thing, neither is there any such thing existing as one material being or one single body that we know or can conceive. And therefore, if matter were the eternal first cogitative being, there would not be one eternal infinite cogitative being, but an infinite number of eternal finite cogitative beings, independent one of another, of limited force, and distinct thoughts, which could never produce that order, harmony, and beauty which are to be found in nature. Since therefore whatsoever is the first eternal being must necessarily be cogitative; and whatsoever is first of all things must necessarily contain in it, and actually have, at least, all the perfections that can ever after exist; nor can it ever give to another any perfection that it hath not, either actually in itself, or at least in a higher degree, it necessarily follows, that the first eternal being cannot be matter.

§11. Therefore there has been an eternal wisdom. If therefore it be evident, that something necessarily must exist from eternity, 'tis also as evident, that that something must necessarily be a cogitative being: for 'tis as impossible, that incogitative matter should produce a cogitative being, as that nothing, or the negation of all being, should produce a positive being or matter.

§12. Though this discovery of the necessary existence of an eternal mind, does sufficiently lead us into the knowledge of God; since it will hence follow, that all other knowing beings that have a beginning, must depend on him, and have no other ways of knowledge, or extent of power, than what he gives them; and therefore if he made those, he made also the less excellent pieces of this universe, all inanimate beings, whereby his omniscience, power, and providence, will be established, and all his other attributes necessarily follow: yet, to clear up this a little further, we will see what doubts can be raised against it.

§13. Whether material or no. First, perhaps it will be said, that though it be as clear as demonstration can make it, that there must be an eternal being, and that being must also be knowing: yet it does not follow, but that thinking being may also be material. Let it be so, it equally still follows, that there is a God. For if there be an

eternal,omniscient, omnipotent being, 'tis certain that there is a God,whether you imagine that being to be material or no. But herein, I suppose, lies the danger and deceit of that supposition: there being no way to avoid the demonstration, that there is an eternal knowing being, men, devoted to matter, would willingly have it granted,that this knowing being is material; and then letting slide out of their minds, or the discourse, the demonstration whereby an eternal knowing being was proved necessarily to exist, would argue all to be matter, and so deny a God, that is, an eternal cogitative being;whereby they are so far from establishing, that they destroy their own hypothesis. For, if there can be, in their opinion, eternal matter,without any eternal cogitative being, they manifestly separate matter and thinking, and suppose no necessary connexion of the one with the other, and so establish the necessity of an eternal spirit, but not of matter; since it has been proved already, that an eternal cogitative being is unavoidably to be granted. Now, if thinking and matter may be separated, the eternal existence of matter, will not follow from the eternal existence of a cogitative being, and they suppose it to no purpose.

§14. Not material, first, because every particle of matter is not cogitative. But now let us see how they can satisfy themselves, or others, that this eternal thinking being is material.

First, I would ask them, whether they imagine that all matter,every particle of matter, thinks' This, I suppose, they will scarce say;since then there would be as many eternal thinking beings, as there are particles of matter, and so an infinity of gods. And yet if they will not allow matter as matter, that is, every particle of matter to be as well cogitative as extended, they will have as hard a task to make out to their own reasons, a cogitative being out of incogitative particles,as an extended being out of unextended parts, if I may so speak.

§15. Secondly, one particle alone of matter cannot be cogitative.Secondly,If all matter does not think, I next ask, Whether it be only one atom that does so' This has as many absurdities as the other; for then this atom of matter must be alone eternal, or not. If this alone be eternal, then this alone, by its powerful thought, or will, made all the rest of matter. And so we have the creation of matter by a powerful thought, which is that the materialists stick at. For if they

suppose one single thinking atom, to have produced all the rest of matter, they cannot ascribe that preeminency to it upon any other account, than that of its thinking, the only supposed difference. But allow it to be by some other way, which is above our conception, it must be still creation; and these men must give up their great maxim, *ex nihilo nil fit*. If it be said, that all the rest of matter is equally eternal as that thinking atom, it will be to say anything at pleasure, though never so absurd: for to suppose all matter eternal, and yet one small particle in knowledge and power infinitely above all the rest, is without any the least appearance of reason to frame an hypothesis. Every particle of matter, as matter, is capable of all the same figures and motions of any other; and I challenge anyone in his thoughts, to add anything else to one above another.

§16. Thirdly, a system of incogitative matter, cannot be cogitative. Thirdly, If then neither one peculiar atom alone, can be this eternal thinking being; nor all matter, as matter; i.e. every particle of matter can be it, it only remains, that 'tis some certain system of matter duly put together, that is this thinking eternal being. This is that, which, I imagine, is that notion, which men are aptest to have of God; who would have him a material being, as most readily suggested to them, by the ordinary conceit they have of themselves, and other men, which they take to be material thinking beings. But this imagination, however more natural, is no less absurd than the other: for to suppose the eternal thinking being, to be nothing else but a composition of particles of matter, each whereof is incogitative, is to ascribe all the wisdom and knowledge of that eternal being only to the juxtaposition of parts; than which, nothing can be more absurd. For unthinking particles of matter, however put together, can have nothing thereby added to them, but a new relation of position, which 'tis impossible should give thought and knowledge to them.

§17. Whether in motion, or at rest. But further, this corporeal system either has all its parts at rest, or 'tis a certain motion of the parts wherein its thinking consists. If it be perfectly at rest, 'tis but one lump, and so can have no privileges above one atom.

If it be the motion of its parts, on which its thinking depends, all the thoughts there must be unavoidably accidental, and limited; since all the particles that by motion cause thought, being each of them in itself without any thought, cannot regulate its own motions, much less

be regulated by the thought of the whole; since that thought is not the cause of motion, (for then it must be antecedent to it, and so without it,) but the consequence of it; whereby freedom, power, choice, and all rational and wise thinking or acting, will be quite taken away: so that such a thinking being will be no better nor wiser, than pure blind matter; since to resolve all into the accidental unguided motions of blind matter, or into thought depending on unguided motions of blind matter, is the same thing; not to mention the narrowness of such thoughts and knowledge, that must depend on the motion of such parts. But there needs no enumeration of any more absurdities and impossibilities in this hypothesis, (however full of them it be,) than that before mentioned; since, let this thinking system be all, or a part of the matter of the universe, 'tis impossible that any one particle, should either know its own, or the motion of any other particle, or the whole know the motion of every particle; and so regulate its own thoughts or motions, or indeed have any thought resulting from such motion.

§18. Matter not co-eternal with an eternal mind. Others would have matter to be eternal, notwithstanding that they allow an eternal, cogitative, immaterial being. This, though it take not away the being of a God, yet, since it denies one and the first great piece of his workmanship, the creation, let us consider it a little. Matter must be allowed eternal: Why? because you cannot conceive how it can be made out of nothing: why do you not also think yourself eternal?

You will answer, perhaps, because about twenty or forty years since, you began to be. But if I ask you, what that you is, which began then to be, you can scarce tell me. The matter whereof you are made, began not then to be: for if it did, then 'tis not eternal: but it began to be put together in such a fashion and frame, as makes up your body; but yet that frame of particles, is not you, it makes not that thinking thing you are; (for I have now to do with one, who allows an eternal, immaterial, thinking being, but would have unthinking matter eternal too;) therefore, when did that thinking thing begin to be? If it did never begin to be, then have you always been a thinking thing from eternity; the absurdity whereof I need not confute, till I meet with one who is so void of understanding as to own it. If therefore you can allow a thinking thing to be made out of nothing, (as all things that are not eternal must be,) why also can you not allow it possible, for a material being to be made out of nothing, by an equal power, but

that you have the experience of the one in view, and not of the other' Though, when well considered, creation of a spirit will be found to require no less power than the creation of matter. Nay possibly, if we would emancipate ourselves from vulgar notions, and raise our thoughts, as far as they would reach, to a closer contemplation of things, we might be able to aim at some dim and seeming conception how matter might at first be made, and begin to exist by the power of that eternal first being: but to give beginning and being to a spirit would be found a more inconceivable effect of omnipotent power. But this being what would perhaps lead us too far from the notions, on which the philosophy now in the world is built, it would not be pardonable to deviate so far from them; or to inquire, so far as grammar itself would authorize, if the common settled opinion opposes it: especially in this place, where the received doctrine serves well enough to our present purpose, and leaves this past doubt, that the creation or beginning of any one SUBSTANCE out of nothing, being once admitted, the creation of all other, but the CREATOR himself, may, with the same ease, be supposed.

§19. But you will say, Is it not impossible to admit of the making anything out of nothing, since we cannot possibly conceive it? I answer, no: I. because 'tis not reasonable to deny the power of an infinite being, because we cannot comprehend its operations. We do not deny other effects upon this ground, because we cannot possibly conceive the manner of their production. We cannot conceive how anything but impulse of body can move body; and yet that is not a reason sufficient to make us deny it possible, against the constant experience, we have of it in ourselves, in all our voluntary motions, which are produced in us only by the free action or thought of our own minds; and are not, nor can be the effects of the impulse or determination of the motion of blind matter, in or upon our bodies; for then it could not be in our power or choice to alter it. For example: my right hand writes, whilst my left hand is still: what causes rest in one, and motion in the other? Nothing but my will, a thought of my mind; my thought only changing, the right hand rests, and the left hand moves. This is matter of fact, which cannot be denied: explain this, and make it intelligible, and then the next step will be to understand creation. For the giving a new determination to the motion of the animal spirits (which some make use of to explain voluntary motion) clears not the difficulty one jot. To alter the determination of motion, being in this case no easier nor less, than to give motion itself: since the new determination given

to the animal spirits must be either immediately by thought, or by some other body put in their way by thought, which was not in their way before, and so must owe its motion to thought; either of which leaves voluntary motion as unintelligible as it was before. In the meantime,'tis an overvaluing ourselves, to reduce all to the narrow measure of our capacities; and to conclude, all things impossible to be done,whose manner of doing exceeds our comprehension. This is to make our comprehension infinite, or God finite, when what He can do, is limited to what we can conceive of it. If you do not understand the operations of your own finite mind, that thinking thing within you,do not deem it strange, that you cannot comprehend the operations of that eternal infinite mind, who made and governs all things, and whom the heaven of heavens cannot contain.

Chapter XI Of our Knowledge of the Existence of other Things

§1. Is to be had only by sensation. The knowledge of our own being, we have by intuition. The existence of a God, reason clearly makes known to us, as has been shown.

The knowledge of the existence of any other thing we can have only by sensation: for there being no necessary connexion of real existence, with any idea a man hath in his memory, nor of any other existence but that of God, with the existence of any particular man; no particular man can know the existence of any other being, but only when, by actual operating upon him, it makes itself perceived by him. For the having the idea of anything in our mind, no more proves the existence of that thing, than the picture of a man evidences his being in the world, or the visions of a dream make thereby a true history.

§2. Instance whiteness of this paper. 'Tis therefore the actual receiving of ideas from without, that gives us notice of the existence of other things, and makes us know, that something doth exist at that time without us, which causes that idea in us, though perhaps we neither know nor consider how it does it: For it takes not from the certainty of our senses, and the ideas we receive by them, that we know not the manner wherein they are produced: v.g. whilst I write this, I have, by the paper affecting my eyes, that idea produced in my mind, which whatever object causes, I call white; by which I know that that quality or accident (i.e. whose appearance before my eyes, always causes that idea) doth really exist, and hath a being without me. And of this, the greatest assurance I can possibly have, and to which my faculties can attain, is the testimony of my eyes, which are the proper and sole judges of this thing, whose testimony I have reason to rely on, as so certain, that I can no more doubt, whilst I write, this, that I see white and black, and that something really exists, that causes that sensation in me, than that I write or move my hand; which is a certainty as great, as human nature is capable of, concerning the existence of anything, but a man's self alone, and of God.

§3. This though not so certain as demonstration, yet may be called knowledge and proves the existence of things without us. The

notice we have by our senses, of the existing of things without us, though it be not altogether so certain as our intuitive knowledge, or the deductions of our reason, employed about the clear abstract ideas of our own minds; yet 'tis an assurance that deserves the name of knowledge. If we persuade ourselves, that our faculties act and inform us right, concerning the existence of those objects that affect them, it cannot pass for an illgrounded confidence: for I think nobody can, in earnest, be so sceptical, as to be uncertain of the existence of those things which he sees and feels. At least, he that can doubt so far, (whatever he may have with his own thoughts) will never have any controversy with me; since he can never be sure I say anything contrary to his opinion. As to myself, I think God has given me assurance enough of the existence of things without me: since by their different application, I can produce in myself both pleasure and pain, which is one great concernment of my present state. This is certain, the confidence that our faculties do not herein deceive us, is the greatest assurance we are capable of, concerning the existence of material beings. For we cannot act anything, but by our faculties; nor talk of knowledge itself, but by the help of those faculties, which are fitted to apprehend even what knowledge is. But besides the assurance we have from our senses themselves, that they do not err in the information they give us, of the existence of things without us, when they are affected by them, we are further confirmed in this assurance, by other concurrent reasons.

§4. First, because we cannot have them but by the inlet of the senses. First, 'tis plain those perceptions are produced in us by exterior causes affecting our senses: because those that want the organs of any sense, never can have the ideas belonging to that sense produced in their minds. This is too evident to be doubted: and therefore we cannot but be assured, that they come in by the organs of that sense, and no other way. The organs themselves, 'tis plain, do not produce them: for then the eyes of a man in the dark, would produce colours, and his nose smell roses in the winter: but we see nobody gets the relish of a pineapple, till he goes to the Indies, where it is, and tastes it.

§5. Because an idea from actual sensation, and another from memory, are very distinct perceptions. Secondly, because sometimes I find, that I cannot avoid the having those ideas produced in my mind. For though when my eyes are shut, or windows fast, I can at pleasure

recall to my mind the ideas of light, or the sun, which former sensations had lodged in my memory; so I can at pleasure lay by that idea, and take into my view that of the smell of a rose, or taste of sugar. But if I turn my eyes at noon towards the sun, I cannot avoid the ideas, which the light, or sun, then produces in me. So that there is a manifest difference, between the ideas laid up in my memory; (over which, if they were there only, I should have constantly the same power to dispose of them, and lay them by at pleasure) and those which force themselves upon me, and I cannot avoid having. And therefore it must needs be some exterior cause, and the brisk acting of some objects without me, whose efficacy I cannot resist, that produces those ideas in my mind, whether I will or no. Besides, there is nobody who doth not perceive the difference in himself, between contemplating the sun, as he hath the idea of it in his memory, and actually looking upon it: of which two, his perception is so distinct, that few of his ideas are more distinguishable one from another: and therefore he hath certain knowledge that they are not both memory, or the actions of his mind, and fancies only within him; but that actual seeing hath a cause without.

§6. Thirdly, pleasure or pain, which accompanies actual sensation, accompanies not the returning of those ideas without the external objects. Thirdly, add to this, that many of those ideas are produced in us with pain, which afterwards we remember without the least offence. Thus, the pain of heat or cold, when the idea of 'tis revived in our minds, gives us no disturbance; which, when felt, was very troublesome, and is again, when actually repeated: which is occasioned by the disorder the external object causes in our bodies, when applied to it: and we remember the pains of hunger, thirst, or the headache, without any pain at all; which would either never disturb us, or else constantly do it, as often as we thought of it, were there nothing more but ideas floating in our minds, and appearances entertaining our fancies, without the real existence of things affecting us from abroad. The same may be said of pleasure, accompanying several actual sensations: and though mathematical demonstration depends not upon sense, yet the examining them by diagrams gives great credit to the evidence of our sight, and seems to give it a certainty approaching to that of demonstration itself. For, it would be very strange, that a man should allow it for an undeniable truth, that two angles of a figure, which he measures by lines and angles of a diagram, should be bigger one than the other; and yet doubt of the

existence of those lines and angles, which by looking on, he makes use of to measure that by.

§7. Fourthly, our senses assist one another's testimony of the existence of outward things. Fourthly, our senses in many cases bear witness to the truth of each other's report, concerning the existence of sensible things without us. He that sees a fire, may, if he doubt whether it be anything more than a bare fancy, feel it too; and be convinced, by putting his hand in it. Which certainly could never be put into such exquisite pain, by a bare idea or phantom, unless that the pain be a fancy too: which yet he cannot, when the burn is well, by raising the idea of it, bring upon himself again.

Thus I see, whilst I write this, I can change the appearance of the paper; and by designing the letters, tell beforehand what new idea it shall exhibit the very next moment, barely by drawing my pen over it: which will neither appear (let me fancy as much as I will) if my hands stand still; or though I move my pen, if my eyes be shut: nor when those characters are once made on the paper, can I choose afterwards but see them as they are; that is, have the ideas of such letters as I have made. Whence 'tis manifest, that they are not barely the sport and play of my own imagination, when I find, that the characters, that were made at the pleasure of my own thoughts, do not obey them; nor yet cease to be, whenever I shall fancy it, but continue to affect my senses constantly and regularly, according to the figures I made them. To which if we will add, that the sight of those shall, from another man, draw such sounds, as I beforehand design they shall stand for, there will be little reason left to doubt, that those words, I write do really exist without me, when they cause a long series of regular sounds to affect my ears, which could not be the effect of my imagination, nor could my memory retain them in that order.

§8. This certainty is as great as our condition needs. But yet, if after all this, anyone will be so sceptical, as to distrust his senses, and to affirm, that all we see and hear, feel and taste, think and do, during our whole being, is but the series and deluding appearances of a long dream, whereof there is no reality; and therefore will question the existence of all things, or our knowledge of anything: I must desire him to consider, that if all be a dream, then he doth but dream, that he makes the question; and so 'tis not much matter, that a waking man should answer him. But yet, if he pleases, he may dream that I

make him this answer, that the certainty of things existing in rerum natura, when we have the testimony of our senses for it, is not only as great as our frame can attain to, but as our condition needs. For our faculties being suited not to the full extent of being, nor to a perfect, clear, comprehensive knowledge of things free from all doubt and scruple; but to the preservation of us, in whom they are; and accommodated to the use of life: they serve to our purpose well enough, if they will but give us certain notice of those things, which are convenient or inconvenient to us. For he that sees a candle burning, and hath experimented the force of its flame, by putting his finger in it, will little doubt, that this is something existing without him, which does him harm, and puts him to great pain: which is assurance enough, when no man requires greater certainty, to govern his actions by, than what is as certain as his actions themselves. And if our dreamer pleases to try. whether the glowing heat of a glass furnace. be barely a wandering imagination in a drowsy man's fancy, by putting his hand into it, he may perhaps be wakened into a certainty greater than he could wish, that 'tis something more than bare imagination. So that this evidence is as great, as we can desire, being as certain to us as our pleasure or pain; i.e. happiness or misery; beyond which we have no concernment, either of knowing or being. Such an assurance of the existence of things without us, is sufficient to direct us in the attaining the good. and avoiding the evil, which is caused by them, which is the important concernment we have of being made acquainted with them.

§9. But reaches no further than actual sensation. In fine then, when our senses do actually convey into our understandings any idea, we cannot but be satisfied, that there doth something at that time really exist without us, which doth affect our senses, and by them give notice of itself to our apprehensive faculties, and actually produce that idea, which we then perceive: and we cannot so far distrust their testimony, as to doubt, that such collections of simple ideas, as we have observed by our senses to be united together, do really exist together. But this knowledge extends as far as the present testimony of our senses, employed about particular objects, that do then affect them, and no further. For if I saw such a collection of simple ideas, as is wont to be called man, existing together one minute since, and am now alone, I cannot be certain, that the same man exists now, since there is no necessary connexion of his existence a minute since, with his existence now: by a thousand ways he may cease to be, since I had

the testimony of my senses for his existence. And if I cannot be certain, that the man I saw last today, is now in being, I can less be certain, that he is so, who hath been longer removed from my senses, and I have not seen since yesterday, or since the last year: and much less can I be certain of the existence of men, that I never saw. And therefore though it be highly probable, that millions of men do now exist, yet whilst I am alone writing this, I have not that certainty of it, which we strictly call knowledge; though the great likelihood of it puts me past doubt, and it be reasonable for me to do several things upon the confidence, that there are men (and men also of my acquaintance, with whom I have to do) now in the world: but this is but probability, not knowledge.

§10. Folly to expect demonstration in everything. Whereby yet we may observe, how foolish and vain a thing 'tis, for a man of a narrow knowledge, who having reason given him to judge of the different evidence and probability of things, and to be swayed accordingly; how vain, I say, 'tis to expect demonstration and certainty in things not capable of it; and refuse assent to very rational propositions, and act contrary to very plain and clear truths, because they cannot be made out so evident, as to surmount every the least (I will not say reason, but) pretence of doubting. He that in the ordinary affairs of life, would admit of nothing but direct plain demonstration, would be sure of nothing, in this world, but of perishing quickly. The wholesomeness of his meat or drink would not give him reason to venture on it: and I would fain know what 'tis he could do upon such grounds, as are capable of no doubt, no objection.

§11. Past existence is known by memory. As when our senses are actually employed about any object, we do know that it does exist; so by our memory we may be assured, that heretofore things, that affected our senses, have existed. And thus we have knowledge of the past existence of several things, whereof our senses having informed us, our memories still retain the ideas; and of this we are past all doubt, so long as we remember well. But this knowledge also reaches no further than our senses have formerly assured us. Thus seeing water at this instant, 'tis an unquestionable truth to me, that water, doth exist: and remembering that I saw it yesterday, it will also be always true; and as long as my memory retains it, always an undoubted proposition to me, that water did exist 10th July, 1688. as it will also be equally true, that a certain number of very fine colours

did exist, which at the same time, I saw upon a bubble of that water; but being now quite out of the sight both of the water and bubbles too, 'tis no more certainly known to me, that the water doth now exist, than that the bubbles or colours therein do so; it being no more necessary that water should exist today, because it existed yesterday, than that the colours or bubbles exist today, because they existed yesterday, though it be exceedingly much more probable; because water hath been observed to continue long in existence, but bubbles, and the colours on them quickly cease to be.

§12. The existence of spirits not knowable. What ideas we have of spirits, and how we come by them, I have already shown. But though we have those ideas in our minds, and know we have them there, the having the ideas of spirits does not make us know, that any such things do exist without us, or that there are any finite spirits, or any other spiritual beings, but the eternal God. We have ground from revelation, and several other reasons, to believe with assurance, that there are such creatures: but our senses not being able to discover them, we want the means of knowing their particular existences. For we can no more know, that there are finite spirits really existing, by the idea we have of such beings in our minds, than by the ideas any one has of fairies, or centaurs, he can come to know, that things answering those ideas do really exist.

And therefore concerning the existence of finite spirits, as well as several other things, we must content ourselves with the evidence of faith; but universal certain propositions concerning this matter are beyond our reach. For however true it may be, v.g. that all the intelligent spirits that God ever created, do still exist, yet it can never make a part of our certain knowledge. These and the like propositions, we may assent to, as highly probable, but are not, I fear, in this state, capable of knowing. We are not then to put others upon demonstrating, nor ourselves upon search of universal certainty in all those matters, wherein we are not capable of any other knowledge, but what our senses give us in this or that particular.

§13. Particular propositions concerning existences are knowable. By which it appears, that there are two sorts of propositions: 1. There is one sort of propositions concerning the existence of anything answerable to such an idea: as having the idea of an elephant, phoenix, motion, or an angel, in my mind, the first and

natural inquiry is, Whether such a thing does anywhere exist' And this knowledge is only of particulars. No existence of anything without us, but only of God, can certainly be known further than our senses inform us. 2. There is another sort of propositions, wherein is expressed the agreement or disagreement of our abstract ideas, and their dependence on one another. Such propositions may be universal and certain. So having the idea of God and myself, of fear and obedience, I cannot but be sure that God is to be feared and obeyed by me: and this proposition will be certain, concerning man in general, if I have made an abstract idea of such a species, whereof I am one particular. But yet this proposition, how certain soever, that men ought to fear and obey God, proves not to me the existence of men in the world, but will be true of all such creatures, whenever they do exist: which certainty of such general propositions, depends on the agreement or disagreement to be discovered in those abstract ideas.

§14. And general propositions concerning abstract ideas. In the former case, our knowledge is the consequence of the existence of things, producing ideas in our minds by our senses: in the latter, knowledge is the consequence of the ideas (be they what they will) that are in our minds producing there general certain propositions. Many of these are called *aeternae veritates*, and all of them indeed are so; not from being written all or any of them in the minds of all men, or that they were any of them propositions in anyone's mind, till he, having got the abstract ideas, joined or separated them by affirmation or negation. But wheresoever we can suppose such a creature as man is, endowed with such faculties, and thereby furnished with such ideas, as we have, we must conclude, he must needs, when he applies his thoughts to the consideration of his ideas, know the truth of certain propositions, that will arise from the agreement or disagreement, which he will perceive in his own ideas. Such propositions are therefore called eternal truths, not because they are eternal propositions actually formed, and antecedent to the understanding that at any time makes them; nor because they are imprinted on the mind from any patterns, that are anywhere of them out of the mind, and existed before: but because being once made, about abstract ideas, so as to be true, they will, whenever they can be supposed to be made again at any time past or to come, by a mind having those ideas, always actually be true. For names being supposed to stand perpetually for the same ideas, and the same ideas having immutably the same habitudes one to another, propositions

concerning any abstract ideas, that are once true, must needs be eternal verities.

Chapter XII Of the Improvement of our Knowledge

§1. Knowledge is not from maxims. It having been the common received opinion amongst men of letters, that maxims were the foundation of all knowledge; and that the sciences were each of them built upon certain *praecognita*, from whence the understanding was to take its rise, and by which it was to conduct itself, in its inquiries into the matters belonging to that science; the beaten road of the Schools has been, to lay down in the beginning one or more general propositions, as foundations whereon to build the knowledge that was to be had of that subject. These doctrines thus laid down for foundations of any science, were called principles, as the beginnings

from which we must set out, and look no further backwards in our inquiries, as we have already observed.

§2. (The occasion of that opinion.) One thing, which might probably give an occasion to this way of proceeding in other sciences, was (as I suppose) the good success it seemed to have in mathematics, wherein men, being observed to attain a great certainty of knowledge, these sciences came by preeminence to be called *maq'h'mata*, and *ma'qh'ot*, learning, or things learned, thoroughly learned, as having of all others the greatest certainty, clearness, and evidence in them.

§3. But from comparing clear and distinct ideas. But if anyone will consider, he will (I guess) find, that the great advancement and certainty of real knowledge, which men arrived to in these sciences, was not owing to the influence of these principles, nor derived from any peculiar advantage they received from two or three general maxims, laid down in the beginning; but from the clear, distinct, complete ideas their thoughts were employed about, and the relation of equality and excess so clear between some of them, that they had an intuitive knowledge, and by that, a way to discover it in others, and this without the help of those maxims. For I ask, Is it not possible for a young lad to know, that his whole body is bigger than his little finger, but by virtue of this axiom, that 'the whole is bigger than a part'; nor be assured of it, till he has learned that maxim? Or cannot a country wench know, that having received a shilling from one that owes her three, and a shilling also from another that owes her three, the remaining debts in each of their hands are equal? cannot she know this, I say, without she fetch the certainty of it from this maxim, that 'if you take equals from equals, the remainder will be equals', a maxim which possibly she never heard or thought of? I desire anyone to consider, from what has been elsewhere said, which is known first and clearest by most people, the particular instance, or the general rule; and which 'tis that gives life and birth to the other. These general rules are but the comparing our more general and abstract ideas, which are the workmanship of the mind, made, and names given to them, for the easier dispatch in its reasonings, and drawing into comprehensive terms, and short rules, its various and multiplied observations. But knowledge began in the mind, and was founded on particulars; though afterwards, perhaps, no notice be taken thereof: it being natural for the mind (forward still to enlarge its knowledge) most attentively to lay up those general notions, and

make the proper use of them, which is to disburden the memory of the cumbersome load of particulars. For I desire it may be considered what more certainty there is to a child, or anyone, that his body, little finger and all, is bigger than his little finger alone, after you have given to his body the name whole, and to his little finger the name part, than he could have had before; or what new knowledge concerning his body, can these two relative terms give him, which he could not have without them? Could he not know that his body was bigger than his little finger, if his language were yet so imperfect, that he had no such relative terms as whole and part? I ask further when he has got these names, how is he more certain that his body is a whole, and his little finger a part, than he was or might be certain before, he learnt those terms, that his body was bigger than his little finger? Anyone may as reasonably doubt or deny that his little finger is a part of his body, as that 'tis less than his body. And he that can doubt whether it be less, will as certainly doubt whether it be a part. So that the maxim, 'the whole is bigger than a part', can never be made use of to prove the little finger less than the body, but when 'tis useless, by being brought to convince one of a truth which he knows already. For he that does not certainly know that any parcel of matter, with another parcel of matter joined to it, is bigger than either of them alone, will never be able to know it by the help of these two relative terms whole and part, make of them what maxim you please.

§4. Dangerous to build upon precarious principles. But be it in the mathematics as it will, whether it be clearer, that taking an inch from a black line of two inches, and an inch from a red line of two inches, the remaining parts of the two lines will be equal, or that 'if you take equals from equals, the remainder will be equals': which, I say, of these two, is the clearer and first known, I leave to anyone to determine, it not being material to my present occasion. That which I have here to do, is to inquire, whether, if it be the readiest way to knowledge, to begin with general maxims, and build upon them, it be yet a safe way to take the principles, which are laid down in any other science, as unquestionable truths; and so receive them without examination, and adhere to them, without suffering to be doubted of, because mathematicians have been so happy, or so fair, to use none but self-evident and undeniable. If this be so, I know not what may not pass for truth in morality, what may not be introduced and proved in natural philosophy.

Let that principle of some of the old philosophers, That all is matter, and that there is nothing else, be received for certain and indubitable, and it will be easy to be seen by the writings of some that have revived it again in our days, what consequences it will lead us into. Let any one, with Polemo, take the world; or with the Stoics, the aether, or the sun; or, with Anaximenes, the air, to be God; and what a divinity, religion, and worship must we needs have! Nothing can be so dangerous, as principles thus taken up without questioning or examination; especially if they be such as concern morality, which influence men's lives, and give a bias to all their actions. Who might not justly expect another kind of life in Aristippus, who placed happiness in bodily pleasure; and in Antisthenes, who made virtue sufficient to felicity? And he who, with Plato, shall place beatitude in the knowledge of God, will have his thoughts raised to other contemplations, than those who look not beyond this spot of Earth, and those perishing things which are to be had in it. He that, with Archelaus, shall lay it down as a principle, that right and wrong, honest and dishonest, are defined only by laws, and not by nature, will have other measures of moral rectitude and pravity, than those who take it for granted, that we are under obligations antecedent to all human constitutions.

§5. This is no certain way to truth. If therefore, those that pass for principles, are not certain, (which we must have some way to know, that we may be able to distinguish them from those that are doubtful,) but are only made so to us by our blind assent, we are liable to be misled by them; and instead of being guided into truth, we shall, by principles, be only confirmed in mistake and error.

§6. But to compare clear complete ideas under steady names. But since the knowledge of the certainty of principles, as well as of all other truths, depends only upon the perception, we have, of the agreement, or disagreement of our ideas, the way to improve our knowledge, is not, I am sure, blindly, and with an implicit faith, to receive and swallow principles; but is, I think, to get and fix in our minds clear, distinct, and complete ideas, as far as they are to be had, and annex to them proper and constant names. And thus, perhaps, without any other principles, but barely considering those ideas, and by comparing them one with another, finding their agreement, and disagreement, and their several relations and habitudes; we shall get more true and clear knowledge, by the conduct

of this one rule, than by taking up principles, and thereby putting our minds into the disposal of others.

§7. The true method of advancing knowledge, is by considering our abstract ideas. We must therefore, if we will proceed, as reason advises, adapt our methods of inquiry to the nature of the ideas we examine, and the truth we search after. General and certain truths are only founded in the habitudes and relations of abstract ideas. A sagacious and methodical application of our thoughts, for the finding out these relations, is the only way to discover all, that can be put, with truth and certainty concerning them, into general propositions. By what steps we are to proceed in these, is to be learned in the schools of the mathematicians, who from very plain and easy beginnings, by gentle degrees, and a continued chain of reasonings, proceed to the discovery and demonstration of truths, that appear at first sight beyond human capacity. The art of finding proofs, and the admirable methods they have invented for the singling out, and laying in order those intermediate ideas, that demonstratively show the equality or inequality of unapplicable quantities, is that which has carried them so far, and produced such wonderful and unexpected discoveries: but whether something like this, in respect of other ideas, as well as those of magnitude, may not in time be found out, I will not determine. This, I think, I may say, that if other ideas, that are the real, as well as nominal essences of their species, were pursued in the way familiar to mathematicians, they would carry our thoughts further, and with greater evidence and clearness than possibly we are apt to imagine.

§8. By which, morality also may be made clearer. This gave me the confidence to advance that conjecture, which I suggest, chap. 3. viz. that morality is capable of demonstration, as well as mathematics. For the ideas that ethics are conversant about, being all real essences, and such as, I imagine, have a discoverable connexion and agreement one with another; so far as we can find their habitudes and relations, so far we shall be possessed of certain, real, and general truths: and I doubt not, but if a right method were taken, a great part of morality might be made out with that clearness, that could leave, to a considering man, no more reason to doubt, than he could have to doubt of the truth of propositions in mathematics, which have been demonstrated to him.

§9. But knowledge of bodies is to be improved only by experience. In our search after the knowledge of substances, our want of ideas, that are suitable to such a way of proceeding, obliges us to a quite different method. We advance not here, as in the other, (where our abstract ideas are real as well as nominal essences) by contemplating our ideas, and considering their relations and correspondences; that helps us very little, for the reasons, that in another place we have at large set down. By which, I think, it is evident, that substances afford matter of very little general knowledge; and the bare contemplation of their abstract ideas, will carry us but a very little way in the search of truth and certainty. What then are we to do for the improvement of our knowledge in substantial beings? Here we are to take a quite contrary course, the want of ideas of their real essences, sends us from our own thoughts, to the things themselves, as they exist. Experience here must teach me, what reason cannot: and 'tis by trying alone, that I can certainly know, what other qualities co-exist with those of my complex idea, v.g. whether that yellow, heavy, fusible body, I call gold, be malleable, or no; which experience (which way ever it prove in that particular body, I examine) makes me not certain, that 'tis so, in all, or any other yellow, heavy, fusible bodies, but that which I have tried. Because 'tis no consequence one way or the other from my complex idea; the necessity or inconsistency of malleability, hath no visible connexion with the combination of that colour, weight, and fusibility in any body. What I have said here of the nominal essence of gold, supposed to consist of a body of such a determinate colour, weight, and fusibility, will hold true, if malleableness, fixedness, and solubility in aqua regia be added to it. Our reasonings from these ideas will carry us but a little way in the certain discovery of the other properties in those masses of matter wherein all these are to be found. Because the other properties of such bodies, depending not on these, but on that unknown real essence, on which these also depend, we cannot by them discover the rest; we can go no further than the simple ideas of our nominal essence will carry us, which is very little beyond themselves; and so afford us but very sparingly any certain, universal, and useful truths. For, upon trial, having found that particular piece (and all others of that colour, weight, and fusibility, that I ever tried) malleable, that also makes now perhaps, a part of my complex idea, part of my nominal essence of gold: whereby though I make my complex idea, to which I affix the name gold, to consist of more simple ideas than before: yet still, it not containing the real essence of

any species of bodies, it helps me not certainly to know (I say to know, perhaps: it may be to conjecture) the other remaining properties of that body, further than they have a visible connexion, with some or all of the simple ideas, that make up my nominal essence. For example, I cannot be certain from this complex idea, whether gold be fixed or no; because, as before, there is no necessary connexion, or inconsistency to be discovered betwixt a complex idea of a body, yellow, heavy, fusible, malleable; betwixt these, I say, and fixedness, so that I may certainly know, that in whatsoever body these are found, there fixedness is sure to be. Here, again for assurance, I must apply myself to experience; as far as that reaches, I may have certain knowledge, but no further.

§10. This may procure us convenience, not science. I deny not, but a man accustomed to rational and regular experiments shall be able to see further into the nature of bodies, and guess righter at their yet unknown properties, than one, that is a stranger to them: but yet, as I have said, this is but judgment and opinion, not knowledge and certainty. This way of getting, and improving our knowledge in substances only by experience and history, which is all that the weakness of our faculties in this state of mediocrity, which we are in in this world, can attain to, makes me suspect, that natural philosophy is not capable of being made a science. We are able, I imagine, to reach very little general knowledge concerning the species of bodies, and their several properties. Experiments and historical observations we may have, from which we may draw advantages of ease and health, and thereby increase our stock of conveniences for this life: but beyond this, I fear our talents reach not, nor are our faculties, as I guess, able to advance.

§11. We are fitted for moral knowledge, and natural improvements. From whence 'tis obvious to conclude, that since our faculties are not fitted to penetrate into the internal fabric and real essences of bodies; but yet plainly discover to us the being of a God, and the knowledge of ourselves, enough to lead us into a full and clear discovery of our duty, and great concernment, it will become us, as rational creatures, to employ those faculties we have about what they are most adapted to, and follow the direction of nature, where it seems to point us out the way. For 'tis rational to conclude, that our proper employment lies in those inquiries, and in that sort of knowledge, which is most suited to our natural capacities, and carries

in it our greatest interest, i.e. the condition of our eternal estate. Hence I think I may conclude, that morality is the proper science, and business of mankind in general; (who are both concerned and fitted to search out their summum bonum,) as several arts, conversant about several parts of nature, are the lot and private talent of particular men, for the common use of human life, and their own particular subsistence in this world. Of what consequence the discovery of one natural body, and its properties may be to human life, the whole great continent of America is a convincing instance: whose ignorance in useful arts, and want of the greatest part of the conveniences of life, in a country that abounded with all sorts of natural plenty, I think, may be attributed to their ignorance, of what was to be found in a very ordinary despicable stone I mean the mineral of iron. And whatever we think of our parts or improvements in this part of the world, where knowledge and plenty seem to vie each with other; yet to anyone, that will seriously reflect on it, I suppose, it will appear past doubt, that were the use of iron lost among us, we should in a few ages be unavoidably reduced to the wants and ignorance of the ancient savage Americans, whose natural endowments and provisions come no way short of those of the most flourishing and polite nations. So that he who first made known the use of that contemptible mineral, may be truly styled the father of arts, and author of plenty.

§12. But must beware of hypotheses and wrong principles. I would not therefore, be thought to disesteem or dissuade the study of nature. I readily agree the contemplation of his works gives us occasion to admire, revere, and glorify their author: and if rightly directed, may be of greater benefit to mankind, than the monuments of exemplary charity, that have at so great charge been raised by the founders of hospitals and almshouses. He that first invented printing, discovered the use of the compass, or made public the virtue and right use of kin kina, did more for the propagation of knowledge, for the supply and increase of useful commodities, and saved more from the grave, than those who built colleges, workhouses, and hospitals. All that I would say, is, that we should not be too forwardly possessed with the opinion, or expectation of knowledge, where 'tis not to be had; or by ways that will not attain it: that we should not take doubtful systems, for complete sciences; nor unintelligible notions, for scientific demonstrations. In the knowledge of bodies, we must be content to glean, what we can, from particular experiments: since we cannot from a discovery of their real essences, grasp at a time whole

sheaves; and in bundles, comprehend the nature and properties of whole species together. Where our inquiry is concerning coexistence, or repugnancy to coexist, which by contemplation of our ideas we cannot discover; there experience, observation, and natural history, must give us by our senses, and by retail, an insight into corporeal substances. The knowledge of bodies we must get by our senses, warily employed in taking notice of their qualities and operations on one another: and what we hope to know of separate spirits in this world, we must, I think, expect only from revelation. He that shall consider, how little general maxims, precarious principles, and hypotheses laid down at pleasure, have promoted true knowledge, or helped to satisfy the inquiries of rational men after real improvements; how little, I say, the setting out at that end, has for many ages together advanced men's progress towards the knowledge of natural philosophy, will think, we have reason to thank those, who in this latter age have taken another course, and have trod out to us, though not an easier way to learned ignorance, yet a surer way to profitable knowledge.

§13. The true use of hypotheses. Not that we may not, to explain any phenomena of nature, make use of any probable hypotheses whatsoever: hypotheses, if they are well made, are at least great helps to the memory, and often direct us to new discoveries. But my meaning is, that we should not take up any one too hastily, (which the mind, that would always penetrate into the causes of things, and have principles to rest on, is very apt to do,) till we have very well examined particulars, and made several experiments, in that thing which we would explain by our hypothesis, and see whether it will agree to them all; whether our principles will carry us quite through, and not be as inconsistent with one phenomenon of nature, as they seem to accommodate, and explain another. And at least, that we take care, that the name of principles deceive us not, nor impose on us, by making us receive that for an unquestionable truth, which is really, at best, but a very doubtful conjecture, such as are most (I had almost said all) of the hypotheses in natural philosophy.

§14. Clear and distinct ideas with settled names, and the finding of those which show their agreement, or disagreement, are the ways to enlarge our knowledge. But whether natural philosophy be capable of certainty, or no, the ways to enlarge our knowledge, as far as we are capable, seem to me, in short, to be these two: First, the first is to

get and settle in our minds determined ideas of those things, whereof we have general or specific names; at least so many of them as we would consider and improve our knowledge in, or reason about. And if they be specific ideas of substances, we should endeavour also to make them as complete as we can, whereby I mean, that we should put together as many simple ideas, as being constantly observed to coexist, may perfectly determine the species; and each of those simple ideas, which are the ingredients of our complex one, should be clear and distinct in our minds. For it being evident, that our knowledge cannot exceed our ideas; as far as they are either imperfect, confused, or obscure, we cannot expect to have certain, perfect, or clear knowledge.

Secondly, the other is the art of finding out those intermediate ideas, which may show us the agreement, or repugnancy of other ideas, which cannot be immediately compared.

§15. Mathematics an instance of it. That these two (and not the relying on maxims, and drawing consequences from some general propositions) are the right methods of improving our knowledge in the ideas of other modes besides those of quantity, the consideration of mathematical knowledge will easily inform us. Where first we shall find, that he, that has not a perfect, and clear idea of those angles, or figures of which he desires to know anything, is utterly thereby uncapable of any knowledge about them. Suppose but a man, not to have a perfect exact idea of a right angle, a scalenum, or trapezium, and there is nothing more certain, than, that he will in vain seek any demonstration about them. Further, 'tis evident, that it was not the influence of those maxims, which are taken for principles in mathematics, that hath led the masters of that science into those wonderful discoveries they have made. Let a man of good parts know all the maxims generally made use of in mathematics never so perfectly, and contemplate their extent and consequences, as much as he pleases, he will by their assistance, I suppose, scarce ever come to know that the square of the hypotenuse in a rightangled triangle, is equal to the squares of the two other sides. The knowledge, that the whole is equal to all its parts, and if you take equals from equals, the remainder will be equal, etc. helped him not, I presume, to this demonstration: and a man may, I think, pore long enough on those axioms, without ever seeing one jot the more of mathematical truths. They have been discovered by the thoughts otherwise applied:

the mind had other objects, other views before it, far different from those maxims, when it first got the knowledge of such kind of truths in mathematics, which men well enough acquainted with those received axioms, but ignorant of their method, who first made these demonstrations, can never sufficiently admire. And who knows what methods, to enlarge our knowledge in other parts of science, may hereafter be invented, answering that of algebra in mathematics, which so readily finds out the ideas of quantities to measure others by, whose equality or proportion we could otherwise very hardly, or, perhaps, never come to know'

Chapter XIII Some further Considerations concerning our Knowledge

§1. Our knowledge partly necessary, partly voluntary. Our knowledge, as in other things, so in this, has so great a conformity with our sight, that 'tis neither wholly necessary, nor wholly voluntary. If our knowledge were altogether necessary, all men's knowledge would not only be alike, but every man would know all that is knowable: and if it were wholly voluntary, some men so little regard or value it, that they would have extreme little, or none at all. Men that have senses, cannot choose but receive some ideas by them; and if they have memory, they cannot but retain some of them; and if they have memory, they cannot but retain some of them; and if they have any distinguishing faculty, cannot but perceive the agreement, or disagreement of some of them one with another: as he that has eyes, if he will open them by day, cannot but see some objects: and perceive a difference in them. But though a man with his eyes open in the light, cannot but see; yet there be certain objects: which he may choose whether he will turn his eyes to; there may be in his reach a book containing pictures: and discourses, capable to delight: or instruct him, which yet he may never have the will to open, never take the pains to look into.

§2. The application voluntary; but we know as things are, not as we please. There is also another thing in a man's power, and that is, though he turns his eyes sometimes towards an object, yet he may choose whether he will curiously survey it, and with an intent application, endeavour to observe accurately all that is visible in it. But yet, what he does see, he cannot see otherwise than he does. It

depends not on his will to see that black, which appears yellow; nor to persuade himself that what actually scalds him, feels cold: The Earth will not appear painted with flowers, nor the fields covered with verdure, whenever he has a mind to it: in the cold winter, he cannot help seeing it white and hoary, if he will look abroad. Just thus is it with our understanding, all that is voluntary in our knowledge, is the employing, or withholding any of our faculties from this or that sort of objects, and a more or less accurate survey of them: but they being employed, our will hath no power to determine the knowledge of the mind one way or another; that is done only by the objects themselves, as far as they are clearly discovered. And therefore, as far as men's senses are conversant about external objects, the mind cannot but receive those ideas, which are presented by them, and be informed of the existence of things without: and so far as men's thoughts converse with their own determined ideas, they cannot but, in some measure, observe the agreement, and disagreement that is to be found amongst some of them, which is so far knowledge: and if they have names for those ideas which they have thus considered, they must needs be assured of the truth of those propositions, which express that agreement, or disagreement, they perceive in them, and be undoubtedly convinced of those truths. For what a man sees, he cannot but see; and what he perceives, he cannot but know that he perceives.

§3. Instance in numbers. Thus he that has got the ideas of numbers, and hath taken the pains to compare one, two, and three, to six, cannot choose but know that they are equal: he that hath got the idea of a triangle, and found the ways to measure its angles and their magnitudes, is certain that its three angles are equal to two right ones. And can as little doubt of that, as of this truth, that 'it is impossible for the same thing to be, and not to be'.

He also that hath the idea of an intelligent, but frail and weak being, made by and depending on another, who is eternal, omnipotent, perfectly wise and good, will as certainly know that man is to honour, fear, and obey God, as that the sun shines when he sees it. For if he hath but the ideas of two such beings in his mind, and will turn his thoughts that way, and consider them, he will as certainly find that the inferior, finite, and dependent, is under an obligation to obey the supreme and infinite, as he is certain to find, that three, four, and seven, are less than fifteen, if he will consider, and compute those

numbers; nor can he be surer in a clear morning that the sun is risen, if he will but open his eyes, and turn them that way. But yet these truths, being ever so certain, ever so clear, he may be ignorant of either, or all of them, who will never take the pains to employ his faculties, as he should, to inform himself about them.

Chapter XIV Of Judgment

§1. Our knowledge being short, we want something else. The understanding faculties being given to man, not barely for speculation, but also for the conduct of his life, man would be at a great loss, if he had nothing to direct him, but what has the certainty of true knowledge. For that being very short and scanty, as we have seen, he would be often utterly in the dark, and in most of the actions of his life, perfectly at a stand, had he nothing to guide him in the absence of clear and certain knowledge. He that will not eat, till he has demonstration that it will nourish him; he that will not stir, till he infallibly knows the business he goes about will succeed, will have little else to do, but to sit still and perish.

§2. What use to be made of this twilight state. Therefore as God has set some things in broad daylight; as he has given us some certain knowledge, though limited to a few things in comparison, probably, as a taste of what intellectual creatures are capable of, to excite in us a desire and endeavour after a better state: so in the greatest part of our concernments, he has afforded us only the twilight, as I may so say, of probability, suitable, I presume, to that state of mediocrity and probationership he has been pleased to place us in here; wherein to check our overconfidence and presumption, we might, by every day's experience be made sensible of our shortsightedness and liableness to error; the sense whereof might be a constant admonition to us, to spend the days of this our pilgrimage with industry and care, in the search, and following of that way, which might lead us to a state of greater perfection. It being highly rational to think, even were revelation silent in the case, that as men employ those talents, God has given them here, they shall accordingly receive their rewards at the close of the day, when their sun shall set, and night shall put an end to their labours.

§3. Judgment supplies the want of knowledge. The faculty, which God has given man to supply the want of clear and certain knowledge,

in cases where that cannot be had, is judgment: whereby, the mind takes its ideas to agree, or disagree; or, which is the same, any proposition to be true, or false, without perceiving a demonstrative evidence in the proofs. The mind sometimes exercises this judgment out of necessity, where demonstrative proofs and certain knowledge are not to be had; and sometimes out of laziness, unskilfulness, or haste, even where demonstrative and certain proofs are to be had. Men often stay not warily to examine the agreement or disagreement of two ideas, which they are desirous, or concerned to know; but either incapable of such attention, as is requisite in a long train of gradations, or impatient of delay, lightly cast their eyes on, or wholly pass by the proofs; and so without making out the demonstration, determine of the agreement or disagreement of two ideas, as it were by a view of them as they are at a distance, and take it to be the one or the other, as seems most likely to them upon such a loose survey. This faculty of the mind, when 'tis exercised immediately about things, is called judgment; when about truths delivered in words, is most commonly called assent or dissent: which being the most usual way, wherein the mind has occasion to employ this faculty, I shall, under these terms treat of it, as least liable in our language to equivocation.

§4. Judgement is the presuming things to be so without perceiving it. Thus the mind has two faculties conversant about truth and falsehood:

First, knowledge, whereby it certainly perceives, and is undoubtedly satisfied of the agreement or disagreement of any ideas.

Secondly, judgment, which is the putting ideas together, or separating them from one another in the mind, when their certain agreement or disagreement is not perceived, but presumed to be so; which is, as the word imports, taken to be so before it certainly appears. And if it so unites, or separates them, as in reality things are, 'tis right judgment.

Chapter XV Of Probability

§1. Probability is the appearance of agreement upon fallible proofs. As demonstration is the showing the agreement, or disagreement of two ideas, by the intervention of one or more proofs,

which have a constant, immutable, and visible connexion one with another:so probability is nothing but the appearance of such an agreement,or disagreement, by the intervention of proofs, whose connexion is not constant and immutable, or at least is not perceived to be so, but is, or appears for the most part to be so, and is enough to induce the mind to judge the proposition to be true, or false, rather than the contrary. For example: in the demonstration of it, a man perceives the certain, immutable connexion there is of equality,between the three angles of a triangle, and those intermediate ones which are made use of to show their equality to two right ones; and so, by an intuitive knowledge of the agreement, or disagreement, of the intermediate ideas in each step of the progress, the whole series is continued with an evidence, which clearly shows the agreement or disagreement of those three angles in equality to two right ones:and thus he has certain knowledge that 'tis so. But another man who never took the pains to observe the demonstration, hearing a mathematician, a man of credit, affirm the three angles of a triangle,to be equal to two right ones, assents to it, i.e. receives it for true.In which case, the foundation of his assent is the probability of the thing, the proof being such, as for the most part carries truth with it:the man, on whose testimony he receives it, not being wont to affirm anything contrary to, or besides his knowledge, especially in matters of this kind. So that that which causes his assent to this proposition,that the three angles of a triangle are equal to two right ones, that which makes him take these ideas to agree, without knowing them to do so, is the wonted veracity of the speaker in other cases, or his supposed veracity in this.

§2. 'Tis to supply the want of knowledge. Our knowledge, as has been shown, being very narrow, and we not happy enough to find certain truth in everything which we have occasion to consider;most of the propositions we think, reason, discourse, nay act upon,are such, as we cannot have undoubted knowledge of their truth: yet some of them border so near upon certainty, that we make no doubt at all about them; but assent to them as firmly, and act, according to that assent, as resolutely, as if they were infallibly demonstrated,and that our knowledge of them was perfect and certain. But there being degrees herein, from the very neighbourhood of certainty and demonstration, quite down to improbability and unlikeness, even to the confines of impossibility; and also degrees of assent from full assurance and confidence, quite down to conjecture, doubt, and

distrust. I shall come now, (having, as I think, found out the bounds of human knowledge and certainty,) in the next place, to consider the several degrees and grounds of probability, and assent or faith.

§3. Being that which makes us presume things to be true, before we know them to be so. Probability is likeliness to be true, the very notation of the word signifying such a proposition, for which there be arguments or proofs to make it pass, or be received for true. The entertainment the mind gives this sort of propositions, is called belief, assent, or opinion, which is the admitting or receiving any proposition for true, upon arguments or proofs that are found to persuade us to receive it as true, without certain knowledge that 'tis so. And herein lies the difference between probability and certainty, faith and knowledge, that in all the parts of knowledge, there is intuition; each immediate idea, each step has its visible and certain connexion; in belief not so. That which makes me believe, is something extraneous to the thing I believe; something not evidently joined on both sides to, and so not manifestly showing the agreement, or disagreement of those ideas, that are under consideration.

§4. The grounds of probability are two: conformity with our own experience, or the testimony of others' experience. Probability then, being to supply the defect of our knowledge, and to guide us where that fails, is always conversant about propositions, whereof we have no certainty, but only some inducements to receive them for true. The grounds of it are, in short, these two following: First, The conformity of anything with our own knowledge, observation, and experience.

Secondly, The testimony of others, vouching their observation and experience. In the testimony of others, is to be considered, 1. The number. 2. The integrity. 3. The skill of the witnesses. 4. The design of the author, where 'tis a testimony out of a book cited. 5. The consistency of the parts, and circumstances of the relation. 6. Contrary testimonies.

§5. In this all the arguments pro and con ought to be examined, before we come to a judgment. Probability wanting that intuitive evidence, which infallibly determines the understanding and produces certain knowledge, the mind if it will proceed rationally, ought to examine all the grounds of probability, and see how they make more or less, for or against any probable proposition, before it assents to or dissents from it, and, upon a due balancing the whole,

reject or receive it, with a more or less firm assent, proportionably to the preponderancy of the greater grounds of probability on one side or the other. For example: If I myself see a man walk on the ice, 'tis past probability, 'tis knowledge: but if another tells me he saw a man in England in the midst of a sharp winter, walk upon water hardened with cold; this has so great conformity with what is usually observed to happen, that I am disposed by the nature of the thing itself to assent to it, unless some manifest suspicion attend the relation of that matter of fact. But if the same thing be told to one born between the tropics, who never saw nor heard of any such thing before, there the whole probability relies on testimony: and as the relators are more in number, and of more credit, and have no interest to speak contrary to the truth; so that matter of fact is like to find more or less belief. Though to a man, whose experience has been always quite contrary, and who has never heard of anything like it, the most untainted credit of a witness will scarce be able to find belief. And as it happened to a Dutch ambassador, who entertaining the king of Siam with the particularities of Holland, which he was inquisitive after, amongst other things told him, that the water in his country, would sometimes, in cold weather, be so hard, that men walked upon it, and that it would bear an elephant, if he were there. To which the King replied, 'Hitherto I have believed the strange things you have told me, because I look upon you as a sober fair man, but now I am sure you lie'.

§6. They being capable of great variety. Upon these grounds depends the probability of any proposition: and as the conformity of our knowledge, as the certainty of observations, as the frequency and constancy of experience, and the number and credibility of testimonies, do more or less agree, or disagree with it, so is any proposition in itself, more or less probable. There is another, I confess, which though by itself it be no true ground of probability, yet is often made use of for one, by which men most commonly regulate their assent, and upon which they pin their faith more than anything else, and that is, the opinion of others; though there cannot be a more dangerous thing to rely on, nor more likely to mislead one; since there is much more falsehood and error among men, than truth and knowledge. And if the opinions and persuasions of others, whom we know and think well of, be a ground of assent, men have reason to be heathens in Japan, Mahometans in Turkey, Papists in Spain, Protestants in England, and Lutherans in Sweden. But of this wrong

ground of assent, I shall have occasion to speak more at large in another place.

Chapter XVI Of the Degrees of Assent

§1. Our assent ought to be regulated by the grounds of probability. The grounds of probability we have laid down in the foregoing chapter: as they are the foundations on which our assent is built, so are they also the measure whereby its several degrees are, or ought to be regulated: only we are to take notice that, whatever grounds of probability there may be, they yet operate no further on the mind which searches after truth, and endeavours to judge right, than they appear; at least, in the first judgment or search that the mind makes. I confess, in the opinions men have, and firmly stick to in the world, their assent is not always from an actual view of the reasons that at first prevailed with them: it being in many cases almost impossible, and in most, very hard, even for those who have very admirable memories, to retain all the proofs, which upon a due examination, made them embrace that side of the question. It suffices that they have once with care and fairness sifted the matter as far as they could; and that they have searched into all the particulars, that they could imagine to give any light to the question; and with the best of their skill, cast up the account upon the whole evidence: and thus, having once found on which side the probability appeared to them, after as full and exact an inquiry as they can make, they lay up the conclusion in their memories as a truth they have discovered; and for the future they remain satisfied with the testimony of their memories, that this is the opinion, that by the proofs they have once seen of it, deserves such a degree of their assent as they afford it.

§2. These cannot always be actually in view; and then we must content ourselves with the remembrance that we once saw ground for such a degree of assent. This is all that the greatest part of men are capable of doing, in regulating their opinions and judgments; unless a man will exact of them, either to retain distinctly in their memories all the proofs concerning any probable truth, and that too in the same order, and regular deduction of consequences in which they have formerly placed or seen them; which sometimes is enough to fill a large volume upon one single question: or else they must require a man, for every opinion that he embraces, every day to examine the proofs: both which are impossible. 'Tis unavoidable, therefore, that

the memory be relied on in the case, and that men be persuaded of several opinions, whereof the proofs are not actually in their thoughts; nay, which perhaps they are not able actually to recall. Without this, the greatest part of men must be either very sceptic; or change every moment, and yield themselves up to whoever, having lately studied the question, offers them arguments, which, for want of memory, they are not able presently to answer.

§3. The ill consequence of this, if our former judgments were not rightly made. I cannot but own, that men's sticking to their past judgment, and adhering firmly to conclusions formerly made, is often the cause of great obstinacy in error and mistake. But the fault is not that they rely on their memories, for what they have before well judged; but because they judged before they had well examined. May we not find a great number (not to say the greatest part) of men, that think they have formed right judgments of several matters; and that for no other reason, but because they never thought otherwise 'that imagine themselves to have judged right, only because they never questioned, never examined their own opinions' Which is indeed to think they judged right, because they never judged at all: and yet these of all men, hold their opinions with the greatest stiffness; those being generally the most fierce and firm in their tenets, who have least examined them. What we once know, we are certain is so: and we may be secure, that there are no latent proofs undiscovered, which may overturn our knowledge, or bring it in doubt. But in matters of probability, 'tis not in every case we can be sure, that we have all the particulars before us, that any way concern the question; and that there is no evidence behind, and yet unseen, which may cast the probability on the other side, and outweigh all, that at present seems to preponderate with us. Who almost is there that hath the leisure, patience, and means, to collect together all the proofs concerning most of the opinions he has, so as safely to conclude, that he hath a clear and full view; and that there is no more to be alleged for his better information' And yet we are forced to determine ourselves on the one side or other. The conduct of our lives, and the management of our great concerns, will not bear delay: for those depend, for the most part, on the determination of our judgment in points wherein we are not capable of certain and demonstrative knowledge, and wherein 'tis necessary for us to embrace the one side, or the other.

§4. The right use of it mutual charity and forbearance. Since

therefore 'tis unavoidable to the greatest part of men, if not all, to have several opinions, without certain and indubitable proofs of their truth; and it carries too great an imputation of ignorance, lightness, or folly for men to quit and renounce their former tenets, presently upon the offer of an argument, which they cannot immediately answer, and show the insufficiency of: it would, methinks, become all men to maintain peace, and the common offices of humanity, and friendship, in the diversity of opinions, since we cannot reasonably expect, that anyone should readily and obsequiously quit his own opinion, and embrace ours with a blind resignation to an authority which the understanding of man acknowledges not. For however it may often mistake, it can own no other guide but reason, nor blindly submit to the will and dictates of another. If he, you would bring over to your sentiments, be one that examines before he assents, you must give him leave at his leisure, to go over the account again, and, recalling what is out of his mind, examine all the particulars, to see on which side the advantage lies: and if he will not think our arguments of weight enough to engage him anew in so much pains, 'tis but what we do often ourselves in the like case; and we should take it amiss, if others should prescribe to us what points we should study. And if he be one who takes his opinions upon trust, how can we imagine that he should renounce those tenets, which time and custom have so settled in his mind, that he thinks them self-evident, and of an unquestionable certainty; or which he takes to be impressions he has received from God Himself, or from men sent by him? How can we expect, I say, that opinions thus settled should be given up to the arguments or authority of a stranger, or adversary, especially if there be any suspicion of interest, or design, as there never fails to be, where men find themselves ill treated? We should do well to commiserate our mutual ignorance, and endeavour to remove it in all the gentle and fair ways of information; and not instantly treat others ill, as obstinate and perverse, because they will not renounce their own, and receive our opinions, or at least those we would force upon them, when 'tis more than probable, that we are no less obstinate in not embracing some of theirs. For where is the man, that has uncontestable evidence of the truth of all that he holds, or of the falsehood of all he condemns; or can say, that he has examined, to the bottom, all his own, or other men's opinions? The necessity of believing, without knowledge, nay, often upon very slight grounds, in this fleeting state of action and blindness we are in, should make us more busy and careful to inform ourselves, than constrain others. At least those, who have not

thoroughly examined to the bottom all their own tenets, must confess, they are unfit to prescribe to others; and are unreasonable in imposing that as truth on other men's belief, which they themselves have not searched into, nor weighed the arguments of probability, on which they should receive or reject it. Those who have fairly and truly examined, and are thereby got past doubt in all the doctrines they profess, and govern themselves by, would have a juster pretence to require others to follow them: but these are so few in number, and find so little reason to be magisterial in their opinions, that nothing insolent and imperious is to be expected from them: and there is reason to think, that if men were better instructed themselves, they would be less imposing on others.

§5. Probability is either of matter of fact or speculation. But to return to the grounds of assent, and the several degrees of it, we are to take notice, that the propositions we receive upon inducements of probability, are of two sorts; either concerning some particular existence, or, as 'tis usually termed, matter of fact, which falling under observation, is capable of human testimony or else concerning things, which being beyond the discovery of our senses, are not capable of any such testimony.

§6. The concurrent experience of all other men with ours, produces assurance approaching to knowledge. Concerning the first of these, viz. Particular matter of fact,

First, Where any particular thing, consonant to the constant observation of ourselves and others in the like case, comes attested by the concurrent reports of all that mention it, we receive it as easily, and build as firmly upon it, as if it were certain knowledge; and we reason and act thereupon with as little doubt as if it were perfect demonstration. Thus, if all Englishmen, who have occasion to mention it, should affirm that it froze in England the last winter, or that there were swallows seen there in the summer, I think a man could almost as little doubt of it, as that seven and four are eleven. The first therefore, and highest degree of probability, is, when the general consent of all men, in all ages, as far as it can be known, concurs with a man's constant and never-failing experience in like cases, to confirm the truth of any particular matter of fact attested by fair witnesses: such are all the stated constitutions and properties of bodies, and the regular proceedings of causes and effects in the ordinary course of

nature. This we call an argument from the nature of things themselves. For what our own and other men's constant observation has found always to be after the same manner, that we with reason conclude to be the effect of steady and regular causes, though they come not within the reach of our knowledge. Thus, that fire warmed a man, made lead fluid, and changes the colour or consistency in wood or charcoal: that iron sunk in water, and swam in quicksilver: these and the like propositions about particular facts, being agreeable to our constant experience, as often as we have to do with these matters; and being generally spoke of, (when mentioned by others,) as things found constantly to be so, and therefore not so much as controverted by anybody, we are put past doubt that a relation affirming any such thing to have been, or any prediction that it will happen again in the same manner, is very true. These probabilities rise so near to certainty, that they govern our thoughts as absolutely, and influence all our actions as fully, as the most evident demonstration: and in what concerns us, we make little or no difference between them and certain knowledge: our belief thus grounded, rises to assurance.

§7. Unquestionable testimony and experience for the most part produce confidence. Secondly, The next degree of probability is, when I find by my own experience, and the agreement of all others that mention it, a thing to be, for the most part, so; and that the particular instance of 'tis attested by many and undoubted witnesses, v.g. history giving us such an account of men in all ages; and my own experience, as far as I had an opportunity to observe, confirming it, that most men prefer their private advantage, to the public. If all historians that write of Tiberius, say that Tiberius did so, 'tis extremely probable. And in this case, our assent has a sufficient foundation to raise itself to a degree, which we may call confidence.

§8. Fair testimony, and the nature of the thing indifferent, produces also confident belief. Thirdly, in things that happen indifferently, as that a bird should fly this or that way; that it should thunder on a man's right or left hand, etc. when any particular matter of fact is vouched by the concurrent testimony of unsuspected witnesses, there our assent is also unavoidable. Thus: that there is such a city in Italy as Rome: that about 1700 years ago, there lived in it a man, called Julius Caesar; that he was a general, and that he won a battle against another called Pompey. This, though in the nature of the thing, there be nothing for, nor against it, yet, being related by

historians of credit, and contradicted by no one writer, a man cannot avoid believing it, and can as little doubt of it, as he does of the being and actions of his own acquaintance, whereof he himself is a witness.

§9. Experience and testimonies clashing, infinitely vary the degrees of probability. Thus far the matter goes easy enough. Probability upon such grounds carries so much evidence with it, that it naturally determines the judgment, and leaves us as little liberty to believe, or disbelieve, as a demonstration does, whether we will know, or be ignorant. The difficulty is, when testimonies contradict common experience, and the reports of history and witnesses clash with the ordinary course of nature, or with one another; there it is, where diligence, attention, and exactness is required, to form a right judgment, and to proportion the assent to the different evidence and probability of the thing; which rises and falls, according as those two foundations of credibility, viz. common observation in like cases, and particular testimonies in that particular instance, favour or contradict it. These are liable to so great variety of contrary observations, circumstances, reports, different qualifications, tempers, designs, oversights, etc. of the reporters, that 'tis impossible to reduce to precise rules, the various degrees wherein men give their assent. This only may be said in general, That as the arguments and proofs pro, and con, upon due examination, nicely weighing every particular circumstance, shall to anyone appear, upon the whole matter, in a greater or less degree, to preponderate on either side, so they are fitted to produce in the mind such different entertainments, as we call belief, conjecture, guess, doubt, wavering, distrust, disbelief, etc.

§10. Traditional testimonies, the further removed, the less their proof. This is what concerns assent in matters wherein testimony is made use of: concerning which, I think, it may not be amiss to take notice of a rule observed in the law of England; which is, That though the attested copy of a record be good proof, yet the copy of a copy never so well attested, and by ever so credible witnesses, will not be admitted as a proof in judicature. This is so generally approved as reasonable, and suited to the wisdom and caution to be used in our inquiry after material truths, that I never yet heard of anyone that blamed it. This practice, if it be allowable in the decisions of right and wrong, carries this observation along with it, viz., that any testimony, the further off 'tis from the original truth, the less force and proof it has. The being and existence of the thing itself, is what I call the

original truth. A credible man vouching his knowledge of 'tis a good proof: but if another equally credible, do witness it from his report, the testimony is weaker; and a third that attests from hearsay of an hearsay, is yet less considerable. So that in traditional truths, each remove weakens the force of the proof: and the more hands the tradition has successively passed through, the less strength and evidence does it receive from them. This I thought necessary to be taken notice of: because I find amongst some men, the quite contrary commonly practised, who look on opinions to gain force by growing older; and what a thousand years since would not, to a rational man, contemporary with the first voucher, have appeared at all probable, is now urged as certain beyond all question, only because several have since, from him, said it one after another. Upon this ground propositions, evidently false or doubtful enough in their first beginning, come by an inverted rule of probability, to pass for authentic truths; and those which found or deserved little credit from the mouths of their first authors, are thought to grow venerable by age, and are urged as undeniable.

§11. Yet history is of great use. I would not be thought here to lessen the credit and use of history: 'tis all the light we have in many cases, and we have in many cases; and we receive from it a great part of the useful truths we have, with a convincing evidence. I think nothing more valuable than the records of antiquity: I wish we had more of them, and more uncorrupted. But this truth itself forces me to say, that no probability can arise higher than its first original. What has no other evidence than the single testimony of one only witness, must stand or fall by his only testimony, whether good, bad, or indifferent; and though cited afterwards by hundreds of others, one after another, is so far from receiving any strength thereby, that 'tis only the weaker. Passion, interest, inadvertency, mistake of his meaning, and a thousand odd reasons, or capricios, men's minds are acted by, (impossible to be discovered,) may make one man quote another man's words or meaning wrong. He that has but ever so little examined the citations of writers, cannot doubt how little credit the quotations deserve, where the originals are wanting; and consequently how much less quotations of quotations can be relied on. This is certain, that what in one age was affirmed upon slight grounds, can never after come to be more valid in future ages, by being often repeated. But the further still 'tis from the original, the less valid it is, and has always less force in the mouth, or writing of him that last

made use of it, than in his from whom he received it.

§12. In things which sense cannot discover, analogy is the great rule of probability. The probabilities we have hitherto mentioned, are only such as concern matter of fact, and such things as are capable of observation and testimony. There remains that other sort concerning which, men entertain opinions with variety of assent, though the things be such, that falling not under the reach of our senses, they are not capable of testimony. Such are, 1. the existence, nature and operations of finite immaterial beings without us; as spirits, angels, devils, etc. Or the existence of material beings; which either for their smallness in themselves, or remoteness from us, our senses cannot take notice of, as whether there be any plants, animals, and intelligent inhabitants in the planets, and other mansions of the vast universe. 2. Concerning the manner of operation in most parts of the works of nature: wherein though we see the sensible effects, yet their causes are unknown, and we perceive not the ways and manner how they are produced. We see animals are generated, nourished, and move; the loadstone draws iron; and the parts of a candle successively melting, turn into flame, and give us both light and heat. These and the like effects we see and know: but the causes that operate, and the manner they are produced in, we can only guess, and probably conjecture. For these and the like coming not within the scrutiny of human senses, cannot be examined by them, or be attested by anybody, and therefore can appear more or less probable, only as they more or less agree to truths that are established in our minds, and as they hold proportion to other parts of our knowledge and observation. Analogy in these matters is the only help we have, and 'tis from that alone we draw all our grounds of probability. Thus observing that the bare rubbing of two bodies violently one upon another, produces heat, and very often fire itself, we have reason to think, that what we call heat and fire, consists in a violent agitation of the imperceptible minute parts of the burning matter: observing likewise that the different refractions of pellucid bodies produce in our eyes the different appearances of several colours; and also that the different ranging and laying the superficial parts of several bodies, as of velvet, watered silk, etc. does the like, we think it probable that the colour and shining of bodies, is in them nothing but the different arrangement and refraction of their minute and insensible parts. Thus finding in all parts of the creation, that fall under human observation, that there is a gradual connexion of one with another, without any great or discernible gaps between, in

all that great variety of things we see in the world, which are so closely linked together, that, in the several ranks of beings, 'tis not easy to discover the bounds betwixt them, we have reason to be persuaded, that by such gentle steps things ascend upwards in degrees of perfection.'Tis a hard matter to say where sensible and rational begin, and where insensible and irrational end: and who is there quicksighted enough to determine precisely, which is the lowest species of living things, and which the first of those which have no life' Things, as far as we can observe, lessen, and augment, as the quantity does in a regular cone, where though there be a manifest odds betwixt the bigness of the diameter at remote distance: yet the difference between the upper and under, where they touch one another, is hardly discernible. The difference is exceeding great between some men, and some animals: but if we will compare the understanding and abilities of some men, and some brutes, we shall find so little difference, that 'twill be hard to say, that that of the man is either clearer or larger. Observing, I say, such gradual and gentle descents downwards in those parts of the creation, that are beneath man, the rule of analogy may make it probable, that 'tis so also in things above us, and our observation; and that there are several ranks of intelligent beings, excelling us in several degrees of perfection, ascending upwards towards the infinite perfection of the creator, by gentle steps and differences, that are every one at no great distance from the next to it. This sort of probability, which is the best conduct of rational experiments, and the rise of hypothesis, has also its use and influence; and a wary reasoning from analogy leads us often into the discovery of truths and useful productions, which would otherwise lie concealed.

§13. One case where contrary experience lessens not the testimony. Though the common experience, and the ordinary course of things have justly a mighty influence on the minds of men, to make them give or refuse credit to anything proposed to their belief; yet there is one case, wherein the strangeness of the fact lessens not the assent to a fair testimony given of it. For where such supernatural events are suitable to ends aimed at by him, who has the power to change the course of nature, there, under such circumstances, that may be the fitter to procure belief, by how much the more they are beyond, or contrary to ordinary observation. This is the proper case of miracles, which, well attested, do not only find credit themselves; but give it also to other truths, which need such confirmation.

§14. The bare testimony of revelation is the highest certainty. Besides those we have hitherto mentioned, there is one sort of propositions that challenge the highest degree of our assent, upon bare testimony, whether the thing proposed, agree or disagree with common experience, and the ordinary course of things, or no. The reason whereof is, because the testimony is of such an one, as cannot deceive, nor be deceived, and that is of God himself. This carries with it assurance beyond doubt, evidence beyond exception. This is called by a peculiar name, revelation, and our assent to it, faith: which as absolutely determines our minds, and as perfectly excludes all wavering as our knowledge itself; and we may as well doubt of our own being, as we can, whether any revelation from God be true. So that faith is a settled and sure principle of assent and assurance, and leaves no manner of room for doubt or hesitation. Only we must be sure, that it be a divine revelation, and that we understand it right: else we shall expose ourselves to all the extravagancy of enthusiasm, and all the error of wrong principles, if we have faith and assurance in what is not divine revelation. And therefore in those cases, our assent can be rationally no higher than the evidence of its being a revelation, and that this is the meaning of the expressions 'tis delivered in. If the evidence of its being a revelation, or that this is its true sense be only on probable proofs, our assent can reach no higher than an assurance or diffidence, arising from the more, or less apparent probability of the proofs. But of faith, and the precedency it ought to have before other arguments of persuasion, I shall speak more hereafter, where I treat of it, as 'tis ordinarily placed, in contradistinction to reason; though in truth, it be nothing else but an assent founded on the highest reason.

Chapter XVII Of Reason

§1. Various significations of the word reason. The word reason in the English language has different significations: sometimes 'tis taken for true, and clear principles: sometimes for clear and fair deductions from those principles: and sometimes for the cause, and particularly the final cause. But the consideration I shall have of it here is in a signification different from all these; and that is, as it stands for a faculty in man, that faculty, whereby man is supposed to be distinguished from beasts, and wherein 'tis evident he much surpasses

them.

§2. Wherein reasoning consists. If general knowledge, as has been shown, consists in a perception of the agreement, or disagreement of our own ideas; and the knowledge of the existence of all things without us (except only of a God, whose existence every man may certainly know and demonstrate to himself from his own existence) be had only by our senses: what room then is there for the exercise of any other faculty, but outward sense and inward perception? What need is there of reason? Very much; both for the enlargement of our knowledge, and regulating our assent: for it hath to do, both in knowledge and opinion, and is necessary, and assisting to all our other intellectual faculties, and indeed contains two of them, viz. sagacity and illation. By the one, it finds out, and by the other, it so orders the intermediate ideas, as to discover what connexion there is in each link of the chain, whereby the extremes are held together; and thereby, as it were, to draw into view the truth sought for, which is that we call illation or inference, and consists in nothing but the perception of the connexion there is between the ideas, in each step of the deduction, whereby the mind comes to see, either the certain agreement or disagreement of any two ideas as in demonstration, in which it arrives at knowledge; or their probable connexion, on which it gives or withholds its assent, as in opinion. Sense and intuition reach but a very little way. The greatest part of our knowledge depends upon deductions and intermediate ideas: and in those cases, where we are fain to substitute assent instead of knowledge, and take propositions for true, without being certain they are so, we have need to find out, examine, and compare the grounds of their probability. In both these cases, the faculty which finds out the means, and rightly applies them to discover certainty in the one, and probability in the other, is that which we call reason. For as reason perceives the necessary, and indubitable connexion of all the ideas or proofs one to another, in each step of any demonstration that produces knowledge: so it likewise perceives the probable connexion of all the ideas or proofs one to another, in every step of a discourse, to which it will think assent due. This is the lowest degree of that, which can be truly called reason. For where the mind does not perceive this probable connexion; where it does not discern, whether there be any such connexion; or no, there men's opinions are not the product of judgment, or the consequence of reason; but the effects of chance and hazard, of a mind floating at all adventures, without choice, and

without direction.

§3. Its four parts. So that we may in reason consider these four degrees: the first and highest, is the discovering, and finding out of proofs; the second, the regular and methodical disposition of them, and laying them in a clear and fit order, to make their connexion and force be plainly and easily perceived; the third is the perceiving their connexion; and the fourth, a making a right conclusion. These several degrees may be observed in any mathematical demonstration: it being one thing to perceive the connexion of each part, as the demonstration is made by another; another to perceive the dependence of the conclusion on all the parts; a third to make out a demonstration clearly and neatly oneself, and something different from all these, to have first found out these intermediate ideas or proofs by which 'tis made.

§4. Syllogism not the great instrument of reason. There is one thing more, which I shall desire to be considered concerning reason; and that is, whether syllogism, as is generally thought, be the proper instrument of it, and the usefulest way of exercising this faculty. The causes I have to doubt, are these.

First, Because syllogism serves our reason, but in one only of the forementioned parts of it; and that is, to show the connexion of the proofs in any one instance, and no more: but in this 'tis of no great use, since the mind can perceive such connexion where it really is, as easily, nay, perhaps, better without it.

If we will observe the actings of our own minds, we shall find, that we reason best and clearest, when we only observe the connexion of the proof, without reducing our thoughts to any rule of syllogism. And therefore we may take notice, that there are many men that reason exceeding clear and rightly, who know not how to make a syllogism. He that will look into many parts of Asia and America, will find men reason there, perhaps as acutely as himself, who yet never heard of a syllogism, nor can reduce any one argument to those forms: and I believe scarce anyone ever makes syllogisms in reasoning within himself. Indeed syllogism is made use of on occasion to discover a fallacy hid in a rhetorical flourish, or cunningly wrapped up in a smooth period; and stripping an absurdity of the cover of wit, and good language, show it in its naked deformity. But the weakness or fallacy of such a loose discourse it shows, by the artificial form 'tis put

into, only to those who have thoroughly studied mode and figure, and have so examined the many ways, that three propositions may be put together, as to know which of them does certainly conclude right, and which not, and upon what grounds 'tis that they do so. All who have so far considered syllogism, as to see the reason, why, in three propositions laid together in one form, the conclusion will be certainly right, but in another, not certainly so, I grant are certain of the conclusion they draw from the premises in the allowed modes and figures: but they who have not so far looked into those forms, are not sure by virtue of syllogism, that the conclusion certainly follows from the premises; they only take it to be so by an implicit faith in their teachers, and a confidence in those forms of argumentation; but this is still but believing, not being certain. Now, if of all mankind, those who can make syllogisms are extremely few in comparison of those who cannot, and if of those few who have been taught logic, there is but a very small number, who do any more than believe that syllogisms in the allowed modes and figures do conclude right, without knowing certainly that they do so; if syllogisms must be taken for the only proper instrument of reason and means of knowledge, it will follow, that before Aristotle there was not one man that did or could know anything by reason; and that since the invention of syllogisms, there is not one of ten thousand that doth.

But God has not been so sparing to men to make them barely two-legged creatures, and left it to Aristotle to make them rational, i.e. those few of them that he could get so to examine the grounds of syllogisms, as to see, that in above three score ways, that three propositions may be laid together, there are but about fourteen wherein one may be sure that the conclusion is right, and upon what ground it is, that in these few the conclusion is certain, and in the other not. God has been more bountiful to mankind than so. He has given them a mind that can reason without being instructed in methods of syllogizing: the understanding is not taught to reason by these rules; it has a native faculty to perceive the coherence, or incoherence of its ideas, and can range them right, without any such perplexing repetitions. I say not this any way to lessen Aristotle, whom I look on as one of the greatest men amongst the ancients; whose large views, acuteness and penetration of thought, and strength of judgment, few have equalled: and who in this very invention of forms of argumentation, wherein the conclusion may be shown to be rightly inferred, did great service against those, who were not

ashamed to deny anything. And I readily own, that all right reasoning may be reduced to his forms of syllogism. But yet I think, without any diminution to him I may truly say, that they are not the only, nor the best way of reasoning, for the leading of those into truth who are willing to find it, and desire to make the best use they may of their reason, for the attainment of knowledge. And he himself 'tis plain, found out some forms to be conclusive, and others not, not by the forms themselves but by the original way of knowledge, i.e. by the visible agreement of ideas. Tell a country gentlewoman, that the wind is southwest, and the weather lowering, and like to rain, and she will easily understand 'tis not safe for her to go abroad thin clad, in such a day, after a fever: she clearly sees the probable connexion of all these, viz. south-west wind, and clouds, rain, wetting, taking cold, relapse, and danger of death, without tying them together in those artificial and cumbersome fetters of several syllogisms, that clog and hinder the mind, which proceeds from one part to another quicker and clearer without them: and the probability which she easily perceives in things thus in their native state, would be quite lost, if this argument were managed learnedly, and proposed in mode and figure. For it very often confounds the connexion: and, I think, everyone will perceive in mathematical demonstrations, that the knowledge gained thereby, comes shortest and clearest without syllogism.

Inference is looked on as the great act of the rational faculty, and so 'tis when 'tis rightly made; but the mind, either very desirous to enlarge its knowledge, or very apt to favour the sentiments it has once imbibed, is very forward to make inferences, and therefore often makes too much haste, before it perceives the connexion of the ideas that must hold the extremes together.

To infer is nothing but by virtue of one proposition laid down as true, to draw in another as true, i.e. to see or suppose such a connexion of the two ideas, of the inferred proposition. v.g. let this be the proposition laid down, 'Men shall be punished in another world', and from thence be inferred this other, 'Then men can determine themselves'. The question now is to know, whether the mind has made this inference right or no; if it has made it by finding out the intermediate ideas, and taking a view of the connexion of them, placed in a due order, it has proceeded rationally, and made a right inference. If it has done it without such a view, it has not so much made an inference that will hold, or an inference of right reason, as

shown a willingness to have it be, or be taken for such. But in neither case is it syllogism that discovered those ideas, or showed the connexion of them, for they must be both found out, and the connexion everywhere perceived, before they can rationally be made use of in syllogism: unless it can be said, that any idea without considering what connexion it hath with the two other, whose agreement should be shown by it, will do well enough in a syllogism, and may be taken at a venture for the medius terminus, to prove any conclusion. But this nobody will say, because 'tis by virtue of the perceived agreement of the intermediate idea with the extremes, that the extremes are concluded to agree, and therefore each intermediate idea must be such, as in the whole chain hath a visible connexion with those two it is placed between, or else thereby, the conclusion cannot be inferred or drawn in; for wherever any link of the chain is loose, and without connexion, there the whole strength of 'tis lost, and it hath no force to infer or draw in anything. In the instance above-mentioned, what is it shows the force of the inference, and consequently the reasonableness of it, but a view of the connexion of all the intermediate ideas that draw in the conclusion, or proposition inferred. v.g. Men shall be punished, —God the punisher, —just punishment, —the punished guilty—could have done otherwise—freedom—self-determination, by which chain of ideas thus visibly linked together in train, i.e. each intermediate idea agreeing on each side with those two 'tis immediately placed between, the ideas of men and self-determination appear to be connected, i.e. this proposition men can determine themselves is drawn in, or inferred from this that they shall be punished in the other world. For here the mind seeing the connexion there is between the idea of men's punishment in the other world, and the idea of God punishing, between God punishing, and the justice of the punishment; between justice of punishment and guilt, between guilt and a power to do otherwise, between a power to do otherwise and freedom, and between freedom and self-determination, sees the connexion between men, and self-determination.

Now I ask whether the connexion of the extremes be not more clearly seen in this simple and natural disposition, than in the perplexed repetitions, and jumble of five or six syllogisms. I must beg pardon for calling it jumble, till somebody shall put these ideas into so many syllogisms, and then say, that they are less jumbled, and their connexion more visible, when they are transposed and repeated, and

spun out to a greater length in artificial forms; than in that short natural plain order, they are laid down in here, wherein everyone may see it; and wherein they must be seen, before they can be put into a train of syllogisms. For the natural order of the connecting ideas must direct the order of the syllogisms, and a man must see the connexion of each intermediate idea with those that it connects, before he can with reason make use of it in a syllogism. And when all those syllogisms are made, neither those that are, nor those that are not logicians will see the force of the argumentation, i.e. the connexion of the extremes one jot the better. (For those that are not men of art, not knowing the true forms of syllogism, nor the reasons of them, cannot know whether they are made in right and conclusive modes and figures or no, and so are not at all helped by the forms they are put into, though by them the natural order, wherein the mind could judge of their respective connexion, being disturbed renders the illation much more uncertain than without them.) And as for the logicians themselves they see the connexion of each intermediate idea with those it stands between (on which the force of the inference depends) as well before as after the syllogism is made, or else they do not see it at all. For a syllogism neither shows nor strengthens the connexion of any two ideas immediately put together, but only by the connexion seen in them shows what connexion the extremes have one with another. But what connexion the intermediate has with either of the extremes in the syllogism, that no syllogism does or can show. That the mind only doth, or can perceive as they stand there in that juxtaposition only by its own view, to which the syllogistical form it happens to be in, gives no help or light at all: it only shows that if the intermediate idea agrees with those 'tis on both sides immediately applied to, then those two remote ones, or as they are called extremes do certainly agree, and therefore the immediate connexion of each idea to that which 'tis applied to on each side, on which the force of the reasoning depends, is as well seen before as after the syllogism is made, or else he that makes the syllogism could never see it at all. This as has been already observed, is seen only by the eye, or the perceptive faculty of the mind, taking a view of them laid together, in a juxtaposition, which view of any two it has equally, whenever they are laid together in any proposition, whether that proposition be placed as a major, or a minor, in a syllogism or no.

Of what use then are syllogisms? I answer, their chief and main use is in the Schools, where men are allowed without shame to deny

the agreement of ideas, that do manifestly agree; or out of the Schools to those, who from thence have learned without shame to deny the connexion of ideas, which even to themselves is visible. But to an ingenuous searcher after truth, who has no other aim, but to find it, there is no need of any such form, to force the allowing of the inference: the truth and reasonableness of 'tis better seen in ranging of the ideas in a simple and plain order; and hence 'tis, that men in their own inquiries after truth never use syllogisms to convince themselves, (or in teaching others to instruct willing learners.) Because, before they can put them into a syllogism they must see the connexion, that is between the intermediate idea, and the two other ideas 'tis set between, and applied to, to show their agreement, and when they see that, they see whether the inference be good or no, and so syllogism comes too late to settle it. For to make use again of the former instance; I ask whether the mind considering the idea of justice, placed as an intermediate idea between the punishment of men, and the guilt of the punished, (and till it does so consider it, the mind cannot make use of it as a *medius terminus*) does not as plainly see the force and strength of the inference, as when 'tis formed into a syllogism. To show it in a very plain and easy example; let animal be the intermediate idea or *medius terminus* that the mind makes use of to show the connexion of *homo* and *vivens*: I ask whether the mind does not more readily and plainly see that connexion, in the simple and proper position of the connecting idea in the middle; thus,

homo—animal—vivens,

than in this perplexed one,

animal—vivens—homo—animal.

Which is the position these ideas have in a syllogism, to show the connexion between *homo* and *vivens* by the intervention of *animal*.

Indeed syllogism is thought to be of necessary use, even to the lovers of truth, to show them the fallacies, that are often concealed in florid, witty or involved discourses. But that this is a mistake will appear, if we consider, that the reason why sometimes men, who sincerely aim at truth, are imposed upon by such loose, and as they are called rhetorical discourses, is that their fancies being struck with some lively metaphorical representations, they neglect to observe, or do not easily perceive what are the true ideas, upon which the

inference depends. Now to show such men the weakness of such an argumentation, there needs no more but to strip if of the superfluous ideas, which, blended and confounded with those on which the inference depends, seem to show a connexion where there is none; or at least to hinder the discovery of the want of it; and then to lay the naked ideas on which the force of the argumentation depends, in their due order, in which position the mind taking a view of them, sees what connexion they have, and so is able to judge of the inference, without any need of a syllogism at all.

I grant that mode and figure is commonly made use of in such cases, as if the detection of the incoherence of such loose discourses, were wholly owing to the syllogistical form; and so I myself formerly thought, till upon a stricter examination, I now find that laying the intermediate ideas naked in their due order, shows the incoherence of the argumentation better, than syllogism; not only as subjecting each link of the chain, to the immediate view of the mind in its proper place, whereby its connexion is best observed; but also because syllogism shows the incoherence only to those (who are not one of ten thousand) who perfectly understand mode and figure, and the reason upon which those forms are established; whereas a due and orderly placing of the ideas, upon which the inference is made, makes everyone both logician or not logician, who understands the terms, and hath the faculty to perceive the agreement, or disagreement of such ideas (without which, in or out of syllogism, he cannot perceive the strength or weakness, coherence or incoherence of the discourse) see the want of connexion in the argumentation, and the absurdity of the inference.

And thus I have known a man unskilful in syllogism, who at first hearing could perceive the weakness and inconclusiveness of a long artificial and plausible discourse, wherewith others better skilled in syllogism have been misled. And I believe there are few of my readers who do not know such. And indeed if it were not so, the debates of most princes' councils, and the business of assemblies, would be in danger to be mismanaged, since those who are relied upon, and have usually a great stroke in them, are not always such, who have the good luck to be perfectly knowing in the forms of syllogism, or expert in mode and figure. And if syllogism were the only, or so much as the surest way to detect the fallacies of artificial discourses; I do not think that all mankind, even princes in matters that concern their crowns

and dignities, are so much in love with falsehood and mistake, that they would everywhere have neglected to bring syllogism into the debates of moment; or thought it ridiculous, so much as to offer them in affairs of consequence; a plain evidence to me, that men of parts and penetration who were not idly to dispute at their ease, but were to act according to the result of their debates, and often pay for their mistakes with their heads or fortunes, found those scholastic forms were of little use to discover truth or fallacy, whilst both the one and the other might be shown, and better shown without them, to those, who would not refuse to see, what was visibly shown them.

Secondly, another reason that makes me doubt whether syllogism be the only proper instrument of reason in the discovery of truth, is, that of whatever use mode and figure is pretended to be in the laying open of fallacy (which has been above considered) those scholastic forms of discourse, are not less liable to fallacies, than the plainer ways of argumentation: and for this I appeal to common observation, which has always found these artificial methods of reasoning more adapted to catch and entangle the mind, than to instruct and inform the understanding. And hence 'tis, that men even when they are baffled and silenced in this scholastic way, are seldom or never convinced, and so brought over to the conquering side; they perhaps acknowledge their adversary to be the more skilful disputant; but rest nevertheless persuaded of the truth on their side; and go away, worsted as they are, with the same opinion they brought with them, which they could not do, if this way of argumentation carried light and conviction with it, and made men see where the truth lay. And therefore syllogism has been thought more proper for the attaining victory in dispute, than for the discovery or confirmation of truth, in fair inquiries. And if it be certain, that fallacies can be couched in syllogism, as it cannot be denied, it must be something else, and not syllogism that must discover them.

I have had experience, how ready some men are, when all the use which they have been wont to ascribe to anything is not allowed, to cry out, that I am for laying it wholly aside. But to prevent such unjust and groundless imputations, I tell them, that I am not for taking away any helps to the understanding, in the attainment of knowledge. And if men skilled in, and used to syllogisms, find them assisting to their reason in the discovery of truth, I think they ought to make use of them. All that I aim at is, that they should not ascribe more to these

forms than belongs to them; and think that men have no use, or not so full a use of their reasoning faculty without them. Some eyes want spectacles to see things clearly and distinctly; but let not those that use them therefore say, nobody can see clearly without them: those who do so, will be thought in favour of art (which perhaps they are beholden to) a little too much to depress and discredit nature. Reason by its own penetration where 'tis strong, and exercised, usually sees quicker, and clearer without syllogism. If use of those spectacles has so dimmed its sight, that it cannot without them see consequences or inconsequences in argumentation, I am not so unreasonable as to be against the using them. Everyone knows what best fits his own sight. But let him not thence conclude all in the dark, who use not just the same helps that he finds a need of.

§5. Helps little in demonstration, less in probability. But however it be in knowledge, I think I may truly say, 'tis of far less, or no use at all in probabilities. For the assent there, being to be determined by the preponderancy, after due weighing of all the proofs, with all circumstances on both sides, nothing is so unfit to assist the mind in that, as syllogism; which running away with one assumed probability, or one topical argument, pursues that till it has led the mind quite out of sight of the thing under consideration; and forcing it upon some remote difficulty, holds it fast there, entangled perhaps, and as it were, manacled in the chain of syllogisms, without allowing it the liberty, much less affording it the helps requisite to show on which side, all things considered, is the greater probability.

§6. Serves not to increase our knowledge, but fence with it. But let it help us (as, perhaps may be said) in convincing men of their errors and mistakes: (and yet I would fain see the man, that was forced out of his opinion by dint of syllogism,) yet still it fails our reason in that part, which if not its highest perfection, is yet certainly its hardest task, and that which we most need its help in; and that is the finding out of proofs, and making new discoveries. The rules of syllogism serve not to furnish the mind with those intermediate ideas, that may show the connexion of remote ones. This way of reasoning discovers no new proofs, but is the art of marshalling, and ranging the old ones we have already. The 47th proposition of the first book of Euclid is very true; but the discovery of it, I think, not owing to any rules of common logic. A man knows first, and then he is able to prove syllogistically. So that syllogism comes after knowledge, and then a

man has little or no need of it. But 'tis chiefly by the finding out those ideas that show the connexion of distant ones, that our stock of knowledge is increased, and that useful arts and sciences are advanced. Syllogism, at best, is but the art of fencing with the little knowledge we have, without making any addition to it. And if a man should employ his reason all this way, he will not do much otherwise, than he, who having got some iron out of the bowels of the Earth, should have it beaten up all into swords, and put it into his servants' hands to fence with, and bang one another. Had the King of Spain employed the hands of his people, and his Spanish iron so, he had brought to light but little of that treasure, that lay so long hid in the dark entrails of America. And I am apt to think, that he who shall employ all the force of his reason only in brandishing of syllogisms, will discover very little of that mass of knowledge, which lies yet concealed in the secret recesses of nature; and which I am apt to think, native rustic reason (as it formerly has done) is likelier to open a way to, and add to the common stock of mankind, rather than any scholastic proceeding by the strict rules of mod and figure.

§7. Other helps should be sought. I doubt not nevertheless, but there are ways to be found to assist our reason in this most useful part; and this the judicious Hooker encourages me to say, who in his Eccl. Pol. l. i. §6 speaks thus: 'If there might be added the right helps of true art and learning (which helps I must plainly confess, this age of the world carrying the name of a learned age, doth neither much know, nor generally regard,) there would undoubtedly be almost as much difference in maturity of judgment between men therewith inured, and that which now are, as between men that are now, and innocents.' I do not pretend to have found, or discovered here any of those 'right helps of art', this great man of deep thought mentions: but that is plain, that syllogism, and the logic now in use, which were as well known in his days, can be none of those he means. 'Tis sufficient for me, if by a Discourse, perhaps something out of the way, I am sure as to me wholly new, and unborrowed, I shall have given occasion to others, to cast about for new discoveries, and to seek in their own thoughts, for those 'right helps of art', which will scarce be found, I fear, by those who servilely confine themselves to the rules and dictates of others. For beaten tracks lead this sort of cattle, (as an observing Roman calls them,) whose thoughts reach only to imitation, *'non quo eundum est, sed quo itur'*. But I can be bold to say, that this age is adorned with some men of that strength of judgment, and

largeness of comprehension, that if they would employ their thoughts on this subject, could open new and undiscovered ways to the advancement of knowledge.

§8. We reason about particulars. Having here had occasion to speak of syllogism in general, and the use of it, in reasoning, and the improvement of our knowledge, 'tis fit, before I leave this subject, to take notice of one manifest mistake in the rules of syllogism; viz. that no syllogistical reasoning can be right and conclusive, but what has, at least, one general proposition in it. As if we could not reason, and have knowledge about particulars. whereas, in truth, the matter rightly considered, the immediate object of all our reasoning and knowledge, is nothing but particulars. Every man's reasoning and knowledge, is only about the ideas existing in his own mind, which are truly, every one of them, particular existences: and our knowledge and reasoning about other things, is only as they correspond with those our particular ideas. So that the perception of the agreement or disagreement of our particular ideas, is the whole and utmost of all our knowledge. Universality is but accidental to it, and consists only in this, that the particular ideas, about which 'tis, are such, as more than one particular thing can correspond with, and be represented by. But the perception of the agreement or disagreement of any two ideas, and consequently, our knowledge is equally clear and certain, whether either, or both, or neither of those ideas be capable of representing more real beings than one, or no. One thing more I crave leave to offer about syllogism, before I leave it, viz. May one not upon just ground inquire whether the form syllogism now has, is that which in reason it ought to have? For the medius terminus being to join the extremes, i.e. the intermediate ideas by its intervention, to show the agreement or disagreement of the two in question, would not the position of the medius terminus be more natural, and show the agreement or disagreement of the extremes clearer and better, if it were placed in the middle between them? Which might be easily done by transposing the propositions, and making the medius terminus the predicate of the first, and the subject of the second. As thus,

Omnis homo est animal,

Omne animal est vivens,

Ergo omnis homo est vivens,

Omne corpus est extensum et solidum,

Nullum extensum et solidum est pura extensio,

Ergo corpus non est pura extensio.

I need not trouble my reader with instances in syllogisms, whose conclusions are particular. The same reason hold for the same form in them, as well as in the general.

§9. First, reason fails us for want of ideas. Reason, though it penetrates into the depths of the sea and Earth, elevates our thoughts as high as the stars, and leads us through the vast spaces, and large rooms of this mighty fabric, yet it comes far short of the real extent of even corporeal being; and there are many instances wherein it fails us: as,

First, It perfectly fails us, where our ideas fail. It neither does, nor can extend itself further than they do. And therefore wherever we have no ideas, our reasoning stops, and we are at an end of our reckoning: and if at any time we reason about words, which do not stand for any ideas, 'tis only about those sounds, and nothing else.

§10. Secondly, because of obscure and imperfect ideas. Secondly, our reason is often puzzled, and at a loss, because of the obscurity, confusion, or imperfection of the ideas 'tis employed about; and there we are involved in difficulties and contradictions. Thus, not having any perfect idea of the least extension of matter, nor of infinity, we are at a loss about the divisibility of matter; but having perfect, clear, and distinct ideas of number, our reason meets with none of those inextricable difficulties in numbers, nor finds itself involved in any contradictions about them. Thus, we having but imperfect ideas of the operations of our minds, and of the beginning of motion or thought how the mind produces either of them in us, and much imperfecter yet, of the operation of GoD, run into great difficulties about free created agents, which reason cannot well extricate itself out of.

§11. Thirdly, for want of intermediate ideas. Thirdly, our reason is often at a stand, because it perceives not those ideas, which could serve to show the certain or probable agreement, or disagreement of any two other ideas: and in this, some men's faculties far outgo

others. Till algebra, that great instrument and instance of human sagacity, was discovered, men, with amazement, looked on several of the demonstrations of ancient mathematicians, and could scarce forbear to think the finding several of those proofs to be something more than human.

§12. Fourthly, because of wrong principles. Fourthly, the mind by proceeding upon false principles is often engaged in absurdities and difficulties, brought into straits and contradictions, without knowing how to free itself: and in that case 'tis in vain to implore the help of reason, unless it be to discover the falsehood and reject the influence of those wrong principles. Reason is so far from clearing the difficulties which the building upon false foundations brings a man into, that if he will pursue it, it entangles him the more, and engages him deeper in perplexities.

§13. Fifthly, because of doubtful terms. as obscure and imperfect ideas often involve our reason, so, upon the same ground, do dubious words, and uncertain signs, often, in discourses and arguings, when not warily attended to, puzzle men's reason, and bring them to a nonplus. But these two latter are our fault, and not the fault of reason. But yet, the consequences of them are nevertheless obvious; and the perplexities, or errors, they fill men's minds with, are everywhere observable.

§14. Our highest degree of knowledge is intuitive, without reasoning. Some of the ideas that are in the mind, are so there, that they can be, by themselves immediately compared, one with another: and in these, the mind is able to perceive, that they agree or disagree, as clearly, as that it has them. Thus the mind perceives, that an arch of a circle is less than the whole circle, as clearly as it does the idea of a circle: and this, therefore, as has been said, I call intuitive knowledge; which is certain, beyond all doubt, and needs no probation, nor can have any; this being the highest of all human certainty. In this consists the evidence of all those maxims, which nobody has any doubt about, but every man (does not, as is said, only assent to, but) knows to be true, as soon as ever they are proposed to his understanding. In the discovery of, and assent to these truths, there is no use of the discursive faculty, no need of reasoning, but they are known by a superior, and higher degree of evidence. And such, if I may guess at things unknown, I am apt to think, that angels have now,

and the spirits of just men made perfect, shall have, in a future state, of thousands of things, which now, either wholly escape our apprehensions, or which, our short-sighted reason having got some faint glimpse of, we, in the dark, grope after.

§15. The next is demonstration by reasoning. But though we have, here and there, a little of this clear light, some sparks of bright knowledge: yet the greatest part of our ideas are such, that we cannot discern their agreement, or disagreement, by an immediate comparing them. And in all these, we have need of reasoning, and must, by discourse and inference, make our discoveries. Now of these, there are two sorts, which I shall take the liberty to mention here again.

First, those whose agreement, or disagreement, though it cannot be seen by an immediate putting them together, yet may be examined by the intervention of other ideas, which can be compared with them. In this case when the agreement, or disagreement of the intermediate idea, on both side, with those which we would compare, is plainly discerned, there it amounts to demonstration, whereby knowledge is produced, which though it be certain, yet 'tis not so easy, nor altogether so clear, as intuitive knowledge. Because in that there is barely one simple intuition, wherein there is no room for any the least mistake or doubt: the truth is seen all perfectly at once. In demonstration, 'tis true, there is intuition too, but not altogether at once; for there must be a remembrance of the intuition of the agreement of the medium, or intermediate idea, with that we compared it with before, when we compare it with the other: and where there be many mediums, there the danger of the mistake is the greater. For each agreement, or disagreement of the ideas must be observed and seen in each step of the whole train, and retained in the memory, just as it is, and the mind must be sure that no part of what is necessary to make up the demonstration is omitted, or overlooked. This makes some demonstration long and perplexed, and too hard for those who have not strength of parts distinctly to perceive, and exactly carry so many particulars orderly in their heads. And even those, who are able to master such intricate speculations, are fain sometimes to go over them again, and there is need of more than one review before they can arrive at certainty. But yet where the mind clearly retains the intuition it had of the agreement of any idea with another, and that with a third, and that with a fourth, etc. there the agreement of the first and the fourth is a demonstration, and produces

certain knowledge, which may be called rational knowledge, as the other is intuitive.

§16. To supply the narrowness of this, we have nothing but judgment upon probable reasoning. Secondly, there are other ideas, whose agreement, or disagreement, can no otherwise be judged of, but by the intervention of others, which have not a certain agreement with the extremes, but an usual or likely one: and in these 'tis, that the judgment is properly exercised, which is the acquiescing of the mind, that any ideas do agree, by comparing them with such probable mediums. This, though it never amounts to knowledge, no not to that which is the lowest degree of it: yet sometimes the intermediate ideas tie the extremes so firmly together, and the probability is so clear and strong, that assent as necessarily follows it, as knowledge does demonstration. The great excellency and use of the judgment, is to observe right, and take a true estimate of the force and weight of each probability; and then casting them up all right together, choose that side, which has the overbalance.

§17. Intuition, demonstration, judgement. Intuitive knowledge, is the perception of the certain agreement, or disagreement of two ideas immediately compared together.

Rational knowledge, is the perception of the certain agreement, or disagreement of any two ideas, by the intervention of one or more other ideas.

Judgment, is the thinking or taking two ideas to agree, or disagree, by the intervention of one or more ideas, whose certain agreement, or disagreement with them it does not perceive, but hath observed to be frequent and usual.

§18. Consequences of words, and consequences of ideas. Though the deducing one proposition from another, or making inferences in words, be a great part of reason, and that which 'tis usually employed about: yet the principal act of ratiocination is the finding the agreement, or disagreement of two ideas one with another, by the intervention of a third. As a man, by a yard, finds two houses to be of the same length, which could not be brought together to measure their equality by juxtaposition. Words have their consequences, as the signs of such ideas: and things agree or disagree, as really they are; but we observe it only by our ideas.

§19. Four sorts of arguments. First, *ad verecundiam*. Before we quit this subject, it may be worth our while a little to reflect on four sorts of arguments, that men in their reasonings with others do ordinarily make use of, to prevail on their assent; or at least to awe them, as to silence their opposition.

First the first is, to allege the opinions of men, whose parts, learning, eminency, power, or some other cause has gained a name, and settled their reputation in the common esteem with some kind of authority. When men are established in any kind of dignity, 'tis thought a breach of modesty for others to derogate any way from it, and question the authority of men, who are in possession of it. This is apt to be censured, as carrying with it too much pride, when a man does not readily yield to the determination of approved authors, which is wont to be received with respect and submission by others: and 'tis looked upon as insolence, for a man to set up, and adhere to his own opinion, against the current stream of antiquity; or to put it in the balance against that of some learned doctor, or otherwise approved writer. Whoever backs his tenets with such authorities, thinks he ought thereby to carry the cause, and is ready to style it impudence in anyone, who shall stand out against them. This, I think, may be called *argumentum ad verecundiam*.

§20. Secondly, *ad ignorantiam*. Secondly, another way that men ordinarily use to drive others, and force them to submit their judgments, and receive the opinion in debate, is to require the adversary to admit what they allege as a proof, or to assign a better. And this I call *argumentum ad ignorantiam*.

§21. Thirdly, *ad hominem*. Thirdly, a third way is, to press a man with consequences drawn from his own principles, or concessions. This is already known under the name of *argumentum ad hominem*.

§22. Fourthly, *ad iudicium*. Fourthly, the fourth is, the using of proofs drawn from any of the foundations of knowledge, or probability. This I call *argumentum ad iudicium*. This alone, of all the four, brings true instruction with it, and advances us in our way to knowledge. For, 1. It argues not another man's opinion to be right, because I out of respect, or any other consideration, but that of conviction, will not contradict him. 2. It proves not another man to be in the right way, nor that I ought to take the same with him, because I know not a better. 3. Nor does it follow, that another man is in the

right way, because he has shown me, that I am in the wrong. I may be modest, and therefore not oppose another man's persuasion: I may be ignorant, and not be able to produce a better: I may be in an error, and another may show me that I am so. This may dispose me, perhaps, for the reception of truth, but helps me not to it; that must come from proofs, and arguments, and light arising from the nature of things themselves, and not from my shamefacedness, ignorance, or error.

§23. Above, contrary, and according to reason. By what has been before said of reason, we may be able to make some guess at the distinction of things, into those that are according to, above, and contrary to reason. 1. According to reason are such propositions, whose truth we can discover, by examining and tracing those ideas we have from sensation and reflection; and by natural deduction, find to be true, or probable. 2. Above reason are such propositions, whose truth or probability we cannot by reason derive from those principles. 3. Contrary to reason are such propositions, as are inconsistent with, or irreconcilable to our clear and distinct ideas. Thus the existence of one God is according to reason; the existence of more than one God, contrary to reason; the resurrection of the dead, above reason. Further, as above reason may be taken in a double sense, viz. either as signifying above probability, or above certainty: and in that large sense also, contrary to reason, is, I suppose sometimes taken.

§24. Reason and faith not opposite. There is another use of the word reason, wherein 'tis opposed to faith; which though it be in itself a very improper way of speaking, yet common use has so authorized it, that it would be folly either to oppose or hope to remedy it: Only I think it may not be amiss to take notice, that however faith be opposed to reason, faith is nothing but a firm assent of the mind: which if it be regulated, as is our duty, cannot be afforded to anything, but upon good reason; and so cannot be opposite to it. He that believes, without having any reason for believing, may be in love with his own fancies; but neither seeks truth as he ought, nor pays the obedience due to his Maker, who would have him use those discerning faculties he has given him, to keep him out of mistake and error. He that does not this to the best of his power, however he sometimes lights on truth, is in the right but by chance; and I know not whether the luckiness of the accident will excuse the irregularity of his

proceeding. This at least is certain, that he must be accountable for whatever mistakes he runs into: whereas he that makes use of the light and faculties God has given him, and seeks sincerely to discover truth, by those helps and abilities he has, may have this satisfaction in doing his duty as a rational creature, that though he should miss truth, he will not miss the reward of it. For he governs his assent right, and places it as he should, who in any case or matter whatsoever, believes or disbelieves, according as reason directs him. He that does otherwise, transgresses against his own light, and misuses those faculties, which were given him to no other end, but to search and follow the clearer evidence, and greater probability. But since reason and faith are by some men opposed, we will so consider them in the following chapter.

Chapter XVIII Of Faith and Reason, and their Distinct Provinces

§1. Necessary to know their boundaries. It has been above shown, 1. That we are of necessity ignorant, and want knowledge of all sorts, where we want ideas. 2. That we are ignorant, and want rational knowledge, where we want proofs. 3. That we want general knowledge and certainty, as far as we want clear and determined specific ideas. 4. That we want probability to direct our assent in matters where we have neither knowledge of our own, nor testimony of other men to bottom our reason upon.

From these things thus premised, I think we may come to lay down the measures and boundaries between faith and reason: the want whereof may possibly have been the cause, if not of great disorders, yet at least of great disputes, and perhaps mistakes in the world. For till it be resolved, how far we are to be guided by reason, and how far by faith, we shall in vain dispute, and endeavour to convince one another in matters of religion.

§2. Faith and reason what, as contradistinguished. I find every sect, as far as reason will help them, make use of it gladly: and where it fails them, they cry out, ‘ ’Tis matter of faith, and above reason.’ And I do not see how they can argue with anyone, or ever convince a gainsayer’ who makes use of the same plea, without setting down strict boundaries between faith and reason; which ought to be the first point established in all questions where faith has anything to do.

Reason, therefore, here, as contradistinguished to faith, I take to be the discovery of the certainty or probability of such propositions or truths which the mind arrives at by deduction made from such ideas, which it has got by the use of its natural faculties, viz. by sensation or reflection.

Faith, on the other side, is the assent to any proposition, not thus made out by the deductions of reason, but upon the credit of the proposer, as coming from God, in some extraordinary way of communication. This way of discovering truths to men we call revelation.

§3. No new simple idea can be conveyed by traditional revelation. First, then, I say, that no man inspired by God, can by any revelation communicate to others any new simple ideas which they had not before from sensation or reflection. For whatsoever impressions he himself may have from the immediate hand of God, this revelation, if it be of new simple ideas, cannot be conveyed to another, either by words or any other signs. Because words, by their immediate operation on us, cause no other ideas but of their natural sounds: and 'tis by the custom of using them for signs, that they excite and revive in our minds latent ideas; but yet only such ideas, as were there before. For words, seen or heard, recall to our thoughts those ideas only, which to us they have been wont to be signs of: but cannot introduce any perfectly new, and formerly unknown simple ideas. The same holds in all other signs, which cannot signify to us things, of which we have before never had any idea at all.

Thus whatever things were discovered to St. Paul, when he was rapt up into the third heaven; whatever new ideas his mind there received, all the description he can make to others of that place, is only this, that there are such things, 'as eye hath not seen, nor ear heard, nor hath it entered into the heart of man to conceive.' And, supposing God should discover to anyone, supernaturally, a species of creatures inhabiting, for example, Jupiter, or Saturn, (for that 'tis possible there may be such, nobody can deny) which had six senses; and imprint on his mind the ideas conveyed to theirs by that sixth sense: he could no more, by words, produce in the minds of other men those ideas, imprinted in that sixth sense, than one of us could convey the idea of any colour, by the sounds of words into a man, who having the other four senses perfect, had always totally wanted the fifth of seeing. For

our simple ideas, then, which are the foundation, and sole matter of all our notions, and knowledge, we must depend wholly on our reason, I mean, our natural faculties: and can by no means receive them, or any of them, from traditional revelation, I say, traditional revelation, in distinction to original revelation. By the one, I mean that first impression which is made immediately by God, on the mind of any man, to which we cannot set any bounds; and by the other, those impressions delivered over to others in words, and the ordinary ways of conveying our conceptions one to another.

§4. Traditional revelation may make us know propositions knowable also by reason, but not with the same certainty that reason doth. Secondly, I say, that the same truths may be discovered, and conveyed down from revelation, which are discoverable to us by reason, and by those ideas we naturally may have. So God might, by revelation, discover the truth of any proposition in Euclid; as well as men, by the natural use of their faculties, come to make the discovery themselves. In all things of this kind, there is little need or use of revelation, God having furnished us with natural and surer means to arrive at the knowledge of them. For whatsoever truth we come to the clear discovery of, from the knowledge and contemplation of our own ideas, will always be certainer to us, than those which are conveyed to us by traditional revelation. For the knowledge, we have, that this revelation came at first from God can never be so sure, as the knowledge we have from the clear and distinct perception of the agreement, or disagreement of our own ideas, v.g. if it were revealed some ages since, that the three angles of a triangle were equal to two right ones, I might assent to the truth of that proposition, upon the credit of that tradition, that it was revealed: but that would never amount to so great a certainty, as the knowledge of it, upon the comparing and measuring my own ideas of two right-angles, and the three angles of a triangle. The like holds in matter of fact, knowable by our senses, v.g. the history of the deluge is conveyed to us by writings, which had their original from revelation: and yet nobody, I think, will say, he has as certain and clear a knowledge of the flood, as Noah that saw it; or that he himself would have had, had he then been alive, and seen it. For he has no greater an assurance than that of his senses, that 'tis writ in the book supposed writ by Moses inspired: but he has not so great an assurance that Moses writ that book, as if he had seen Moses write it. So that the assurance of its being a revelation, is less still than the assurance of his senses.

§5. Revelation cannot be admitted against the clear evidence of reason. In propositions then, whose certainty is built upon the clear perception of the agreement or disagreement of our ideas attained either by immediate intuition, as in self-evident propositions, or by evident deductions of reason, in demonstrations, we need not the assistance of revelation, as necessary to gain our assent, and introduce them into our minds. Because the natural ways of knowledge could settle them there, or had done it already, which is the greatest assurance we can possibly have of anything, unless where God immediately reveals it to us: and there too our assurance can be no greater, than our knowledge is, that 'tis a revelation from God. But yet nothing, I think can, under that title, shake or overrule plain knowledge; or rationally prevail with any man, to admit it for true, in a direct contradiction to the clear evidence of his own understanding. For since no evidence of our faculties, by which we receive such revelations, can exceed, if equal, the certainty of our intuitive knowledge, we can never receive for a truth anything, that is directly contrary to our clear and distinct knowledge, v.g. the ideas of one body, and one place, do so clearly agree; and the mind has so evident a perception of their agreement, that we can never assent to a proposition, that affirms the same body to be in two distant places at once, however it should pretend to the authority of a divine revelation: since the evidence, first, that we deceive not ourselves in ascribing it to God; secondly, that we understand it right, can never be so great, as the evidence of our own intuitive knowledge, whereby we discern it impossible, for the same body to be in two places at once. And therefore, no proposition can be received for divine revelation, or obtain the assent due to all such, if it be contradictory to our clear intuitive knowledge. Because this would be to subvert the principles, and foundations of all knowledge, evidence, and assent whatsoever: and there would be left no difference between truth and falsehood, no measures of credible and incredible in the world, if doubtful propositions shall take place before self-evident; and what we certainly know give way to what we may possibly be mistaken in. In propositions therefore contrary to the clear perception of the agreement or disagreement of any of our ideas, 'twill be in vain to urge them as matters of faith. They cannot move our assent under that, or any other title whatsoever. For faith can never convince us of anything, that contradicts our knowledge. Because, though faith be founded on the testimony of God (who cannot lie) revealing any proposition to us: yet we cannot have an assurance of the truth of its

being a divine revelation, greater than our own knowledge. Since the whole strength of the certainty depends upon our knowledge, that God revealed it, which, in this case, where the proposition supposed revealed contradicts our knowledge or reason, will always have this objection hanging to it, viz. that we cannot tell how to conceive that to come from God, the bountiful author of our being, which if received for true, must overturn all the principles and foundations of knowledge he has given us; render all our faculties useless; wholly destroy the most excellent part of his workmanship, our understandings; and put a man in a condition, wherein he will have less light, less conduct than the beast that perisheth. For if the mind of man can never have a clearer, (and, perhaps, not so clear) evidence of anything to be a divine revelation, as it has of the principles of its own reason, it can never have a ground to quit the clear evidence of its reason, to give a place to a proposition, whose revelation has not a greater evidence, than those principles have.

§6. Traditional revelation much less. Thus far a man has use of reason, and ought to hearken to it, even in immediate and original revelation, where 'tis supposed to be made to himself: but to all those who pretend not to immediate revelation, but are required to pay obedience, and to receive the truths revealed to others, which, by the tradition of writings, or word of mouth, are conveyed down to them, reason has a great deal more to do, and is that only which can induce us to receive them. For matter of faith being only divine revelation, and nothing else, faith, as we use the word, (called commonly divine faith) has to do with no propositions, but those which are supposed to be divinely revealed. So that I do not see how those who make revelation alone the sole object of faith, can say, that 'tis a matter of faith, and not of reason, to believe, that such or such a proposition, to be found in such or such a book, is of divine inspiration; unless it be revealed, that that proposition, or all in that book, was communicated by divine inspiration. Without such a revelation, the believing, or not believing that proposition, or book, to be of divine authority, can never be matter of faith, but matter of reason; and such, as I must come to an assent to only by the use of my reason, which can never require or enable me to believe that, which is contrary to itself: it being impossible for reason ever to procure any assent to that, which to itself appears unreasonable.

In all things therefore, where we have clear evidence from our

ideas, and those principles of knowledge, I have abovementioned, reason is the proper judge; and revelation, though it may in consenting with it, confirm its dictates, yet cannot in such cases, invalidate its decrees: nor can we be obliged, where we have the clear and evident sentence of reason, to quit it, for the contrary opinion, under a pretence that 'tis matter of faith; which can have no authority against the plain and clear dictates of reason.

§7. Things above reason. But thirdly, there being many things wherein we have very imperfect notions, or none at all; and other things, of whose past, present, or future existence, by the natural use of our faculties, we can have no knowledge at all; these, as being beyond the discovery of our natural faculties, and above reason, are, when revealed, the proper matter of faith. Thus, that part of the angels rebelled against God, and thereby lost their first happy state: and that the dead shall rise, and live again: these, and the like, being beyond the discovery of reason, are purely matters of faith; with which reason has, directly, nothing to do.

§8. Or not contrary to reason, if revealed, are matter of faith. But since God in giving us the light of reason has not thereby tied up his own hands from affording us, when he thinks fit, the light of revelation in any of those matters, wherein our natural faculties are able to give a probable determination; revelation, where God has been pleased to give it, must carry it, against the probable conjectures of reason. Because the mind, not being certain of the truth of that it does not evidently know, but only yielding to the probability that appears in it, is bound to give up its assent to such a testimony, which, 'tis satisfied, comes from one, who cannot err, and will not deceive. But yet, it still belongs to reason, to judge of the truth of its being a revelation, and of the signification of the words, wherein 'tis delivered. Indeed, if anything shall be thought revelation, which is contrary to the plain principles of reason, and the evident knowledge the mind has of its own clear and distinct ideas; there reason must be hearkened to, as to a matter within its province. Since a man can never have so certain a knowledge, that a proposition which contradicts the clear principles and evidence of his own knowledge, was divinely revealed, or that he understands the words rightly wherein 'tis delivered, as he has, that the contrary is true, and so is bound to consider and judge of it as a matter of reason, and not swallow it, without examination, as a matter of faith.

§9. Revelation in matters where reason cannot judge, or but probably, ought to be hearkened to. First, whatever proposition is revealed, of whose truth our mind, by its natural faculties and notions, cannot judge, that is purely matter of faith, and above reason.

Secondly, all propositions, whereof the mind, by the use of its natural faculties, can come to determine and judge, from naturally acquired ideas, are matter of reason; with this difference still, that in those, concerning which it has but an uncertain evidence, and so is persuaded of their truth, only upon probable grounds, which still admit a possibility of the contrary to be true, without doing violence to the certain evidence of its own knowledge, and overturning the principles of all reason, in such probable propositions, I say, an evident revelation ought to determine our assent even against probability. For where the principles of reason have not evidenced a proposition to be certainly true or false, there clear revelation, as another principle of truth, and ground of assent, may determine; and so it may be matter of faith, and be also above reason. Because reason, in that particular matter, being able to reach no higher than probability, faith gave the determination where reason came short; and revelation discovered on which side the truth lay.

§10. In matters where reason can afford certain knowledge, that is to be hearkened to. Thus far the dominion of faith reaches, and that without any violence, or hindrance to reason; which is not injured, or disturbed, but assisted and improved, by new discoveries of truth, coming from the eternal fountain of all knowledge. Whatever God hath revealed, is certainly true; no doubt can be made of it. This is the proper object of faith: but whether it be a divine revelation, or no, reason must judge; which can never permit the mind to reject a greater evidence to embrace what is less evident, nor allow it to entertain probability in opposition to knowledge and certainty. There can be no evidence, that any traditional revelation is of divine original, in the words we receive it, and in the sense we understand it, so clear, and so certain, as that of the principles of reason: and therefore, nothing that is contrary to, and inconsistent with the clear and self-evident dictates of reason, has a right to be urged, or assented to, as a matter of faith, wherein reason hath nothing to do. Whatsoever is divine revelation, ought to overrule all our opinions, prejudices, and interests, and hath a right to be received with full assent: such a submission as this of our reason to faith, takes not away

the landmarks of knowledge: this shakes not the foundations of reason, but leaves us that use of our faculties, for which they were given us.

§11. If the boundaries be not set between faith and reason, no enthusiasm, or extravagancy in religion can be contradicted. If the provinces of faith and reason are not kept distinct by these boundaries, there will, in matters of religion, be no room for reason at all; and those extravagant opinions and ceremonies, that are to be found in the several religions of the world, will not deserve to be blamed. For, to this crying up of faith, in opposition to reason, we may, I think, in good measure, ascribe those absurdities, that fill almost all the religions which possess and divide mankind. For men having been principled with an opinion, that they must not consult reason in the things of religion, however apparently contradictory to common sense, and the very principles of all their knowledge, have let loose their fancies, and natural superstition; and have been, by them, led into so strange opinions, and extravagant practices in religion, that a considerate man cannot but stand amazed at their follies, and judge them so far from being acceptable to the great and wise God, that he cannot avoid thinking them ridiculous, and offensive to a sober, good man. So that, in effect religion, which should most distinguish us from beasts, and ought most peculiarly to elevate us, as rational creatures, above brutes, is that wherein men often appear most irrational, and more senseless than beasts themselves. *Credo, quia impossibile est*: I believe, because 'tis impossible, might, in a good man, pass for a sally of zeal; but would prove a very ill rule for men to choose their opinions, or religion by.

Chapter XIX Of Enthusiasm

§1. Love of truth necessary. He that would seriously set upon the search of truth, ought in the first place to prepare his mind with a love of it. For he that loves it not, will not take much pains to get it; nor be much concerned when he misses it. There is nobody in the commonwealth of learning, who does not profess himself a lover of truth: and there is not a rational creature that would not take it amiss to be thought otherwise of. And yet for all this one may truly say, there are very few lovers of truth for truth's sake, even amongst those, who persuade themselves that they are so. How a man may know whether he be so in earnest is worth inquiry: and I think there is one

unerring mark of it, viz. the not entertaining any proposition with greater assurance than the proofs 'tis built upon will warrant. Whoever goes beyond this measure of assent, 'tis plain receives not the truth in the love of it; loves not truth for truth's sake, but for some other by-end. For the evidence that any proposition is true (except such as are self-evident) lying only in the proofs a man has of it, whatsoever degrees of assent he affords it beyond the degrees of that evidence, 'tis plain all that surplusage of assurance is owing to some other affection, and not to the love of truth: it being as impossible, that the love of truth should carry my assent above the evidence, that there is to me, that 'tis true, as that the love of truth should make me assent to any proposition, for the sake of that evidence, which it has not, that 'tis true: which is in effect to love it as a truth, because 'tis possible or probable that it may not be true. In any truth that gets not possession of our minds by the irresistible light of self-evidence, or by the force of demonstration, the arguments that gain it assent, are the vouchers and gauge of its probability to us; and we can receive it for no other than such as they deliver it to our understandings. Whatsoever credit or authority we give to any proposition more than it receives from the principles and proofs it supports itself upon, is owing to our inclinations that way, and is so far a derogation from the love of truth as such: which as it can receive no evidence from our passions or interests, so it should receive no tincture from them.

§2. A forwardness to dictate from whence. The assuming an authority of dictating to others, and a forwardness to prescribe to their opinions, is a constant concomitant of this bias and corruption of our judgments. For how almost can it be otherwise, but that he should be ready to impose on others belief, who has already imposed on his own? Who can reasonably expect arguments and conviction from him, in dealing with others, whose understanding is not accustomed to them in his dealing with himself? Who does violence to his own faculties, tyrannizes over his own mind, and usurps the prerogative that belongs to truth alone, which is to command assent by only its own authority, i.e. by and in proportion to that evidence which it carries with it.

§3. Force of enthusiasm. Upon this occasion I shall take the liberty to consider a third ground of assent, which with some men has the same authority, and is as confidently relied on as either faith or reason, I mean enthusiasm. Which laying by reason would set up

revelation without it. Whereby in effect it takes away both reason and revelation, and substitutes in the room of it, the ungrounded fancies of a man's own brain, and assumes them for a foundation both of opinion and conduct.

§4. Reason and revelation. Reason is natural revelation, whereby the eternal Father of light, and fountain of all knowledge communicates to mankind that portion of truth, which he has laid within the reach of their natural faculties: revelation is natural reason enlarged by a new set of discoveries communicated by God immediately, which reason vouches the truth of, by the testimony and proofs it gives, that they come from God. So that he that takes away reason, to make way for revelation, puts out the light of both, and does much what the same, as if he would persuade a man to put out his eyes the better to receive the remote light of an invisible star by a telescope.

§5. Rise of enthusiasm. Immediate revelation being a much easier way for men to establish their opinions, and regulate their conduct, than the tedious and not always successful labour of strict reasoning, 'tis no wonder, that some have been very apt to pretend to revelation, and to persuade themselves, that they are under the peculiar guidance of heaven in their actions and opinions, especially in those of them, which they cannot account for by the ordinary methods of knowledge, and principles of reason. Hence we see, that in all ages, men, in whom melancholy has mixed with devotion, or whose conceit of themselves has raised them into an opinion of a greater familiarity with God, and a nearer admittance to his favour than is afforded to others, have often flattered themselves with a persuasion of an immediate intercourse with the Deity, and frequent communications from the divine spirit. God I own cannot be denied to be able to enlighten the understanding by a ray darted into the mind immediately from the fountain of light: this they understand he has promised to do, and who then has so good a title to expect it, as those who are his peculiar people, chosen by him, and depending on him'

§6. Enthusiastic. Their minds being thus prepared, whatever groundless opinion comes to settle itself strongly upon their fancies is an illumination from the spirit of God, and presently of divine authority: and whatsoever odd action they find in themselves a strong inclination to do, that impulse is concluded to be a call or direction

from heaven, and must be obeyed; 'tis a commission from above, and they cannot err in executing it.

§7. This I take to be properly enthusiasm, which though founded neither on reason, nor divine revelation, but rising from the conceits of a warmed or over-weening brain, works yet, where it once gets footing, more powerfully on the persuasions and actions of men, than either of those two, or both together: men being most forwardly obedient to the impulses they receive from themselves; and the whole man is sure to act more vigorously, where the whole man is carried by a natural motion. For strong conceit like a new principle carries all easily with it, when got above common sense, and freed from all restraint of reason, and check of reflection, 'tis heightened into a divine authority, in concurrence with our own temper and inclination.

§8. Enthusiasm mistaken for seeing and feeling. Though the odd opinions and extravagant actions, enthusiasm has run men into, were enough to warn them against this wrong principle so apt to misguide them both in their belief and conduct: yet the love of something extraordinary, the ease and glory 'tis to be inspired and be above the common and natural ways of knowledge so flatters many men's laziness, ignorance, and vanity, that when once they are got into this way of immediate revelation; of illumination without search; and of certainty without proof, and without examination, 'tis a hard matter to get them out of it. Reason is lost upon them, they are above it: they see the light infused into their understandings, and cannot be mistaken; 'tis clear and visible there; like the light of bright Sunshine, shows itself, and needs no other proof, but its own evidence: they feel the hand of God moving them within, and the impulses of the spirit, and cannot be mistaken in what they feel. Thus they support themselves, and are sure reason hath nothing to do with what they see and feel in themselves: what they have a sensible experience of admits no doubt, needs no probation. Would he not be ridiculous who should require to have it proved to him, that the light shines, and that he sees it? 'Tis its own proof, and can have no other. When the spirit brings light into our minds, it dispels darkness. We see it, as we do that of the sun at noon, and need not the twilight of reason to show it us. This light from heaven is strong, clear, and pure, carries its own demonstration with it, and we may as naturally take a glow-worm to assist us to discover the Sun, as to examine the celestial ray by our dim candle, reason.

§9. This is the way of talking of these men: they are sure, because they are sure: and their persuasions are right, only because they are strong in them. For, when what they say is stripped of the metaphor of seeing and feeling, this is all it amounts to: and yet these similes so impose on them, that they serve them for certainty in themselves, and demonstration to others.

§10. Enthusiasm how to be discovered. But to examine a little soberly this internal light, and this feeling on which they build so much. These men have, they say, clear light, and they see; they have an awakened sense, and they feel: this cannot, they are sure, be disputed them. For when a man says he sees or feels, nobody can deny it him that he does so. But here let me ask: this seeing is it the perception of the truth of the proposition, or of this, that 'tis a revelation from God? This feeling is it a perception of an inclination or fancy to do something, or of the spirit of God moving that inclination? These are two very different perceptions, and must be carefully distinguished, if we would not impose upon ourselves. I may perceive the truth of a proposition, and yet not perceive, that 'tis an immediate revelation from God. I may perceive the truth of a proposition in Euclid, without its being, or my perceiving it to be a revelation: Nay I may perceive I came not by this knowledge in a natural way, and so may conclude it revealed, without perceiving that 'tis a revelation from God. Because there be spirits, which, without being divinely commissioned, may excite those ideas in me, and lay them in such order before my mind, that I may perceive their connexion. So that the knowledge of any proposition coming into my mind, I know not how, is not a perception that 'tis from God. Much less is a strong persuasion, that 'tis true, a perception that 'tis from God, or so much as true. But however it be called light and seeing; I suppose, 'tis at most but belief, and assurance: and the proposition taken for a revelation is not such, as they know, to be true, but take to be true. For where a proposition is known to be true, revelation is needless: and 'tis hard to conceive how there can be a revelation to anyone of what he knows already. If therefore it be a proposition which they are persuaded, but do not know, to be true, whatever they may call it, 'tis not seeing, but believing. For these are two ways, whereby truth comes into the mind, wholly distinct, so that one is not the other. What I see I know to be so by the evidence of the thing itself: what I believe, I take to be so upon the testimony of another: but this testimony I must know to be given, or else what ground have I of

believing‘ I must see that ’tis God that reveals this to me, or else I see nothing. The question then here is, How do I know that God is the revealer of this to me; that this impression is made upon my mind by his Holy Spirit, and that therefore I ought to obey it‘ If I know not this, how great soever the assurance is, that I am possessed with, ’tis groundless; whatever light I pretend to, ’tis but enthusiasm. For, whether the proposition supposed to be revealed, be in itself evidently true, or visibly probable, or by the natural ways of knowledge uncertain, the proposition that must be wellgrounded, and manifested to be true is this, that God is the revealer of it, and that what I take to be a revelation is certainly put into my mind by him, and is not an illusion dropped in by some other spirit, or raised by my own fancy. For if I mistake not, these men receive it for true, because they presume God revealed it. Does it not then stand them upon, to examine upon what grounds they presume it to be a revelation from God‘ or else all their confidence is mere presumption: and this light, they are so dazzled with, is nothing, but an ignis fatuus that leads them constantly round in this circle. ’Tis a revelation, because they firmly believe it, and they believe it, because ’tis a revelation.

§11. Enthusiasm fails of evidence, that the proposition is from God. In all that is of divine revelation, there is need of no other proof but that ’tis an inspiration from God: for he can neither deceive, nor be deceived. But how shall it be known, that any proposition in our minds is a truth infused by God; a truth that is revealed to us by him, which he declares to us, and therefore we ought to believe‘ Here ’tis that enthusiasm fails of the evidence it pretends to. For men thus possessed boast of a light whereby they say, they are enlightened, and brought into the knowledge of this or that truth. But if they know it to be a truth, they must know it to be so either by its own self-evidence to natural reason; or by the rational proofs that make it out to be so. If they see and know it to be a truth, either of these two ways, they in vain suppose it to be a revelation. For they know it to be true the same way, that any other man naturally may know, that ’tis so without the help of revelation. For thus all the truths of what kind soever that men uninspired are enlightened with, came into their minds, and are established there. If they say they know it to be true, be cause ’tis a revelation from God, the reason is good: but then it will be demanded, how they know it to be a revelation from God. If they say by the light it brings with it, which shines bright in their minds, and they cannot resist. I beseech them to consider, whether this be

any more, than what we have taken notice of already, viz. that 'tis a revelation because they strongly believe it to be true. For all the light they speak of is but a strong, though ungrounded persuasion of their own minds that 'tis a truth. For rational grounds from proofs that 'tis a truth they must acknowledge to have none, for then 'tis not received as a revelation, but upon the ordinary grounds, that other truths are received: and if they believe it to be true, because 'tis a revelation, and have no other reason for its being a revelation, but because they are fully persuaded without any other reason that 'tis true, then they believe it to be a revelation only because they strongly believe it to be a revelation, which is a very unsafe ground to proceed on, either in our tenets, or actions: and what readier way can there be to run ourselves into the most extravagant errors and miscarriages than thus to set up fancy for our supreme and sole guide, and to believe any proposition to be true, any action to be right, only because we believe it to be so? The strength of our persuasions are no evidence at all of their own rectitude: crooked things may be as stiff and inflexible as straight: and men may be as positive and peremptory in error as in truth. How come else the untractable zealots in different and opposite parties? For if the light, which everyone thinks he has in his mind, which in this case is nothing but the strength of his own persuasion, be an evidence that 'tis from God, contrary opinions may have the same title to be inspirations; and God will be not only the father of lights, but of opposite and contradictory lights, leading men contrary ways; and contradictory propositions will be divine truths, if an ungrounded strength of assurance be an evidence, that any proposition is a divine revelation.

§12. Firmness of persuasion no Proof that any proposition is from God. This cannot be otherwise, whilst firmness of persuasion is made the cause of believing, and confidence of being in the right, is made an argument of truth; St Paul himself believed he did well, and that he had a call to it, when he persecuted the Christians, whom he confidently thought in the wrong: but yet it was he, and not they, who were mistaken. Good men are men still, liable to mistakes, and are sometimes warmly engaged in errors, which they take for divine truths, shining in their minds with the clearest light.

§13. Light in the mind, what. Light, true light in the mind is, or can be nothing else but the evidence of the truth of any proposition; and if it be not a self-evident proposition, all the light it

has, or can have, is from the clearness and validity of those proofs, upon which 'tis received. To talk of any other light in the understanding is to put ourselves in the dark, or in the power of the prince of darkness, and, by our own consent, to give ourselves up to delusion to believe a lie. For if strength of persuasion be the light, which must guide us; I ask how shall anyone distinguish between the delusions of Satan, and the inspirations of the Holy Ghost? He can transform himself into an angel of light. And they who are led by this son of the morning are as fully satisfied of the illumination, i.e. are as strongly persuaded, that they are enlightened by the spirit of God, as anyone who is so: they acquiesce and rejoice in it, are acted by it: and nobody can be more sure, nor more in the right (if their own strong belief may be judge) than they.

§14. Revelation must be judged of by reason. He therefore that will not give himself up to all the extravagances of delusion and error must bring this guide of his light within to the trial. God when he makes the prophet does not unmake the man. He leaves all his faculties in the natural state, to enable him to judge of his inspirations, whether they be of divine original or no. When he illuminates the mind with supernatural light, he does not extinguish that which is natural. If he would have us assent to the truth of any proposition, he either evidences that truth by the usual methods of natural reason, or else makes it known to be a truth which he would have us assent to, by his authority, and convinces us that 'tis from him, by some marks which reason cannot be mistaken in. Reason must be our last judge and guide in everything. I do not mean, that we must consult reason, and examine whether a proposition revealed from God can be made out by natural principles, and if it cannot, that then we may reject it: but consult it we must, and by it examine, whether it be a revelation from God or no: and if reason finds it to be revealed from God, reason then declares for it, as much as for any other truth, and makes it one of her dictates. Every conceit that thoroughly warms our fancies must pass for an inspiration, if there be nothing but the strength of our persuasions, whereby to judge of our persuasions: if reason must not examine their truth by something extrinsical to the persuasions themselves; inspirations and delusions, truth and falsehood will have the same measure, and will not be possible to be distinguished.

§15. Belief no proof of revelation. If this internal light, or any

proposition which under that title we take for inspired, be conformable to the principles of reason or to the word of God, which is attested revelation, reason warrants it, and we may safely receive it for true, and be guided by it in our belief and actions: if it receive no testimony nor evidence from either of these rules, we cannot take it for a revelation, or so much as for true, till we have some other mark that 'tis a revelation, besides our believing that 'tis so. Thus we see the holy men of old, who had revelations from God, had something else besides that internal light of assurance in their own minds, to testify to them, that it was from God. They were not left to their own persuasions alone, that those persuasions were from God; but had outward signs to convince them of the author of those revelations. And when they were to convince others, they had a power given them to justify the truth of their commission from heaven; and by visible signs to assert the divine authority of a message they were sent with. Moses saw the bush burn without being consumed, and heard a voice out of it. This was something besides finding an impulse upon his mind to go to Pharaoh, that he might bring his brethren out of Egypt: and yet he thought not this enough to authorize him to go with that message, till God by another miracle, of his rod turned into a serpent, had assured him of a power to testify his mission by the same miracle repeated before them, whom he was sent to. Gideon was sent by an angel to deliver Israel from the Midianites, and yet he desired a sign to convince him, that this commission was from God. These and several the like instances to be found among the prophets of old, are enough to show, that they thought not an inward seeing or persuasion of their own minds without any other proof a sufficient evidence, that it was from God, though the Scripture does not everywhere mention their demanding or having such proofs.

§16. In what I have said I am far from denying, that God can, or doth sometimes enlighten men's minds in the apprehending of certain truths, or excite them to good actions by the immediate influence and assistance of the Holy Spirit, without any extraordinary signs accompanying it. But in such cases too we have reason and the Scripture, unerring rules to know whether it be from God or no. Where the truth embraced is consonant to the revelation in the written word of God; or the action conformable to the dictates of right reason or holy writ, we may be assured that we run no risk in entertaining it as such, because though perhaps it be not an immediate revelation from God, extraordinarily operating on our minds, yet we

are sure 'tis warranted by that revelation which he has given us of truth. But 'tis not the strength of our private persuasion within ourselves, that can warrant it to be a light or motion from heaven: nothing can do that but the written word of God without us, or that standard of reason which is common to us with all men. Where reason or Scripture is express for any opinion or action, we may receive it as of divine authority: but 'tis not the strength of our own persuasions which can by self give it that stamp. The bent of our own minds may favour it as much as we please; that may show it to be a fondling of our own, but will by no means prove it to be an offspring of heaven, and of divine original.

Chapter XX Of Wrong Assent, or Error

§1. Causes of error. Knowledge being to be had only of visible and certain truth, error is not a fault of our knowledge, but a mistake of our judgment giving assent to that, which is not true.

But if assent be grounded on likelihood, if the proper object and motive of our assent be probability, and that probability consists in what is laid down in the foregoing chapters, it will be demanded how men come to give their assents contrary to probability. For there is nothing more common, than contrariety of opinions; nothing more obvious, than that one man wholly disbelieves what another only doubts of, and a third stedfastly believes, and firmly adheres to. The reasons whereof, though they may be very various, yet, I suppose, may all be reduced to these four.

1. Want of proofs.
2. Want of ability to use them.
3. Want of will to see them.
4. Wrong measures of probability.

§2. First, want of proofs. First, by want of proofs: I do not mean, only the want of those proofs which are nowhere extant, and so are nowhere to be had; but the want even of those proofs which are in being, or might be procured. And thus men want proofs, who have not the convenience, or opportunity to make experiments and observations themselves, tending to the proof of any proposition; nor

likewise the convenience to inquire into, and collect the testimonies of others: and in this state are the greatest part of mankind, who are given up to labour, and enslaved to the necessity of their mean condition; whose lives are worn out, only in the provisions for living. These men's opportunities of knowledge and inquiry, are commonly as narrow as their fortunes; and their understandings are but little instructed, when all their whole time and pains is laid out, to still the croaking of their own bellies, or the cries of their children.'Tis not to be expected, that a man, who drudges on, all his life, in a laborious trade, should be more knowing in the variety of things done in the world, than a pack-horse, who is driven constantly forwards and backwards, in a narrow lane, and dirty road, only to market, should be skilled in the geography of the country. Nor is it at all more possible, that he who wants leisure, books, and languages, and the opportunity of conversing with variety of men, should be in a condition to collect those testimonies and observations, which are in being, and are necessary to make out many, nay most, of the propositions, that, in the societies of men, are judged of the greatest moment; or to find out grounds of assurance so great, as the belief of the points he would build on them, is thought necessary. So that a great part of mankind are, by the natural and unalterable state of things in this world, and the constitution of human affairs, unavoidably given over to invincible ignorance of those proofs, on which others build, and which are necessary to establish those opinions: the greatest part of men, having much to do to get the means of living, are not in a condition to look after those of learned and laborious inquiries.

§3. Objection. What shall become of these who want them, answered. What shall we say then? Are the greatest part of mankind, by the necessity of their condition, subjected to unavoidable ignorance in those things, which are of greatest importance to them? (for of those, 'tis obvious to inquire.) Have the bulk of mankind no other guide, but accident, and blind chance, to conduct them to their happiness, or misery? Are the current opinions, and licensed guides of every country sufficient evidence and security to every man, to venture his greatest concerns on; nay, his everlasting happiness, or misery? Or can those be the certain and infallible oracles and standards of truth, which teach one thing in Christendom, and another in Turkey? Or shall a poor countryman be eternally happy, for having the chance to be born in Italy; or a day-labourer be unavoidably lost,

because he had the ill luck to be born in England' How ready some men may be to say some of these things, I will not here examine: but this I am sure, that men must allow one or other of these to be true, (let them choose which they please;) or else grant, that God has furnished men with faculties sufficient to direct them in the way they should take, if they will but seriously employ them that way, when their ordinary vocations allow them the leisure. No man is so wholly taken up with the attendance on the means of living, as to have no spare time at all to think of his soul, and inform himself in matters of religion. Were men as intent upon this, as they are on things of lower concernment, there are none so enslaved to the necessities of life, who might not find many vacancies, that might be husbanded to this advantage of their knowledge.

§4. People hindered from inquiry. Besides those, whose improvements and informations are straitened by the narrowness of their fortunes, there are others, whose largeness of fortune would plentifully enough supply books, and other requisites for clearing of doubts, and discovering of truth: but they are cooped in close, by the laws of their countries, and the strict guards of those, whose interest 'tis to keep them ignorant, lest, knowing more, they should believe the less in them. These are as far, nay further from the liberty and opportunities of a fair inquiry, than those poor and wretched labourers, we before spoke of. And, however they may seem high and great, are confined to narrowness of thought, and enslaved in that which should be the freest part of man, their understandings. This is generally the case of all those, who live in places where care is taken to propagate truth, without knowledge; where men are forced, at a venture, to be of the religion of the country; and must therefore swallow down opinions, as silly people do empirics' pills, without knowing what they are made of, or how they will work, and having nothing to do, but believe that they will do the cure: but in this, are much more miserable than they, in that they are not at liberty to refuse swallowing, what perhaps they had rather let alone; or to choose the physician, to whose conduct they would trust themselves.

§5. Secondly, want of skill to use them. Secondly, those who want skill to use those evidences they have of probabilities; who cannot carry a train of consequences in their heads, nor weigh exactly the preponderancy of contrary proofs and testimonies, making every circumstance its due allowance, may be easily misled to assent to

positions that are not probable. There are some men of one, some but of two syllogisms, and no more; and others that can but advance one step further. These cannot always discern that side on which the strongest proofs lie; cannot constantly follow that which in itself is the more probable opinion. Now that there is such a difference between men, in respect of their understandings, I think nobody, who has had any conversation with his neighbours, will question: though he never was at Westminster Hall, or the Exchange on the one hand; nor at Almshouses, or Bedlam on the other. Which great difference in men's intellectuals, whether it rises from any defect in the organs of the body, particularly adapted to thinking; or in the dullness or untractableness of those faculties, for want of use; or, as some think, in the natural differences of men's souls themselves; or some, or all of these together, it matters not here to examine: only this is evident, that there is a difference of degrees in men's understandings, apprehensions, and reasonings, to so great a latitude, that one may, without doing injury to mankind, affirm, that there is a greater distance between some men, and others, in this respect, than between some men and some beasts. But how this comes about, is a speculation, though of great consequence, yet not necessary to our present purpose.

§6. Thirdly, want of will to use them. Thirdly, there are another sort of people that want proofs, not because they are out of their reach, but because they will not use them: who though they have riches and leisure enough, and want neither parts nor other helps, are yet never the better for them. Their hot pursuit of pleasure, or constant drudgery in business engages some men's thoughts elsewhere: laziness and idleness in general, or a particular aversion for books, study, and meditation keep others from any serious thoughts at all: and some out of fear that an impartial inquiry would not favour those opinions, which best suit their prejudices, lives, and designs, content themselves without examination, to take upon trust, what they find convenient, and in fashion. Thus most men, even of those that might do otherwise, pass their lives without an acquaintance with, much less a rational assent to probabilities, they are concerned to know, though they lie so much within their view, that to be convinced of them, they need but turn their eyes that way. But we know some men will not read a letter, which is supposed to bring ill news; and many men forbear to cast up their accounts, or so much as think upon their estates, who have reason to fear their affairs

are in no very good posture. How men, whose plentiful fortunes allow them leisure to improve their understandings, can satisfy themselves with a lazy ignorance, I cannot tell: but methinks they have a low opinion of their souls, who lay out all their incomes in provisions for the body, and employ none of it to procure the means and helps of knowledge; who take great care to appear always in a neat and splendid outside, and would think themselves miserable in coarse clothes, or a patched coat, and yet contentedly suffer their minds to appear abroad in a piebald livery of coarse patches, and borrowed shreds, such as it has pleased chance, or their country-tailor (I mean the common opinion of those they have conversed with) to clothe them in. I will not here mention how unreasonable this is for men that ever think of a future state, and their concernment in it, which no rational man can avoid to do sometimes: nor shall I take notice what a shame and confusion 'tis, to the greatest contemners of knowledge, to be found ignorant in things they are concerned to know. But this at least is worth the consideration of those who call themselves gentlemen, that, however they may think credit, respect, power, and authority the concomitants of their birth and fortune, yet they will find all these still carried away from them, by men of lower condition who surpass them in knowledge. They who are blind, will always be led by those that see, or else fall into the ditch: and he is certainly the most subjected, the most enslaved, who is so in his understanding. In the foregoing instances, some of the causes have been shown of wrong assent, and how it comes to pass, that probable doctrines are not always received with an assent proportionable to the reasons, which are to be had for their probability: but hitherto we have considered only such probabilities, whose proofs do exist, but do not appear to him who embraces the error.

§7. Fourthly, wrong measures of probability, whereof. Fourthly, There remains yet the last sort, who, even where the real probabilities appear, and are plainly laid before them, do not admit of the conviction, nor yield unto manifest reasons, but do either *εἰ*, *Πε* 'cein, suspend their assent, or give it to the less probable opinion. And to this danger are those exposed, who have taken up wrong measures of probability, which are:

1. Propositions that are not in themselves certain and evident, but doubtful and false, taken up for principles.

2. Received hypotheses.
3. Predominant passions or inclinations.
4. Authority.

§8. First, doubtful propositions taken for principles. First, the first and firmest ground of probability, is the conformity anything has to our own knowledge; especially that part of our knowledge which we have embraced, and continue to look on as principles. These have so great an influence upon our opinions, that 'tis usually by them we judge of truth, and measure probability, to that degree, that what is inconsistent with our principles, is so far from passing for probable with us, that it will not be allowed possible. The reverence borne to these principles is so great, and their authority so paramount to all other, that the testimony, not only of other men, but the evidence of our own senses are often rejected, when they offer to vouch anything contrary to these established rules. How much the doctrine of innate principles, and that principles are not to be proved or questioned, has contributed to this, I will not here examine. This I readily grant, that one truth cannot contradict another: but withal I take leave also to say, that every one ought very carefully to beware what he admits for a principle, to examine it strictly, and see whether he certainly knows it to be true of itself by its own evidence, or whether he does only with assurance believe it to be so, upon the authority of others. For he hath a strong bias put into his understanding, which will unavoidably misguide his assent, who hath imbibed wrong principles, and has blindly given himself up to the authority of any opinion in itself not evidently true.

§9. There is nothing more ordinary, than that children should receive into their minds propositions (especially about matters of religion) from their parents, nurses, or those about them: which being insinuated into their unwary, as well as unbiassed understandings, and fastened by degrees, are at last, (equally, whether true or false) riveted there by long custom and education beyond all possibility of being pulled out again. For men, when they are grown up, reflecting upon their opinions, and finding those of this sort to be as ancient in their minds as their very memories, not having observed their early insinuation, nor by what means they got them, they are apt to reverence them as sacred things, and not to suffer them to be profaned, touched, or questioned: they look on them as the urim and

thummim set up in their minds immediately by God himself, to be the great and unerring deciders of truth and falsehood, and the judges to which they are to appeal in all manner of controversies.

§10. This opinion of his principles (let them be what they will) being once established in anyone's mind, 'tis easy to be imagined, what reception any proposition shall find, how clearly soever proved, that shall invalidate their authority, or at all thwart with these internal oracles; whereas the grossest absurdities and improbabilities, being but agreeable to such principles, go down glibly, and are easily digested. The great obstinacy, that is to be found in men firmly believing quite contrary opinions, though many times equally absurd, in the various religions of mankind, are as evident a proof, as they are an unavoidable consequence of this way of reasoning from received traditional principles. So that men will disbelieve their own eyes, renounce the evidence of their senses, and give their own experience the lie, rather than admit of anything disagreeing with these sacred tenets. Take an intelligent Romanist, that from the very first dawning of any notions in his understanding, hath had this principle constantly inculcated, viz. That he must believe as the church (i.e. those of his communion) believes, or that the Pope is infallible; and this he never so much as heard questioned, till at forty or fifty years old he met with one of other principles; how is he prepared easily to swallow, not only against all probability, but even the clear evidence of his senses, the doctrine of transubstantiation? This principle has such an influence on his mind that he will believe that to be flesh which he sees to be bread. And what way will you take to convince a man of any improbable opinion he holds, who with some philosophers, hath laid down this as a foundation of reasoning, that he must believe his reason (for so men improperly call arguments drawn from their principles) against his senses? Let an enthusiast be principled, that he or his teacher is inspired, and acted by an immediate communication of the divine spirit, and you in vain bring the evidence of clear reasons against his doctrine. Whoever, therefore, have imbibed wrong principles, are not, in things inconsistent with these principles, to be moved by the most apparent and convincing probabilities, till they are so candid and ingenuous to themselves, as to be persuaded to examine even those very principles, which many never suffer themselves to do.

§11. Secondly, received hypotheses. Secondly, next to these, are men whose understandings are cast into a mould, and fashioned just

to the size of a received hypothesis. The difference between these and the former, is, that they will admit of matter of fact, and agree with dissenters in that; but differ only in assigning of reasons, and explaining the manner of operation. These are not at that open defiance with their senses, as the former: they can endure to hearken to their information a little more patiently; but will by no means admit of their reports, in the explanation of things; nor be prevailed on by probabilities, which would convince them, that things are not brought about just after the same manner, that they have decreed within themselves, that they are. Would it not be an insufferable thing for a learned professor, and that which his scarlet would blush at, to have his authority of forty years' standing wrought out of hard rock Greek and Latin, with no small expense of time and candle, and confirmed by general tradition, and a reverend beard, in an instant overturned by an upstart novelist? Can anyone expect that he should be made to confess, that what he taught his scholars thirty years ago, was all error and mistake; and that he sold them hard words and ignorance at a very dear rate? What probabilities, I say, are sufficient to prevail in such a case? And whoever by the most cogent arguments, will be prevailed with, to disrobe himself at once of all his old opinions, and pretences to knowledge and learning, which with hard study, he hath all this time been labouring for; and turn himself out stark naked, in quest afresh of new notions? All the arguments can be used, will be as little able to prevail, as the wind did with the traveller, to part with his cloak, which he held only the faster. To this of wrong hypothesis, may be reduced the errors, that may be occasioned by a true hypothesis, or right principles, but not rightly understood. There is nothing more familiar than this. The instances of men, contending for different opinions, which they all derive from the infallible truth of the Scripture, are an undeniable proof of it. All that call themselves Christians, allow the text, that says, *metanoete*, to carry in it the obligation to a very weighty duty. But yet how ever erroneous will one of their practices be, who understanding nothing but the French, take this rule with one translation to be *repentez-vous*, repent; or with the other, *faites pénitence*, do penance.

§12. Thirdly, predominant passions. Thirdly, Probabilities, which cross men's appetites and prevailing passions, run the same fate. Let ever so much probability hang on one side of a covetous man's reasoning, and money on the other; and 'tis easy to foresee which will outweigh. Earthly minds, like mud walls, resist the strongest batteries:

and though, perhaps, sometimes the force of a clear argument may make some impression, yet they nevertheless stand firm, keep out the enemy truth, that would captivate, or disturb them. Tell a man, passionately in love, that he is jilted; bring a score of witnesses of the falsehood of his mistress, 'tis ten to one but three kind words of hers shall invalidate all their testimonies. 'Quod volumus, facile credimus; what suits our wishes is forwardly believed', is, I suppose, what everyone hath more than once experimented: and though men cannot always openly gainsay, or resist the force of manifest probabilities, that make against them; yet yield they not to the argument. Not but that 'tis the nature of the understanding constantly to close with the more probable side, but yet a man hath a power to suspend and restrain its inquiries, and not permit a full and satisfactory examination, as far as the matter in question is capable, and will bear it to be made. Until that be done, there will be always these two ways left of evading the most apparent probabilities.

§13. The means of evading probabilities, 1st. supposed fallacy. First, that the arguments being (as for the most part they are) brought in words, there may be a fallacy latent in them: and the consequences being, perhaps, many in train, they may be some of them incoherent. There are very few discourses, are so short, clear, and consistent, to which most men may not, with satisfaction enough to themselves, raise this doubt; and from whose conviction they may not, without reproach of disingenuity or unreasonableness, set themselves free with the old reply, 'non persuadebis, etiamsi persuaseris; though I cannot answer, I will not yield.' §14. 2ndly. supposed arguments for the contrary. Secondly, manifest probabilities may be evaded, and the assent withheld upon this suggestion, that I know not yet all that may be said on the contrary side. And therefore, though I be beaten, 'tis not necessary I should yield, not knowing what forces there are in reserve behind. This is a refuge against conviction so open and so wide, that 'tis hard to determine, when a man is quite out of the verge of it.

§15. What probabilities determine the assent. But yet there is some end of it, and a man having carefully inquired into all the grounds of probability and unlikeliness; done his utmost to inform himself in all particulars fairly; and cast up the sum total on both sides, may in most cases come to acknowledge, upon the whole matter, on which side the probability rests: wherein some proofs in

matter of reason, being suppositions upon universal experience, are so cogent and clear; and some testimonies in matter of fact so universal, that he cannot refuse his assent. So that, I think, we may conclude, that in propositions, where though the proofs in view are of most moment, yet there are sufficient grounds, to suspect that there is either fallacy in words, or certain proofs, as considerable, to be produced on the contrary side, there assent, suspense, or dissent, are often voluntary actions. But where the proofs are such as make it highly probable and there is not sufficient ground to suspect, that there is either fallacy of words (which sober and serious consideration may discover) nor equally valid proofs yet undiscovered latent on the other side (which also the nature of the thing may, in some cases, make plain to a considerate man,) there, I think, a man, who has weighed them, can scarce refuse his assent to the side, on which the greater probability appears. Whether it be probable, that a promiscuous jumble of printing letters should often fall into a method and order, which should stamp on paper a coherent discourse; or that a blind fortuitous concourse of atoms, not guided by an understanding agent, should frequently constitute the bodies of any species of animals: in these and the like cases, I think, nobody that considers them, can be one jot at a stand which side to take, nor at all waver in his assent. Lastly, when there can be no supposition, (the thing in its own nature indifferent, and wholly depending upon the testimony of witnesses,) that there is as fair testimony against, as for the matter of fact attested; which by inquiry is to be learned, v.g. whether there was 1700 years ago such a man at Rome as Julius Caesar: in all such cases, I say, I think 'tis not in any rational man's power to refuse his assent; but that it necessarily follows, and closes with such probabilities. In other less clear cases, I think, 'tis in man's power to suspend his assent; and, perhaps, content himself with the proofs he has, if they favour the opinion that suits with his inclination, or interest, and so stop from further search. But that a man should afford his assent to that side, on which the less probability appears to him, seems to me utterly impracticable, and as impossible as 'tis to believe the same thing probable and improbable at the same time.

§16. Where 'tis in our power to suspend it. As knowledge, is no more arbitrary than perception; so, I think, assent is no more in our power than knowledge. When the agreement of any two ideas appears to our minds, whether immediately, or by the assistance of reason, I can no more refuse to perceive, no more avoid knowing it, than I can

avoid seeing those objects, which I turn my eyes to, and look on in daylight: and what upon full examination I find the most probable, I cannot deny my assent to. But though we cannot hinder our knowledge, where the agreement is once perceived; nor our assent, where the probability manifestly appears upon due consideration of all the measures of it: yet we can hinder both knowledge and assent, by stopping our inquiry, and not employing our faculties in the search of any truth. If it were not so, ignorance, error, or infidelity could not in any case be a fault. Thus in some cases, we can prevent or suspend our assent: but can a man, versed in modern or ancient history, doubt whether there be such a place as Rome, or whether there was such a man as Julius Caesar? Indeed there are millions of truths, that a man is not, or may not think himself concerned to know; as whether our king Richard the Third was crook-backed, or no; or whether Roger Bacon was a mathematician, or a magician. In these and such like cases, where the assent one way or other is of no importance to the interest of any one, no action, no concernment of his following, or depending thereon, there 'tis not strange, that the mind should give itself up to the common opinion, or render itself to the first comer. These and the like opinions, are of so little weight and moment, that like motes in the sun, their tendencies are very rarely taken notice of. They are there, as it were, by chance, and the mind lets them float at liberty. But where the mind judges that the proposition has concernment in it; where the assent, or not assenting is thought to draw consequences of moment after it, and good or evil to depend on choosing, or refusing the right side, and the mind sets itself seriously to inquire, and examine the probability: there, I think, 'tis not in our choice, to take which side we please, if manifest odds appear on either. The greater probability, I think, in that case, will determine the assent: and a man can no more avoid assenting, or taking it to be true, where he perceives the greater probability, than he can avoid knowing it to be true, where he perceives the agreement or disagreement of any two ideas.

If this be so, the foundation of error will lie in wrong measures of probability; as the foundation of vice in wrong measures of good.

§17. Fourthly, authority. Fourthly, the fourth and last wrong measure of probability I shall take notice of, and which keeps in ignorance, or error, more people than all the other together, is that which I have mentioned in the foregoing chapter, I mean the giving

up our assent to the common received opinions, either of our friends, or party; neighbourhood or country. How many men have no other ground for their tenets, than the supposed honesty, or learning, or number of those of the same profession' As if honest or bookish men could not err; or truth were to be established by the vote of the multitude: yet this with most men serves the turn. The tenet has had the attestation of reverend antiquity, it comes to me with the passport of former ages, and therefore I am secure in the reception I give it: other men have been, and are of the same opinion, (for that is all is said,) and therefore 'tis reasonable for me to embrace it. A man may more justifiably throw up cross and pile for his opinions, than take them up by such measures. All men are liable to error, and most men are in many points, by passion or interest, under temptation to it. If we could but see the secret motives, that influenced the men of name and learning in the world, and the leaders of parties, we should not always find, that it was the embracing of truth for its own sake, that made them espouse the doctrines they owned and maintained. This at least is certain, there is not an opinion so absurd, which a man may not receive upon this ground. There is no error to be named, which has not had its professors: and a man shall never want crooked paths to walk in, if he thinks that he is in the right way, wherever he has the footsteps of others to follow.

§18. Men not in so many errors as is imagined. But notwithstanding the great noise is made in the world about errors and opinions, I must do mankind that right, as to say, there are not so many men in errors, and wrong opinions, as is commonly supposed. Not that I think they embrace the truth; but indeed, because, concerning those doctrines they keep such a stir about, they have no thought, no opinion at all. For if any one should a little catechize the greatest part of the partizans of most of the sects in the world, he would not find, concerning those matters they are so zealous for, that they have any opinions of their own: much less would he have reason to think, that they took them upon the examination of arguments, and appearance of probability. They are resolved to stick to a party, that education or interest has engaged them in; and there, like the common soldiers of an army, show their courage and warmth as their leaders direct, without ever examining or so much as knowing the cause they contend for. If a man's life shows, that he has no serious regard for religion; for what reason should we think, that he beats his head about the opinions of his church, and troubles himself to examine the

grounds of this or that doctrine' 'Tis enough for him to obey his leaders, to have his hand and his tongue ready for the support of the common cause, and thereby approve himself to those, who can give him credit, preferment, or protection in that society. Thus men become professors of, and combatants for those opinions, they were never convinced of, nor proselytes to; no, nor ever had so much as floating in their heads: And though one cannot say, there are fewer improbable or erroneous opinions in the world than there are; yet this is certain, there are fewer, that actually assent to them, and mistake them for truths, than is imagined.

Chapter XXI Of the Division of the Sciences

§1. Three sorts. All that can fall within the compass of human understanding, being either, first, the nature of things, as they are in themselves, their relations, and their manner of operation: or, secondly, that which man himself ought to do, as a rational and voluntary agent, for the attainment of any end, especially happiness: or, thirdly, the ways and means whereby the knowledge of both the one and the other of these, are attained and communicated; I think, science may be divided properly into these three sorts.

§2. First, *Physica*. First, the knowledge of things, as they are in their own proper beings, their constitution, properties, and operations, whereby I mean not only matter, and body, but spirits also, which have their proper natures, constitutions, and operations as well as bodies. This in a little more enlarged sense of the word, I call φυσικη, or natural philosophy. The end of this, is bare speculative truth, and whatsoever can afford the mind of man any such, falls under this branch, whether it be God himself, angels, spirits, bodies, or any of their affections, as number, and figure, etc.

§3. Secondly, *Practica*. Secondly, πρακτικη, the skill of right applying our own powers and actions, for the attainment of things good and useful. The most considerable under this head, is ethics, which is the seeking out those rules, and measures of human actions, which lead to happiness, and the means to practise them. The end of this is not bare speculation, and the knowledge of truth; but right, and a conduct suitable to it.

§4. Thirdly, σημειωτικη. Thirdly, the third branch may be called

σημε ὡτική, or the doctrine of signs, the most usual whereof being words, 'tis aptly enough termed also λογική, logic: the business whereof, is to consider the nature of signs, the mind makes use of for the understanding of things, or conveying its knowledge to others. For since the things, the mind contemplates are none of them, besides itself, present to the understanding, 'tis necessary that something else, as a sign or representation of the thing it considers, should be present to it: and these are ideas. And because the scene of ideas that makes one man's thoughts cannot be laid open to the immediate view of another, nor laid up anywhere but in the memory, a no very sure repository: therefore to communicate our thoughts to one another, as well as record them for our own use, signs of our ideas are also necessary. Those which men have found most convenient, and therefore generally make use of, are articulate sounds. The consideration, then, of ideas and words, as the great instruments of knowledge, makes no despicable part of their contemplation, who would take a view of human knowledge in the whole extent of it. And, perhaps, if they were distinctly weighed, and duly considered, they would afford us another sort of logic and critique, than what we have been hitherto acquainted with.

§5. This is the first division of the objects of knowledge. This seems to me the first and most general, as well as natural division of the objects of our understanding. For a man can employ his thoughts about nothing, but either, the contemplation of things themselves for the discovery of truth; or about the things in his own power, which are his own actions, for the attainment of his own ends; or the signs the mind makes use of, both in the one and the other, and the right ordering of them for its clearer information. All which three, viz, things as they are in themselves knowable; actions as they depend on us, in order to happiness; and the right use of signs in order to knowledge, being *toto coelo* different, they seemed to me to be the three great provinces of the intellectual world, wholly separate and distinct one from another.

《人类理解论》（An Essay Concerning Human Understanding）的作者是约翰·洛克（John Locke，1632—1704）。

约翰·洛克，英国哲学家、经验主义的创始人，对政治和哲学的发展做出了巨大贡献，是全面论证宪政民主思想的第一人。1632年出生于英国朗灵顿一个乡村律师家庭，早年入威斯敏斯特学院和牛津大学学习，并于1656年获得学士学位，1658年获得硕士学位。后在牛津大学任教，研究医学和哲学。洛克系统学习过的学科领域十分广泛，包括希腊语、文法、希伯来语、历史学、逻辑学、伦理学、修辞学、化学和医学等。1688年成为英国皇家学会会员。他结交广泛，被称为现代化学家之父的波义耳、大名鼎鼎的牛顿都是他的好朋友。洛克继承和发展了唯物主义经验论，否认天赋观念，提出“白纸说”，认为心灵本是一张白纸，一切知识来源于经验（The mind begins as “white paper, void of all characters, without any ideas.”）。但认为经验有两种：对外物作用的感觉和对内心作用的反省。社会政治思想方面，他以自然权利和社会契约论为根据，反对“君权神授”，提出分权说。在宗教观上，他反对宗教狂热，主张宗教宽容，提出政教分离的原则。洛克一生著述颇丰，著有《论宽容》（A Letter Concerning Toleration）、《政府论》（Two Treatise of Government）、《论教育》（Some Thoughts Concerning Education）和《论基督教的合理性》（The Reasonableness of Christianity）等。

《人类理解论》的创写历时20多年，到1671年时已经两易草稿，1686年基本完成书稿。1688年以长篇概要的形式在一家法国期刊发表，1689年（版权日期写为了1690年）全书正式出版，呈现于世人面前。

《人类理解论》出版后反响巨大，好评如潮。此书至洛克去世时共5次修订，5次再版，其中1706年的版本是最终的版本。在1700年被译成法语，1701年被译成拉丁文，在18世纪已经有近24个版本之多。从那时起（尤其在19世纪）至今，此书先后有36个不同形式的英文版本出现，包括“精简本”、“问答评论本”、“问答教材本”、“浓缩本”、“选编本”和“摘要本”等。

在《人类理解论》中，洛克研究人类知识的向度（外延）以及人类理解的本质和范围、动力，显而易见来自他的一种关切，即关于人在万

物安排中（the scheme of things）的位置问题。洛克很自然地相信万物之间有一种安排，相信是全能和明智的上帝把我们安排到了这个世界，上帝使我们相信未来会更好。但是，洛克希望证明，人类理智是上述信仰的基础和依据，并力图解读出这些信仰对我们世俗生活中行为的影响是什么。这种认识看似与洛克自己的“白纸说”有矛盾，但实际并不然。西方大多数思想家、哲学家都信仰宗教和上帝，但上帝在其心目中大多数时候只是一种符号和象征，是人类认识有限相对于无限的一种体现，并不影响他们的思想和研究，更不影响他们的成就。

他的结论是知识局限于观念，这个观念不是柏拉图的理念或形式，而是由我们经验的对象所造成的观念。观念的起源就是经验，经验有两种形式，即感觉和反省。我们的一切观念，毫无例外地，要么通过感官达到我们，使我们体验到了外在于我们的世界，要么通过反省达到我们，这是一个内在于我们的经验。我们只有先有了感觉经验才能有反省经验，只有当心灵被提供观念后它能够开始运作，而这些观念只能来自于感觉。这就意味着每个人的心灵最初就像一张白纸，在这上面只有经验能够书写知识。这就是他著名的“白纸说”（“一张白纸，没有任何文字，没有任何思想”）的依据。他认为，是感觉和反思提供给我们一切理性和知识的材料，我们的心灵由此了解外在的世界。

在此基础上，《人类理解论》向读者详细和系统地论述了人类的理解活动（即理智和心智活动），阐释了我们为何可以逐步获得我们能够获得的知识，并以此形成我们的信仰；以及为何我们不可避免地对知识的认知是有限度的；以及为何我们的知识是可以增进的（尽管我们对知识的认知有限度）。他认为“我们一切的知识，……最终都来自经验”。基于这句话，人们把洛克归类为经验主义者。

洛克的哲学思想对后来的人类历史产生了巨大的影响。“白纸说”揭示了我们来到这个世界上，无需感恩任何既有的权威，唯一影响我们理念和信仰的，是后天的理智和经验，或者说是实践。这种思想，与洛克同一时期出版的《政府论》的思想互相发挥和互为表里。在《政府论》中，洛克认为，生命、自由和私有财产是人神圣不可侵犯的自然权利；为了保护人们依据自然法享有的自然权利，人们通过社会契约建立政府；当政府背叛了人民时，人民有权利收回自己的权力，并有权利重新组建新政府。这些思想成为现代民主社会的思想支柱，对后来的政治发展起到了极大的推动作用。洛克的自由主义思想被美国奉为神圣，成为民族理想。他的思想深深影响了托马斯·杰弗逊等美国政治家，在美洲引发了轰轰烈烈的美国独立战争。洛克的影响在法国则更为剧烈。伏尔泰是第一个将洛克等人的思想传到法国去的人，法国后来的启蒙运动乃至法国大革命都与洛克的思想有直接关系。洛克开创的经验主义被之后的贝克莱以及休谟等人继承和发展，成为欧洲的主流哲学思想之一。

以上是《人类理解论》一书的学术思想价值和社会政治价值。下面我们再谈一下《人类理解论》的语言文学和文字价值。

《人类理解论》自出版以来，早已成为西方大学里的教科书，除了作为宗教、政治、心理等学科的必读书和研究对象之外，这本书也是研究文学、英语语言的人的必读书和研究对象。洛克作为思想大家，他对英语这门语言的驾驭、杰出的思辨力和逻辑力，也是十分出色、令人叫绝的。英国文学史上著名的约翰逊博士（Dr.Johnson），即塞缪尔·约翰逊（Samuel Johnson, 1709—1784），是英国历史上最有名的文人之一，集文学评论家、诗人、散文家、传记作家于一身。他耗费9年时间独力编纂的《约翰逊字典》（A Dictionary of the English Language），是英语史上一部赢得广泛赞誉、影响久远的字典，其中许多内容都直接引证、节取自《人类理解论》。同时，英语文学史上的亚历山大·蒲柏（Alexander Pope, 1688—1744，18世纪英国最伟大的诗人、杰出的启蒙主义者）、劳伦斯·斯特恩（Laurence Sterne, 1713—1768）被认为是最不为规则所囿的18世纪英国小说家）等都是深受洛克的思想、风格和语言影响的人。

我们可以这样归纳：洛克属于所有时代，属于所有的人。

导读

宋京逵

亚里士多德（Aristotle，公元前384年—公元前322年）是第一位使哲学体系化、专业化的哲学家。亚里士多德的哲学可谓是古希腊哲学的顶峰，他在系统地总结了前人的成就上又做出了开创性的贡献。柏拉图说他是“学园的灵魂”，黑格尔说他是“历史上无与伦比的人物”，恩格斯说他是“世界上最博学的人”。他的学术趣味涉及了形而上学、物理学、数学、逻辑学、政治学、伦理学、修辞学乃至生物学。长久以来，他的权威无人能及。在中世纪时，他的地位仅次于圣子耶稣。到了近代，几乎每一项伟大的科学技术的革命，都是踩在亚里士多德的肩膀上前进的。他是人类历史上的一个奇迹。

亚里士多德生于色雷斯地区的斯塔吉拉城，父亲为马其顿宫廷的御医（他可能会为此感到自卑和耻辱）。他17岁去雅典留学，师从于柏拉图。公元前347年柏拉图逝世，他才离开了柏拉图的学园。然后他离开了雅典，前往亚索斯开办了分校。公元前343年，马其顿王菲利普邀请他担任王子亚历山大的老师。7年之后亚历山大即位。关于亚里士多德对亚历山大有什么影响，学界一直存在着争议。不过从亚里士多德的政治学思想和亚历山大的功绩来看，双方很难有多大的关系。亚里士多德在政治上是保守的，他的政治学还处于传统的经典城邦环境中，而对亚历山大建立的希腊化帝国熟视无睹。而且，他所倡导的中道为贵的老学究式思想也很难迎合亚历山大大帝的兴趣。公元前335年，他回到雅典，建立了吕克昂学园。他经常在一条叫做“peripatos”的林中小道上一边散步，一边和学生们讨论哲学问题，因此他的学派也被称作“逍遥学派”（peripatetic）。公元前323年，亚历山大大帝去世，整个希腊化世界开始混乱，雅典人出现了反马其顿情绪，这种情绪涉及了亚里士多德，于是亚里士多德被迫离开了雅典，跑到了爱琴海上的一个岛屿上。他为他的逃跑找了一个冠冕堂皇的理由，他说他逃跑不是怕死，而是避免雅典人再次犯“反哲学罪”（指苏格拉底被判死刑）。他在逃到那个小岛上的第二年逝世。

亚里士多德一生著述丰厚，很多流传下来的著作都是亚里士多德教学用的讲稿，然后再经过整理而成的。亚里士多德有关政治哲学、法学的重要思想，主要体现在其《政治学》和《尼各马可伦理学》的著作中，将两书对照解读能够更加全面地了解亚里士多德的政治哲学。亚里士多德将知识分为理论知识（如形而上学、逻辑学、物理学）和实践知识（如政治学、伦理学）。前者研究的是不变的、永恒的关于自然的知识，后者研究的是可变的、关于人类事务的知识。一般研究亚里士多德的政治哲学和法学思想也都重点对《政治学》、《尼各马可伦理学》进行分析，本篇导读也是如此。

一般认为亚里士多德在《政治学》中的根本思想是对城邦的自然性进行辩护。即认为城邦是自然生成的，是符合人类本性的非违背人类本性的东西。在古希腊人眼里，自然并不是像现代人理解的那样一种外部环境。自然具有目的论性质。每一存在物都有一种最适合于其自身的存在方式、样式，这种存在方式就是符合其自然本性的那种运动或生成。所以，对于古希腊人来说，自然的就是善的，事物的自然就是它的目的、它的善。^[1]与自然相对的是习俗，习俗是那些根据人为活动而产生的东西。习俗是低于自然的。自然是先天不变的，习俗是后天可变的。自然的是源初的，习俗的是派生的。^[2]

古希腊哲学家们争论的焦点在于，城邦、法律或者说正义，这些人类生活中至关重要的东西，究竟是源于自然的，还是仅仅源于习俗？在智者派眼里，城邦生活、政治都仅仅是习俗的、人为制订的东西。他们认为，为集体利益而限制个人利益、并且服从法律和正义，这是不符合人类本性的，人类的本性都只是照顾各自的利益而不顾公共利益，甚至是为了满足自己的利益而侵犯他人的利益。他们将人与动物作比较，说在动物界中那种优胜劣汰的自然选择才是真正的自然，而正义只不过是一种伪装，真正的正义其实指的就是强者的利益。^[3]亚里士多德在《政治学》里面的主要任务就是要反对智者派的这种观点，并且为城邦的自然性提供论据。

亚里士多德

亚里士多德对城邦的自然性的辩护主要依据两条思路。一是通过论证城邦的自然生成来论证城邦的自然性。人为了免于匮乏、为了过上自足的生活，就必然地会结合成家庭，家庭再结合成聚集的村落，然后再由村落聚集为城邦。如果家庭、村落的产生都是自然形成的，那么由它们而产生的城邦也是自然的。只有在城邦中，人才能成为自给自足，才能成为整全的存在。城邦是整体，而人只是部分，人脱离了城邦某种意义上就不再是人，恰如手臂如果脱离了身体就不再是手臂一样。^[4]亚里士多德的这一论证思路，一般被认为他是一种城邦的有机体论的支持者。但是在稍后我将表明，这种对亚里士多德的理解只是流于表面。

此外还有另外一条论证思路。即通过重新澄清人的自然本性即人存在的目的入手，来思考城邦的本性。在《尼各马可伦理学》中，亚里士多德已经表明了人的最高幸福（即人的自然）是什么，即灵魂符合最高德性的实现活动。^[5]在《政治学》中，亚里士多德又说城邦生活的目的是为了促成人的德性的发展。^[6]这样看来，由于城邦生活满足了人的自然本性这一目的，因而城邦本身就成为自然的了。

在第二条思路中，我们可以发现亚里士多德对于自然的理解完全不同于智者派。智者派把自然等同于天生的，即完全着眼于初始、发生，而亚里士多德则着眼于目的、趋向。人与动物存在着根本的不同。对于动物来说，它们只能根据自己天生的生物本能来行动，按照某种必然性来行动。而人则具有理性，人是理性的、逻各斯的动物，能够通过言辞来形成关于正确与错误、好与坏的判断，然后再依此判断来行事。^[7]在《尼各马可伦理学》中，亚里士多德专门强调了道德德性——这种因习俗而成的德性——的独特地位，道德德性是一种出乎自然而又不违反自然的东西。^[8]它对人类实现自身的最高幸福——自身潜能的完善——有着重要意义。因而对于人这种理性的动物来说，他的习俗即是自然。人的自然就是通过运用理性，形成对与错的判断，从而自己为自己立法。

值得注意的是，这两条论证思路相互之间看上去有一些互相矛盾的地方。第一种论证思路是从城邦自身的自然性中来为其辩护的，城邦相对于人来说更是目的。在第二种论证思路中，城邦则只是通过服务于人的德性的发展才得到辩护，因而人相对于城邦来说更是目的。第一种论

证要求人更应该服从于城邦，服从于城邦的整体利益。而第二种论证则更注重人德性自身的完善，也就是注重个体的善，要求城邦为人服务。这两种论证在某种程度上都是合理的，因此亚里士多德需要在二者之间达成一种平衡，亚里士多德的整部《政治学》都是在这种城邦与人的张力之中来展开各种论述的。^[9]

前文已经说过亚里士多德并不是一个城邦有机体论的支持者，虽然亚里士多德强调城邦相对于人更自足。但是亚里士多德并不支持完全为了城邦自身的完善而牺牲个人，一个最完善的城邦，一个具备了最优良政体的城邦，并不见得有利于人的德性最充分的实现。在《政治学》第二卷里面，亚里士多德就是依据第二种论证的基础，批判了柏拉图笔下的苏格拉底在《理想国》中的那种共产共妻的制度设想。在苏格拉底看来，最完善的城邦应该是一种最为稳定的城邦，也就是公共利益被最广泛地认同的城邦，这就要求城邦的共同利益不应被私人利益所分化。于是，苏格拉底通过某种制度设计，迫使人们以公共利益为先，有效地发扬了城邦的公共精神。但这里的问题是，苏格拉底的这种最好政体的制度设计不但没能够实现培育人的德性的这一功能，反而使得人的德性成为没有必要的了。比如说财产公有这一制度，使得人的慷慨这一德性的发展成为多余的，只有建立在私有制的基础上、只有在承认人有私心的这一基础上，慷慨这一德性才有存在的必要，因为人必定是通过克服自己的私心、将自己私人所有的东西拿出来与大家分享才能被称为慷慨。因而看来，某种私心、某种自利恰恰是慷慨这样的德性的前提条件。包括苏格拉底那种建议儿童由集体来抚养，不让他们知道自己亲生父母的制度设计也有同样的问题。虽然苏格拉底的本意是想让儿童从小就培育起公共意识，把每一个城邦中的陌生人都当成自己可能的父亲母亲那样来对待，但是这样一来同样也剥夺了儿童通过自我意识来发展其公共精神的机会。^[10]在讨论人的德性的时候，亚里士多德一直强调选择的意义，选择不同于欲望，仅为有逻各斯的人所具有。能够选择是合乎德性的行为的必要条件之一（注意，“选择”是，但“知道”并不是）。^[11]如果一种制度设计取代了人的选择，那么即便这种制度再好，那也是不可欲的。虽然这种制度设计可能保证人达到有德性的状态，但是人真正的善意味着通过有德性的行动来形成一种稳定的品质，而不仅仅是处于有德性的状态之中。恰如奥林匹克的桂冠会授予那些在竞赛中表现最优越

者，而不是给那些身体最健美的人。^[12]因而我们可以看到柏拉图的那种理想国的根本问题是什么。在理想国中，城邦的完善压倒了人的完善，哲人王凭借自己过人的智慧设计的政体强迫人民达到利他的德性状态，而剥夺了他们选择的能力。城邦不同于家庭，城邦应该是平等自由的人之间的依法统治，而不同于主人统治奴隶、家长统治妇女儿童那样的专制统治、君主统治。^[13]城邦的本性就是多样化的。^[14]

亚里士多德的批判并没有止步于柏拉图笔下的苏格拉底，在其后，亚里士多德又通过批判希波达莫斯的观点，更进一步显示了他自己对于政治的理解。希波达莫斯作为一个发明家，把政治的技艺简单与其他手工艺等同起来。因而片面地强调在城邦中创新，并且通过立法奖励那些有所发明创造的人。对此，亚里士多德的意见是，城邦生活需要稳定，法律不应该过于追求创新和改革。为了保持法律、城邦的稳定，即便旧习存在着一些弊端，也应该容忍。法律需要人们的顺从，但是法律却无法强迫人们顺从。因此法律需要长时间的积淀，才能使人们形成顺从的习惯。希波达莫斯不满足于法律的一般性，因为这种一般性是以牺牲个别案件的独特性、丧失了治理的精确性为代价的。但是为了法律的效力、城邦生活的稳定，丧失这种精确性是必要的。希波达莫斯以数学的那种精确性来要求政制、法律的精确是不可能的，只能取得适得其反的效果。因为人的自然本性就不可能接受这种精确性的政制安排，城邦中的政治统治是自由人之间的统治，人自由的行动必然地会产生某种模糊。因而指望着完全通过一套理性设计出来的政制调整人的行为，是不现实的。^[15]通过对希波达莫斯的批判，亚里士多德不仅显示出政治的独特性，也显示出了政治学的独特性。政治学是最为权威的科学，因为它关心整个城邦生活，并且指导着其他门类的科学。^[16]政治学需要研究某一种科学是不是有益于城邦生活，它所涉及的领域最广泛，几乎包含一切人类活动。因此它也包含了政治学者本身研究政治的活动，政治学要研究政治学者们的研究活动，即政治学本身是否有益于城邦。结果对于我们来说已经清楚了，政治学本身可能对于政治、城邦生活的稳定是有威胁的，如柏拉图笔下的苏格拉底、希波达莫斯这类的学者过于理性化的追求，可能会对城邦造成负面影响。政治学应该是一种有自我反思意识的科学，这与哲学的要求一样（即苏格拉底所说的认识你自己）。政治学者本身都是生活在城邦之中的，这就要求政治学者们在进行研究活

动并宣传自己的主张的时候十分小心谨慎、节制自己的言行。政治学者们不能无顾忌地运用自己的理性去挑战城邦中人民的意见。^[17]强调这一点十分重要，因为在亚里士多德看来，理性从根本上就是源于意见的，亚里士多德并没有一种后来阿奎那自然法的思想，认为人只要通过运用上帝给予我们的理性，就能发现本就已经先于我们存在的、由上帝烙印在我们心灵中的自然法。在亚里士多德那里，那种超越于人的、为人类行为提供指导的普遍自然法则是不存在的，因而理性不是通过发现、接近、达到那种自然法而成其为理性，理性是通过超越意见、超越人的常识判断而成其为理性。^[18]因而理性依赖于自由人表达自己的意见为前提，理性只能在综合分析审视各种意见的基础上，通过升华各种意见才能成为可靠的知识。^[19]如此一来，像柏拉图笔下的苏格拉底、希波达莫斯那样以理性来压倒人们通常的意见的做法，就是一种理性的自戕行为。为了获得知识、为了实现人自身理性的潜能（而这一潜能的实现也就是人的目的、人的善、人的自然本性），必须允许自由的人表达自己的意见，但是这一表达意见自由的结果，当然与理想化的最完善的城邦的一致性、公共性的要求是矛盾的。城邦必定是多元的。人不能被严格地设定为城邦的某一个部分，被设定为只会遵照固定的规则行动的工蜂。柏拉图笔下的苏格拉底、希波达莫斯，都将城邦中的人依照其职能严格地划分为各种部分，让其机械地履行这一部分对于城邦整体的职能，这对于人的自然本性来说是不可能的。

秉持着上述这些基本观点，亚里士多德从第三卷开始具体分析各种政体的优劣。城邦的同一源自政体的同一，而政体则是基于城邦公民对于某种德性的共同理解。因而考察一种政体某种意义上就是考察这种政体下的公民们所重视的德性是什么。但问题是人们对于德性总有不同的标准。而且“善良之人的德性与良好公民的德性是不同的”，公民的德性是什么取决于其所属的城邦的政体是什么，不同的政体尊重不同的德性，而善良之人的德性则是始终如一而非相对的。^[20]公民德性首先要求公民个体服务于城邦整体，而城邦整体又总是要求公民的价值观与城邦的价值观相符。对于城邦中公民应该赞美什么、应该蔑视什么，公民应有共同的标准。被公民一致赞美的人，肯定就是该城邦中公民德性的典范，就意味着他拥有作为统治者的资格。也就是说，被赞美者应成为统治者，而被蔑视者就成为被统治者。这种统治与被统治的划分如果是

适当的，就意味着公平这一德性在城邦中实现了。公平意味着“对平等者给予平等对待，对不平等者给予不平等对待”。但亚里士多德又紧接着说，“人们在自己的事情上总是糟糕的判断者”，人们往往会高估自己所拥有的德性的分量，认为其他人都应该尊重自己。“那些在某一方面（譬如财富）与他人不平等时，便认为自己在总的方面都与众不同或不平等；而那些在某一方面（譬如自由）与人平等时，便认为自己在总的方面也与人平等。”^[21]由此看来，任何一种政体中蕴含着的对于公平的理解都只是上文所说的一种意见，真正的知识必须源于这种意见，但同时又必须超越这种意见。这些不同的对公平的理解都各自有一定的理由，但同时也都有不合理的地方。^[22]亚里士多德分别讨论了各种政体的正确与错误的地方。平民政体能够让更多的人分享平等与自由，但是容易沦为暴民统治，即大多数穷人以多数名义侵占少数富人的财产。寡头政体要求财富数量达到一定程度者才能有资格成为统治者，富人拥有更多的闲暇来发展德性，且更易于通过捐献来换取荣誉，但是富人也往往容易变得骄傲虚荣，并且鼓励了城邦中的公民的贪婪物欲之心。即便是以德性为划分标准让最贤明的人去统治，也会带有一定的负面影响。首先是排除了大多数人于荣誉与资格之外，其次就是少数贤明的人在智慧与德性的总体上不见得优于大多数不太贤明的人的总和。在谈到君主制时，亚里士多德又坦陈人治不如法治，并且列举了法治优越的多种因素所在。这样看来，所有政体所依据的公平观念、德性观念都只是部分正确的，这些特殊的德性观念虽然希望能够代表整体城邦的利益，但事实上都只是代表了城邦中一部分人的利益，而且在同一个城邦中不同的人群会提出相互冲突的公正的要求。^[23]于是，依据德性的共同认知不仅无法给城邦带来稳定，还会给城邦造成持续的冲突与不稳定，甚至各种政体的变更也是经常的事情。

针对此种情况，亚里士多德指出了矫正的方针，提出了一种基于现有政体基础上的通过改善而成的尽可能好的政体，即共和政体。共和政体是一种混合型的政体，即要求寡头政体中融入平民政体的因素，在平民政体中融入寡头政体的因素，好的共和政体会让人的判断产生混乱，会认为这种政体既是平民政体又是寡头政体。^[24]这样一种混合式的政体在中产阶级强大的城邦最容易实现，因为中产阶级恰恰拥有中庸、适度的那种德性。在亚里士多德看来，真正的城邦生活需要公民们对于公

正的追求具有适当的节制，虽说人的德性的发展要依赖于城邦，但是城邦的稳定又要求人在追求德性时不得过度。城邦中的部分不能自以为公正而要求过度的权力，而是必须学会与城邦的其他部分妥协。在《尼各马可伦理学》中，亚里士多德全面地描述了中庸的品性。中庸不是一种普世的、不变的标准，它总是伴随着人在具体情况下的具体判断。^[25]因而现实可行的最好的政体，也要依赖于人的不断思考、不断判断以及不断的适当的微调改善。

亚里士多德虽然在《政治学》开头就强调了城邦的自然性，但是从后面几卷开始，就逐一分析了各种现存的城邦，或者哲学家们设计的城邦的缺陷。城邦的自然性并不能保证优良的城邦可以自然而然地建立。由于人的自由的本性，人在森然的自然等级秩序中的位置似乎是模糊的。^[26]城邦并不是给人提供了一个真正安稳的归属所在，城邦只是给人提供了一个平台，人需要在这个平台之上自己寻找关于什么是正义、什么是优良生活、什么是人的自然本性这一系列问题的答案。城邦迫使人必须要在自由与服从、个体与整体之间进行深刻的思考。对于人自身的有限性形成一个清醒的认识。因而，政治生活在某种意义上就是哲学生活的翻版。^[27]哲学是一种爱智慧的活动，而不是智慧本身。政治也与之相似，人之所以能在政治生活中获得自身最大潜能的实现，是因为人在政治生活中会产生困惑并且思考这种困惑。人需要在政治中不断地寻求答案而不是自以为一劳永逸地发现了答案。正因为如此，施特劳斯才会说，人性的实现需要依赖于城邦但又要超越于城邦，世界上只有最完善的人，而却没有最完善的城邦。^[28]

BOOK ONE

导 读

在第一卷中，亚里士多德通过对城邦的生成、城邦对于人的价值的论述，表明了城邦几乎无可置疑的自然属性。然而，如果真要想证明城邦与人的自然本性的切合，亚里士多德就必须详细地分析城邦生活之中那些看上去不太自然的东西，如为了集体生活所必不可少的统治与被统治的关系，以及促进城邦繁荣的商业贸易问题。对这些不太自然的东西的分析，使得亚里士多德最初的那个论断更加复杂化了。

在卷初，看上去亚里士多德是要开篇明义，断定城邦是自然的、符合人的本性的。个人的所有行为都是为了某种目的、某种善，而个人组成共同体这一行为所谋划的则是一种共同的善、公共的善。城邦作为所有共同体中最崇高、最权威者，其所追求的善也是最为普遍、广泛意义上的人类目的。因而人类参与到城邦生活之中，是最符合自己的善、本性的。理由很简单，个体是无法靠单个人的力量获得自足的，人必须依靠他人的帮助才能免于匮乏。所以个体的人会自然而然地结合为家庭，再由家庭结合为村落，最后再由村落结合为城邦。这一不断聚集的过程不但是人的自足性不断加深的过程，同时也是人的德性不断完满的过程，甚至也是人之所以成为人的过程。只有神和野兽不需要城邦生活，人具体天生的社会本能，因而只有在城邦生活之中，人的这种自然、本能才会充分发展起来。因而人不可能脱离城邦生活，不可能脱离城邦的法律。

但是，这里需要表明，人可不能脱离于城邦，并不意味着城邦就可以以集体的名义完全压制个体的利益，约束个体的自由。城邦完全不同于家庭之中的父权的统治、主奴的统治，而是自由人、平等的人之间的统治。这种自由与平等根源于人是唯一的有理性、有语言的逻各斯的动物。语言注重于互相的交流，理性意味着互相的可理解性。因而人的这种语言、理性交流的交互能力意味着人天生应是处于平等的状态的。所以说人类城邦从根本上不同于蜂巢或者蚁穴，蜜蜂和蚂蚁也有着极强的

组织性，但是它们的这种组织性是一种非反思的、没有理性的组织，而人则可以通过理性的思考，思考正义与善的定义，然后再依据着自己对于正义、善的理解来自己统治自己。

不过，由于人的自由与平等源于人具有理性的天赋这一事实，那么反过来说，如果某些人不具备这种理性的话，那么他也就自然不享有自由、平等的权利。由此亚里士多德论证了奴隶制的合法性。奴隶就是那些天生不具有自主的理性，但是可以感受别人的理性的人，这种人是天生的、自然的奴隶。因此，亚里士多德对于自由平等的理解完全不同于现代自由主义者。现代自由主义者理解的自由是一种普遍意义上的自然权利，而亚里士多德的自由平等则是一种特权。随后，亚里士多德还将这种自然的不平等扩大到一切事物之上，在所有个别事物中都包含有统治的元素以及被统治的元素。不平等是自然的，因而政治上的不平等决定于这种自然的不平等。

可是，亚里士多德也承认，现实中的奴隶并不都是那种天生的自然奴隶，也有通过战争而被俘获的习俗上的奴隶，这种习俗的奴隶并不是出于自然上的低劣，而仅仅是因为战败而沦为奴隶。自然原本的设计是，提供给人充足的自然资源，让人能够通过获取食物的致富术得到这些自然所提供的礼物。获取的技术根据其对象不同分为多种，如畜牧、农耕、捕鱼、狩猎甚至是掠夺。值得注意的是，为了获取足够的资源，人们通常混合各种获取方式。此外，掠夺竟然也是一种亚里士多德认可的方式，战争技术也是一种自然的技术，用来捕获野兽和那些天生应该服从而不愿意服从的。这种天生应该由人来管理而又不愿臣服的人，似乎并不太符合亚里士多德关于自然奴隶的定义，因为自然奴隶应该是天性愿意顺从主人的人。而前文又已提及，战争获取的习俗的奴隶也是大量存在的。这表明，人似乎为了满足基本的需要，迫不得已要想尽一切办法获取足够的生活品。如混合多种获取方式以及通过不公正的战争迫使本性自由的人沦为自己的奴隶。如此一来，似乎自然对于人来说并非是丰盛的，而是匮乏的。为了改变自身处于匮乏状态的基本处境，人似乎就必须通过各种人为的技艺来满足自己的需要。因而亚里士多德接下来就自然谈到了另外一种致富术，即以货币为基础的商业交换。^[1]

初看上去，这种致富术不可能是自然的，因为它打破了人的满足的

自然限制。尤其是发展到极端形态的高利贷，鼓励了人的无穷的贪欲，与发展人的德性的要求不符。但是谁都不可否认，这种人为的致富术确实给城邦带来了财富，后世亚当·斯密所论证的专业分工以及贸易所带来的繁荣，其实早在《理想国》中就已经被柏拉图笔下的苏格拉底多多少少提及了，亚里士多德必然也清楚这种致富术的好处；以及在没有这种致富术下人类的悲惨处境，竟然连掠夺也是一种自然的获取技术；以及人被迫要学会多种的获取术，而不能像在商业贸易中的那样专攻一技。而根据柏拉图，专攻一技对于城邦及人的正义来说似乎又是必不可少的。

在第一卷的开篇，亚里士多德所断定的城邦的那种自然性，似乎在随后的论述中又变得有疑问了。与其说城邦是自然的，不如说城邦自始就处于自然与人为的张力之中。因而人对于政治的思考，也必须带着困惑、在这种张力中展开。

Part I

Every state is a community of some kind, and every community is established with a view to some good^[2]; for mankind always act in order to obtain that which they think good. But, if all communities aim at some good, the state or political community, which is the highest of all, and which embraces all the rest, aims at good in a greater degree than any other, and at the highest good.

Some people think that the qualifications of a statesman, king, house-holder, and master are the same, and that they differ, not in kind, but only in the number of their subjects. For example, the ruler over a few is called a master; over more, the manager of a household; over a still larger number, a statesman or king, as if there were no difference between a great household and a small state. The distinction which is made between the king and the statesman is as follows: When the government is personal, the ruler is a king; when, according to the rules of the political science, the citizens rule and are ruled in turn, then he is called a statesman.

But all this is a mistake; for governments differ in kind, as will be evident to anyone who considers the matter according to the method which has hitherto guided us. As in other departments of science, so in politics, the compound should always be resolved into the simple elements or least parts of the whole. We must therefore look at the elements of which the state is composed, in order that we may see in what the different kinds of rule differ from one another, and whether any scientific result can be attained about each one of them.

Part II

He who thus considers things in their first growth and origin, whether a state or anything else, will obtain the clearest view of them. In the first place there must be a union of those who cannot exist without each other; namely, of male and female, that the race may continue (and this is a union which is formed, not of deliberate purpose, but because, in common with other animals and with plants, mankind have a natural desire to leave behind them an image of themselves), and of natural ruler and subject, that both may be preserved. For that which can foresee by the exercise of mind is by nature intended to be lord and master, and that which can with its body give effect to such foresight is a subject, and by nature a slave; hence master and slave have the same interest. Now nature has distinguished between the female and the slave. For she is not niggardly, like the smith who fashions the Delphian knife for many uses; she makes each thing for a single use, and every instrument is best made when intended for one and not for many uses. But among barbarians no distinction is made between women and slaves, because there is no natural ruler among them: they are a community of slaves, male and female. Wherefore the poets say,

“It is meet that Hellenes should rule over barbarians;”

as if they thought that the barbarian and the slave were by nature one.

Out of these two relationships between man and woman, master and slave, the first thing to arise is the family, and Hesiod is right when he says,

“First house and wife and an ox for the plough,”

for the ox is the poor man's slave. The family is the association established by nature for the supply of men's everyday wants, and the

members of it are called by Charondas “companions of the cupboard,” and by Epimenides the Cretan, “companions of the manger.” But when several families are united, and the association aims at something more than the supply of daily needs, the first society to be formed is the village. And the most natural form of the village appears to be that of a colony from the family, composed of the children and grandchildren, who are said to be suckled “with the same milk.” And this is the reason why Hellenic states were originally governed by kings; because the Hellenes were under royal rule before they came together, as the barbarians still are. Every family is ruled by the eldest, and therefore in the colonies of the family the kingly form of government prevailed because they were of the same blood. As Homer says:

“Each one gives law to his children and to his wives.”

For they lived dispersedly, as was the manner in ancient times. Wherefore men say that the Gods have a king, because they themselves either are or were in ancient times under the rule of a king. For they imagine, not only the forms of the Gods, but their ways of life to be like their own.

When several villages are united in a single complete community, large enough to be nearly or quite self-sufficing, the state comes into existence, originating in the bare needs of life, and continuing in existence for the sake of a good life. And therefore, if the earlier forms of society are natural, so is the state, for it is the end of them, and the nature^[3] of a thing is its end. For what each thing is when fully developed, we call its nature, whether we are speaking of a man, a horse, or a family. Besides, the final cause and end of a thing is the best, and to be self-sufficing is the end and the best.

Hence it is evident that the state is a creation of nature, and that man is by nature a political animal. And he who by nature and not by

mere accident is without a state, is either a bad man or above humanity; he is like the

“Tribeless, lawless, hearthless one,”

whom Homer denounces—the natural outcast is forthwith a lover of war; he may be compared to an isolated piece at draughts.

Now, that man is more of a political animal than bees or any other gregarious animals is evident. Nature, as we often say, makes nothing in vain, and man is the only animal whom she has endowed with the gift of speech. And whereas mere voice is but an indication of pleasure or pain, and is therefore found in other animals (for their nature attains to the perception of pleasure and pain and the intimation of them to one another, and no further), the power of speech is intended to set forth the expedient and inexpedient, and therefore likewise the just and the unjust. And it is a characteristic of man that he alone has any sense of good and evil, of just and unjust, and the like, and the association of living beings who have this sense makes a family and a state.

Further, the state is by nature clearly prior to the family and to the individual, since the whole is of necessity prior to the part; for example, if the whole body be destroyed, there will be no foot or hand, except in an equivocal sense, as we might speak of a stone hand; for when destroyed the hand will be no better than that. But things are defined by their working and power; and we ought not to say that they are the same when they no longer have their proper quality, but only that they have the same name. The proof that the state is a creation of nature and prior to the individual is that the individual, when isolated, is not self-sufficing; and therefore he is like a part in relation to the whole. But he who is unable to live in society, or who has no need because he is sufficient for himself, must be either a beast or a god: he is no part of a state. A social instinct is implanted

in all men by nature, and yet he who first founded the state was the greatest of benefactors. For man, when perfected, is the best of animals, but, when separated from law and justice, he is the worst of all; since armed injustice is the more dangerous, and he is equipped at birth with arms, meant to be used by intelligence and virtue, which he may use for the worst ends. Wherefore, if he have not virtue, he is the most unholy and the most savage of animals, and the most full of lust and gluttony. But justice is the bond of men in states, for the administration of justice, which is the determination of what is just, is the principle of order in political society.

Part III

Seeing then that the state is made up of households, before speaking of the state we must speak of the management of the household. The parts of household management correspond to the persons who compose the household, and a complete household consists of slaves and freemen. Now we should begin by examining everything in its fewest possible elements; and the first and fewest possible parts of a family are master and slave, husband and wife, father and children. We have therefore to consider what each of these three relations is and ought to be: I mean the relation of master and servant, the marriage relation (the conjunction of man and wife has no name of its own), and thirdly, the procreative relation (this also has no proper name). And there is another element of a household, the so-called art of getting wealth, which, according to some, is identical with household management, according to others, a principal part of it; the nature of this art will also have to be considered by us.

古希腊盲诗人荷马。相传记述公元前12世纪—公元前11世纪特洛伊战争及有关海上冒险故事的古希腊长篇叙事史诗《伊利亚特》和《奥德赛》，即是他根据民间流传的短歌综合编写而成。

Let us first speak of master and slave, looking to the needs of practical life and also seeking to attain some better theory of their relation than exists at present. For some are of opinion that the rule of a master is a science, and that the management of a household, and the mastership of slaves, and the political and royal rule, as I was saying at the outset, are all the same. Others affirm that the rule of a master over slaves is contrary to nature, and that the distinction between slave and freeman exists by law only, and not by nature; and being an interference with nature is therefore unjust.

Part IV

Property is a part of the household, and the art of acquiring property is a part of the art of managing the household; for no man can live well, or indeed live at all, unless he be provided with necessaries. And as in the arts which have a definite sphere the workers must have their own proper instruments for the accomplishment of their work, so it is in the management of a household. Now instruments are of various sorts; some are living, others lifeless; in the rudder, the pilot of a ship has a lifeless, in the lookout man, a living instrument; for in the arts the servant is a kind of instrument. Thus, too, a possession is an instrument for maintaining life. And so, in the arrangement of the family, a slave is a living possession, and property a number of such instruments; and the servant is himself an instrument which takes precedence of all other instruments. For if every instrument could accomplish its own work, obeying or anticipating the will of others, like the statues of Daedalus, or the tripods of Hephaestus, which, says the poet,

“of their own accord entered the assembly of the Gods;”

if, in like manner, the shuttle would weave and the plectrum touch the lyre without a hand to guide them, chief workmen would not want servants, nor masters slaves. Here, however, another distinction must be drawn; the instruments commonly so called are instruments of production, whilst a possession is an instrument of action. The shuttle, for example, is not only of use; but something else is made by it, whereas of a garment or of a bed there is only the use. Further, as production and action are different in kind, and both require instruments, the instruments which they employ must likewise differ in kind. But life is action and not production, and therefore the slave is the minister of action. Again, a possession is spoken of as a part is

spoken of; for the part is not only a part of something else, but wholly belongs to it; and this is also true of a possession. The master is only the master of the slave; he does not belong to him, whereas the slave is not only the slave of his master, but wholly belongs to him. Hence we see what is the nature and office of a slave; he who is by nature not his own but another's man, is by nature a slave; and he may be said to be another's man who, being a human being, is also a possession. And a possession may be defined as an instrument of action, separable from the possessor.

Part V

But is there anyone thus intended by nature to be a slave, and for whom such a condition is expedient and right, or rather is not all slavery a violation of nature?

There is no difficulty in answering this question, on grounds both of reason and of fact. For that some should rule and others be ruled is a thing not only necessary, but expedient; from the hour of their birth, some are marked out for subjection, others for rule.

And there are many kinds both of rulers and subjects (and that rule is the better which is exercised over better subjects—for example, to rule over men is better than to rule over wild beasts; for the work is better which is executed by better workmen, and where one man rules and another is ruled, they may be said to have a work); for in all things which form a composite whole and which are made up of parts, whether continuous or discrete, a distinction between the ruling and the subject element comes to light. Such a duality exists in living creatures, but not in them only; it originates in the constitution of the universe; even in things which have no life there is a ruling principle, as in a musical mode. But we are wandering from the subject. We will therefore restrict ourselves to the living creature, which, in the first place, consists of soul and body: and of these two, the one is by nature the ruler, and the other the subject. But then we must look for the intentions of nature in things which retain their nature, and not in things which are corrupted. And therefore we must study the man who is in the most perfect state both of body and soul, for in him we shall see the true relation of the two; although in bad or corrupted natures the body will often appear to rule over the soul, because they are in an evil and unnatural condition. At all events we may firstly observe in living creatures both a despotal and a constitutional rule;

for the soul rules the body with a despotical rule, whereas the intellect rules the appetites with a constitutional and royal rule. And it is clear that the rule of the soul over the body, and of the mind and the rational element over the passionate, is natural and expedient; whereas the equality of the two or the rule of the inferior is always hurtful. The same holds good of animals in relation to men; for tame animals have a better nature than wild, and all tame animals are better off when they are ruled by man; for then they are preserved. Again, the male is by nature superior, and the female inferior; and the one rules, and the other is ruled; this principle, of necessity, extends to all mankind.

Where then there is such a difference as that between soul and body, or between men and animals (as in the case of those whose business is to use their body, and who can do nothing better), the lower sort are by nature slaves, and it is better for them as for all inferiors that they should be under the rule of a master. For he who can be, and therefore is, another's and he who participates in rational principle enough to apprehend, but not to have, such a principle, is a slave by nature. Whereas the lower animals cannot even apprehend a principle; they obey their instincts. And indeed the use made of slaves and of tame animals is not very different; for both with their bodies minister to the needs of life. Nature would like to distinguish between the bodies of freemen and slaves, making the one strong for servile labor, the other upright, and although useless for such services, useful for political life in the arts both of war and peace. But the opposite often happens—that some have the souls and others have the bodies of freemen. And doubtless if men differed from one another in the mere forms of their bodies as much as the statues of the Gods do from men, all would acknowledge that the inferior class should be slaves of the superior. And if this is true of the body, how much more just that a similar distinction should exist in the soul? but the beauty of the body is seen, whereas the beauty of the soul is not seen. It is clear,

then, that some men are by nature free, and others slaves, and that for these latter slavery is both expedient and right.

Part VI

But that those who take the opposite view have in a certain way right on their side, may be easily seen. For the words slavery and slave are used in two senses. There is a slave or slavery by law as well as by nature. The law of which I speak is a sort of convention—the law by which whatever is taken in war is supposed to belong to the victors. But this right many jurists impeach, as they would an orator who brought forward an unconstitutional measure: they detest the notion that, because one man has the power of doing violence and is superior in brute strength, another shall be his slave and subject. Even among philosophers there is a difference of opinion. The origin of the dispute, and what makes the views invade each other's territory, is as follows: in some sense virtue, when furnished with means, has actually the greatest power of exercising force; and as superior power is only found where there is superior excellence of some kind, power seems to imply virtue, and the dispute to be simply one about justice (for it is due to one party identifying justice with goodwill while the other identifies it with the mere rule of the stronger). If these views are thus set out separately, the other views have no force or plausibility against the view that the superior in virtue ought to rule, or be master. Others, clinging, as they think, simply to a principle of justice (for law and custom are a sort of justice), assume that slavery in accordance with the custom of war is justified by law, but at the same moment they deny this. For what if the cause of the war be unjust? And again, no one would ever say he is a slave who is unworthy to be a slave. Were this the case, men of the highest rank would be slaves and the children of slaves if they or their parents chance to have been taken captive and sold. Wherefore Hellenes do not like to call Hellenes slaves, but confine the term to barbarians. Yet, in using this language, they really mean the natural slave of whom we spoke at first; for it must be admitted that some are slaves everywhere, others nowhere.

The same principle applies to nobility. Hellenes regard themselves as noble everywhere, and not only in their own country, but they deem the barbarians noble only when at home, thereby implying that there are two sorts of nobility and freedom, the one absolute, the other relative. The Helen of Theodectes says:

“Who would presume to call me servant who am on both sides sprung from the stem of the Gods?”

What does this mean but that they distinguish freedom and slavery, noble and humble birth, by the two principles of good and evil? They think that as men and animals beget men and animals, so from good men a good man springs. But this is what nature, though she may intend it, cannot always accomplish.

We see then that there is some foundation for this difference of opinion, and that all are not either slaves by nature or freemen by nature, and also that there is in some cases a marked distinction between the two classes, rendering it expedient and right for the one to be slaves and the others to be masters: the one practicing obedience, the others exercising the authority and lordship which nature intended them to have. The abuse of this authority is injurious to both; for the interests of part and whole, of body and soul, are the same, and the slave is a part of the master, a living but separated part of his bodily frame. Hence, where the relation of master and slave between them is natural they are friends and have a common interest, but where it rests merely on law and force the reverse is true.

Part VII

The previous remarks are quite enough to show that the rule of a master is not a constitutional rule, and that all the different kinds of rule are not, as some affirm, the same with each other. For there is one rule exercised over subjects who are by nature free, another over subjects who are by nature slaves. The rule of a household is a monarchy, for every house is under one head: whereas constitutional rule is a government of freemen and equals. The master is not called a master because he has science, but because he is of a certain character, and the same remark applies to the slave and the freeman. Still there may be a science for the master and science for the slave. The science of the slave would be such as the man of Syracuse taught, who made money by instructing slaves in their ordinary duties. And such a knowledge may be carried further, so as to include cookery and similar menial arts. For some duties are of the more necessary, others of the more honorable sort; as the proverb says, “slave before slave, master before master.” But all such branches of knowledge are servile. There is likewise a science of the master, which teaches the use of slaves; for the master as such is concerned, not with the acquisition, but with the use of them. Yet this so-called science is not anything great or wonderful; for the master need only know how to order that which the slave must know how to execute. Hence those who are in a position which places them above toil have stewards who attend to their households while they occupy themselves with philosophy or with politics. But the art of acquiring slaves, I mean of justly acquiring them, differs both from the art of the master and the art of the slave, being a species of hunting or war. Enough of the distinction between master and slave.

Part VIII

Let us now inquire into property generally, and into the art of getting wealth, in accordance with our usual method, for a slave has been shown to be a part of property. The first question is whether the art of getting wealth is the same with the art of managing a household or a part of it, or instrumental to it; and if the last, whether in the way that the art of making shuttles is instrumental to the art of weaving, or in the way that the casting of bronze is instrumental to the art of the statuary, for they are not instrumental in the same way, but the one provides tools and the other material; and by material I mean the substratum out of which any work is made; thus wool is the material of the weaver, bronze of the statuary. Now it is easy to see that the art of household management is not identical with the art of getting wealth, for the one uses the material which the other provides. For the art which uses household stores can be no other than the art of household management. There is, however, a doubt whether the art of getting wealth is a part of household management or a distinct art. If the getter of wealth has to consider whence wealth and property can be procured, but there are many sorts of property and riches, then are husbandry, and the care and provision of food in general, parts of the wealthgetting art or distinct arts? Again, there are many sorts of food, and therefore there are many kinds of lives both of animals and men; they must all have food, and the differences in their food have made differences in their ways of life. For of beasts, some are gregarious, others are solitary; they live in the way which is best adapted to sustain them, accordingly as they are carnivorous or herbivorous or omnivorous: and their habits are determined for them by nature in such a manner that they may obtain with greater facility the food of their choice. But, as different species have different tastes, the same things are not naturally pleasant to all of them; and therefore the lives of carnivorous or herbivorous animals further differ among

themselves. In the lives of men too there is a great difference. The laziest are shepherds, who lead an idle life, and get their subsistence without trouble from tame animals; their flocks having to wander from place to place in search of pasture, they are compelled to follow them, cultivating a sort of living farm. Others support themselves by hunting, which is of different kinds. Some, for example, are brigands, others, who dwell near lakes or marshes or rivers or a sea in which there are fish, are fishermen, and others live by the pursuit of birds or wild beasts. The greater number obtain a living from the cultivated fruits of the soil. Such are the modes of subsistence which prevail among those whose industry springs up of itself, and whose food is not acquired by exchange and retail trade— there is the shepherd, the husbandman, the brigand, the fisherman, the hunter. Some gain a comfortable maintenance out of two employments, eking out the deficiencies of one of them by another: thus the life of a shepherd may be combined with that of a brigand, the life of a farmer with that of a hunter. Other modes of life are similarly combined in any way which the needs of men may require. Property, in the sense of a bare livelihood, seems to be given by nature herself to all, both when they are first born, and when they are grown up. For some animals bring forth, together with their offspring, so much food as will last until they are able to supply themselves; of this the vermiparous or oviparous animals are an instance; and the viviparous animals have up to a certain time a supply of food for their young in themselves, which is called milk. In like manner we may infer that, after the birth of animals, plants exist for their sake, and that the other animals exist for the sake of man, the tame for use and food, the wild, if not all at least the greater part of them, for food, and for the provision of clothing and various instruments. Now if nature makes nothing incomplete, and nothing in vain, the inference must be that she has made all animals for the sake of man. And so, in one point of view, the art of war is a natural art of acquisition, for the art of acquisition includes hunting, an art which we ought to practice against wild beasts, and

against men who, though intended by nature to be governed, will not submit; for war of such a kind is naturally just.

Of the art of acquisition then there is one kind which by nature is a part of the management of a household, in so far as the art of household management must either find ready to hand, or itself provide, such things necessary to life, and useful for the community of the family or state, as can be stored. They are the elements of true riches; for the amount of property which is needed for a good life is not unlimited, although Solon in one of his poems says that

“No bound to riches has been fixed for man.”

But there is a boundary fixed, just as there is in the other arts; for the instruments of any art are never unlimited, either in number or size, and riches may be defined as a number of instruments to be used in a household or in a state. And so we see that there is a natural art of acquisition which is practiced by managers of households and by statesmen, and what is the reason of this.

Part IX

There is another variety of the art of acquisition which is commonly and rightly called an art of wealth-getting, and has in fact suggested the notion that riches and property have no limit. Being nearly connected with the preceding, it is often identified with it. But though they are not very different, neither are they the same. The kind already described is given by nature, the other is gained by experience and art.

Let us begin our discussion of the question with the following considerations:

Of everything which we possess there are two uses: both belong to the thing as such, but not in the same manner, for one is the proper, and the other the improper or secondary use of it. For example, a shoe is used for wear, and is used for exchange; both are uses of the shoe. He who gives a shoe in exchange for money or food to him who wants one, does indeed use the shoe as a shoe, but this is not its proper or primary purpose, for a shoe is not made to be an object of barter. The same may be said of all possessions, for the art of exchange extends to all of them, and it arises at first from what is natural, from the circumstance that some have too little, others too much. Hence we may infer that retail trade is not a natural part of the art of getting wealth; had it been so, men would have ceased to exchange when they had enough. In the first community, indeed, which is the family, this art is obviously of no use, but it begins to be useful when the society increases. For the members of the family originally had all things in common; later, when the family divided into parts, the parts shared in many things, and different parts in different things, which they had to give in exchange for what they wanted, a kind of barter which is still practiced among barbarous

nations who exchange with one another the necessities of life and nothing more; giving and receiving wine, for example, in exchange for coin, and the like. This sort of barter is not part of the wealth-getting art and is not contrary to nature, but is needed for the satisfaction of men's natural wants. The other or more complex form of exchange grew, as might have been inferred, out of the simpler. When the inhabitants of one country became more dependent on those of another, and they imported what they needed, and exported what they had too much of, money necessarily came into use. For the various necessities of life are not easily carried about, and hence men agreed to employ in their dealings with each other something which was intrinsically useful and easily applicable to the purposes of life, for example, iron, silver, and the like. Of this the value was at first measured simply by size and weight, but in process of time they put a stamp upon it, to save the trouble of weighing and to mark the value.

When the use of coin had once been discovered, out of the barter of necessary articles arose the other art of wealth-getting, namely, retail trade; which was at first probably a simple matter, but became more complicated as soon as men learned by experience whence and by what exchanges the greatest profit might be made. Originating in the use of coin, the art of getting wealth is generally thought to be chiefly concerned with it, and to be the art which produces riches and wealth; having to consider how they may be accumulated. Indeed, riches is assumed by many to be only a quantity of coin, because the arts of getting wealth and retail trade are concerned with coin. Others maintain that coined money is a mere sham, a thing not natural, but conventional only, because, if the users substitute another commodity for it, it is worthless, and because it is not useful as a means to any of the necessities of life, and, indeed, he who is rich in coin may often be in want of necessary food. But how can that be wealth of which a man may have a great abundance and yet perish with hunger, like Midas in the fable, whose insatiable prayer turned everything that was set

before him into gold?

Hence men seek after a better notion of riches and of the art of getting wealth than the mere acquisition of coin, and they are right. For natural riches and the natural art of wealth-getting are a different thing; in their true form they are part of the management of a household; whereas retail trade is the art of producing wealth, not in every way, but by exchange. And it is thought to be concerned with coin; for coin is the unit of exchange and the measure or limit of it. And there is no bound to the riches which spring from this art of wealth-getting. As in the art of medicine there is no limit to the pursuit of health, and as in the other arts there is no limit to the pursuit of their several ends, for they aim at accomplishing their ends to the uttermost (but of the means there is a limit, for the end is always the limit), so, too, in this art of wealth-getting there is no limit of the end, which is riches of the spurious kind, and the acquisition of wealth. But the art of wealth-getting which consists in household management, on the other hand, has a limit; the unlimited acquisition of wealth is not its business. And, therefore, in one point of view, all riches must have a limit; nevertheless, as a matter of fact, we find the opposite to be the case; for all getters of wealth increase their hoard of coin without limit. The source of the confusion is the near connection between the two kinds of wealth-getting; in either, the instrument is the same, although the use is different, and so they pass into one another; for each is a use of the same property, but with a difference: accumulation is the end in the one case, but there is a further end in the other. Hence some persons are led to believe that getting wealth is the object of household management, and the whole idea of their lives is that they ought either to increase their money without limit, or at any rate not to lose it. The origin of this disposition in men is that they are intent upon living only, and not upon living well; and, as their desires are unlimited they also desire that the means of gratifying them should be without limit. Those who do aim at a good

life seek the means of obtaining bodily pleasures; and, since the enjoyment of these appears to depend on property, they are absorbed in getting wealth: and so there arises the second species of wealth-getting. For, as their enjoyment is in excess, they seek an art which produces the excess of enjoyment; and, if they are not able to supply their pleasures by the art of getting wealth, they try other arts, using in turn every faculty in a manner contrary to nature. The quality of courage, for example, is not intended to make wealth, but to inspire confidence; neither is this the aim of the general's or of the physician's art; but the one aims at victory and the other at health. Nevertheless, some men turn every quality or art into a means of getting wealth; this they conceive to be the end, and to the promotion of the end they think all things must contribute.

Thus, then, we have considered the art of wealth-getting which is unnecessary, and why men want it; and also the necessary art of wealth-getting, which we have seen to be different from the other, and to be a natural part of the art of managing a household, concerned with the provision of food, not, however, like the former kind, unlimited, but having a limit.

Part X

And we have found the answer to our original question, Whether the art of getting wealth is the business of the manager of a household and of the statesman or not their business? viz., that wealth is presupposed by them. For as political science does not make men, but takes them from nature and uses them, so too nature provides them with earth or sea or the like as a source of food. At this stage begins the duty of the manager of a household, who has to order the things which nature supplies; he may be compared to the weaver who has not to make but to use wool, and to know, too, what sort of wool is good and serviceable or bad and unserviceable. Were this otherwise, it would be difficult to see why the art of getting wealth is a part of the management of a household and the art of medicine not; for surely the members of a household must have health just as they must have life or any other necessary. The answer is that as from one point of view the master of the house and the ruler of the state have to consider about health, from another point of view not they but the physician; so in one way the art of household management, in another way the subordinate art, has to consider about wealth. But, strictly speaking, as I have already said, the means of life must be provided beforehand by nature; for the business of nature is to furnish food to that which is born, and the food of the offspring is always what remains over of that from which it is produced. Wherefore the art of getting wealth out of fruits and animals is always natural.

There are two sorts of wealth-getting, as I have said; one is a part of household management, the other is retail trade: the former necessary and honorable, while that which consists in exchange is justly censured; for it is unnatural, and a mode by which men gain from one another. The most hated sort, and with the greatest reason, is usury, which makes a gain out of money itself, and not from the

natural object of it. For money was intended to be used in exchange, but not to increase at interest. And this term interest, which means the birth of money from money, is applied to the breeding of money because the offspring resembles the parent. Wherefore of all modes of getting wealth this is the most unnatural.

Part XI

Enough has been said about the theory of wealth-getting; we will now proceed to the practical part. The discussion of such matters is not unworthy of philosophy, but to be engaged in them practically is illiberal and irksome. The useful parts of wealth-getting are, first, the knowledge of livestock—which are most profitable, and where, and how—as, for example, what sort of horses or sheep or oxen or any other animals are most likely to give a return. A man ought to know which of these pay better than others, and which pay best in particular places, for some do better in one place and some in another. Secondly, husbandry, which may be either tillage or planting, and the keeping of bees and of fish, or fowl, or of any animals which may be useful to man. These are the divisions of the true or proper art of wealth-getting and come first. Of the other, which consists in exchange, the first and most important division is commerce (of which there are three kinds—the provision of a ship, the conveyance of goods, exposure for sale—these again differing as they are safer or more profitable), the second is usury, the third, service for hire—of this, one kind is employed in the mechanical arts, the other in unskilled and bodily labor. There is still a third sort of wealth-getting intermediate between this and the first or natural mode which is partly natural, but is also concerned with exchange, viz., the industries that make their profit from the earth, and from things growing from the earth which, although they bear no fruit, are nevertheless profitable; for example, the cutting of timber and all mining. The art of mining, by which minerals are obtained, itself has many branches, for there are various kinds of things dug out of the earth. Of the several divisions of wealth-getting I now speak generally; a minute consideration of them might be useful in practice, but it would be tiresome to dwell upon them at greater length now.

Those occupations are most truly arts in which there is the least element of chance; they are the meanest in which the body is most deteriorated, the most servile in which there is the greatest use of the body, and the most illiberal in which there is the least need of excellence.

Works have been written upon these subjects by various persons; for example, by Chares the Parian, and Apollodorus the Lemnian, who have treated of Tillage and Planting, while others have treated of other branches; any one who cares for such matters may refer to their writings. It would be well also to collect the scattered stories of the ways in which individuals have succeeded in amassing a fortune; for all this is useful to persons who value the art of getting wealth. There is the anecdote of Thales the Milesian and his financial device, which involves a principle of universal application, but is attributed to him on account of his reputation for wisdom. He was reproached for his poverty, which was supposed to show that philosophy was of no use. According to the story, he knew by his skill in the stars while it was yet winter that there would be a great harvest of olives in the coming year; so, having a little money, he gave deposits for the use of all the olive-presses in Chios and Miletus, which he hired at a low price because no one bid against him.

When the harvest-time came, and many were wanted all at once and of a sudden, he let them out at any rate which he pleased, and made a quantity of money. Thus he showed the world that philosophers can easily be rich if they like, but that their ambition is of another sort. He is supposed to have given a striking proof of his wisdom, but, as I was saying, his device for getting wealth is of universal application, and is nothing but the creation of a monopoly. It is an art often practiced by cities when they are want of money; they make a monopoly of provisions.

There was a man of Sicily, who, having money deposited with

him, bought up all the iron from the iron mines; afterwards, when the merchants from their various markets came to buy, he was the only seller, and without much increasing the price he gained 200 per cent. Which when Dionysius heard, he told him that he might take away his money, but that he must not remain at Syracuse, for he thought that the man had discovered a way of making money which was injurious to his own interests. He made the same discovery as Thales; they both contrived to create a monopoly for themselves. And statesmen as well ought to know these things; for a state is often as much in want of money and of such devices for obtaining it as a household, or even more so; hence some public men devote themselves entirely to finance.

Part XII

Of household management we have seen that there are three parts—one is the rule of a master over slaves, which has been discussed already, another of a father, and the third of a husband. A husband and father, we saw, rules over wife and children, both free, but the rule differs, the rule over his children being a royal, over his wife a constitutional rule. For although there may be exceptions to the order of nature, the male is by nature fitter for command than the female, just as the elder and full-grown is superior to the younger and more immature. But in most constitutional states the citizens rule and are ruled by turns, for the idea of a constitutional state implies that the natures of the citizens are equal, and do not differ at all. Nevertheless, when one rules and the other is ruled we endeavor to create a difference of outward forms and names and titles of respect, which may be illustrated by the saying of Amasis about his foot-pan. The relation of the male to the female is of this kind, but there the inequality is permanent. The rule of a father over his children is royal, for he rules by virtue both of love and of the respect due to age, exercising a kind of royal power. And therefore Homer has appropriately called Zeus “father of Gods and men,” because he is the king of them all. For a king is the natural superior of his subjects, but he should be of the same kin or kind with them, and such is the relation of elder and younger, of father and son.

Part XIII

Thus it is clear that household management attends more to men than to the acquisition of inanimate things, and to human excellence more than to the excellence of property which we call wealth, and to the virtue of freemen more than to the virtue of slaves. A question may indeed be raised, whether there is any excellence at all in a slave beyond and higher than merely instrumental and ministerial qualities—whether he can have the virtues of temperance, courage, justice, and the like; or whether slaves possess only bodily and ministerial qualities. And, whichever way we answer the question, a difficulty arises; for, if they have virtue, in what will they differ from freemen? On the other hand, since they are men and share in rational principle, it seems absurd to say that they have no virtue. A similar question may be raised about women and children, whether they too have virtues: ought a woman to be temperate and brave and just, and is a child to be called temperate, and intemperate, or not? So in general we may ask about the natural ruler, and the natural subject, whether they have the same or different virtues. For if a noble nature is equally required in both, why should one of them always rule, and the other always be ruled? Nor can we say that this is a question of degree, for the difference between ruler and subject is a difference of kind, which the difference of more and less never is. Yet how strange is the supposition that the one ought, and that the other ought not, to have virtue! For if the ruler is intemperate and unjust, how can he rule well? If the subject, how can he obey well? If he be licentious and cowardly, he will certainly not do his duty. It is evident, therefore, that both of them must have a share of virtue, but varying as natural subjects also vary among themselves. Here the very constitution of the soul has shown us the way; in it one part naturally rules, and the other is subject, and the virtue of the ruler we maintain to be different from that of the subject; the one being the virtue of the

rational, and the other of the irrational part. Now, it is obvious that the same principle applies generally, and therefore almost all things rule and are ruled according to nature. But the kind of rule differs; the freeman rules over the slave after another manner from that in which the male rules over the female, or the man over the child; although the parts of the soul are present in an of them, they are present in different degrees. For the slave has no deliberative faculty at all; the woman has, but it is without authority, and the child has, but it is immature. So it must necessarily be supposed to be with the moral virtues also; all should partake of them, but only in such manner and degree as is required by each for the fulfillment of his duty. Hence the ruler ought to have moral virtue in perfection, for his function, taken absolutely, demands a master artificer, and rational principle is such an artificer; the subjects, on the other hand, require only that measure of virtue which is proper to each of them. Clearly, then, moral virtue belongs to all of them; but the temperance of a man and of a woman, or the courage and justice of a man and of a woman, are not, as Socrates maintained, the same; the courage of a man is shown in commanding, of a woman in obeying. And this holds of all other virtues, as will be more clearly seen if we look at them in detail, for those who say generally that virtue consists in a good disposition of the soul, or in doing rightly, or the like, only deceive themselves. Far better than such definitions is their mode of speaking, who, like Gorgias, enumerate the virtues. All classes must be deemed to have their special attributes; as the poet says of women,

“Silence is a woman's glory,”

but this is not equally the glory of man. The child is imperfect, and therefore obviously his virtue is not relative to himself alone, but to the perfect man and to his teacher, and in like manner the virtue of the slave is relative to a master. Now we determined that a slave is useful for the wants of life, and therefore he will obviously require

only so much virtue as will prevent him from failing in his duty through cowardice or lack of self-control. Someone will ask whether, if what we are saying is true, virtue will not be required also in the artisans, for they often fail in their work through the lack of self-control? But is there not a great difference in the two cases? For the slave shares in his master's life; the artisan is less closely connected with him, and only attains excellence in proportion as he becomes a slave. The meaner sort of mechanic has a special and separate slavery; and whereas the slave exists by nature, not so the shoemaker or other artisan. It is manifest, then, that the master ought to be the source of such excellence in the slave, and not a mere possessor of the art of mastership which trains the slave in his duties. Wherefore they are mistaken who forbid us to converse with slaves and say that we should employ command only, for slaves stand even more in need of admonition than children.

So much for this subject; the relations of husband and wife, parent and child, their several virtues, what in their intercourse with one another is good, and what is evil, and how we may pursue the good and escape the evil, will have to be discussed when we speak of the different forms of government. For, inasmuch as every family is a part of a state, and these relationships are the parts of a family, and the virtue of the part must have regard to the virtue of the whole, women and children must be trained by education with an eye to the constitution, if the virtues of either of them are supposed to make any difference in the virtues of the state. And they must make a difference: for the children grow up to be citizens, and half the free persons in a state are women.

Of these matters, enough has been said; of what remains, let us speak at another time. Regarding, then, our present inquiry as complete, we will make a new beginning. And, first, let us examine the various theories of a perfect state.

[2] Good：福祉、好处、善，在当代政治哲学中，善往往与正当或权利这两个概念相对应。善是在古典政治哲学中衡量、评价政制好坏的最高标准。而正当则是现代自由民主制国家的基本原则。简单来说，善是以人的目的性来着眼，认为政治的目标是帮助人发展、实现美德或者某种特定的价值。而权利则抛开了人的目的性，而是从人的基本需求、欲望着眼。当代政治哲学认为政治的目标只是保护人的这种基本权利，而人的目的性只是个人私人的生活方式问题，因而只有赖于个人自己的选择，国家不应该过问。国家不能依靠强制来决定究竟哪一种生活方式是最高的、最优越的，国家应该在诸种生活方式中保持中立。这样的政治组织原则就可以称为正当。

[3] Nature：自然、本性。在古希腊哲学的语境中，不仅指某一物自然存在的方式，也指其运动、生长的自然趋向的目的。一个树种的自然就是它要生长成为大树。某物的自然存在方式、趋向目的，也是其最理想的存在方式，因此说某物依据其自然存在，不仅仅是意味一种物理、生物学的存在方式，而是带有肯定的价值评价。因而言一物是自然的，往往也意味着说此物是善的。在亚里士多德看来，人的自然就是要在城邦生活中培育出德性。

BOOK TWO

导 读

亚里士多德认为对于最好的政体的研究不能仅是空谈，而应对那些实际存在的政体以及被人称颂的理想政体进行翔实认真的分析，列举出优点与不足。在此基础上，我们才能得到关于最好政体的信息。亚里士多德还指出，到目前为止，那些实际存在的政体，以及被人们理论上所称颂的政体，都有弊端。第二卷的主要任务因而就是对于各种现存的政体以及理论学说进行批判。在这种批判中，也就显示出了亚里士多德心中理想政体的基本形态。

第一个被批判的对象也是最重要的人物，正是亚里士多德的老师柏拉图。亚里士多德猛烈地抨击了在柏拉图《理想国》中苏格拉底提出的那个最正义的城邦的基本原则。柏拉图笔下的苏格拉底为了建立最正义的城邦，几乎完全地废除了人类私欲的可能性，通过共产共妻，使得人们只能为了城邦的公共利益而活。因而对于柏拉图来说最好的城邦就是那种最整齐划一的城邦。这种整齐划一的城邦建立在城邦公民的人性单一的假定上。为了保证城邦的公共利益的最大化，公民的德性只能是功能性的，而不可能得到全面的发展。而亚里士多德认为，城邦的本质应该是多元化的，城邦的目的就应该是容纳不同种类不同本性的人组成一个以互惠为原则的共同体。正是因为城邦可以包容多元利益，所以城邦才成为优越于家庭、村落的最高的共同体。在此基础上，亚里士多德也就自然不会同意《理想国》中最好的城邦的严格的等级制了，为了保证互惠性，城邦的最高权力也应该是由平等的公民分享和轮流统治的。

废除私有制还有另外一个大问题，即不管是妻儿的共有还是财产的共有，都只会导致大家对于公共利益的淡漠，因为越多的人共有一件事物，人们对这一事物的关心也就越少。亚里士多德的论证跟现代经济学家讲的公有地的悲剧有相似之处。但亚里士多德跟现代经济学家们的不同之处在于，他认为公有制不利于人们德性的培养，公有制的问题在于以某种制度设计代替了人类自身发展德性、克制自己私欲的机会。这不

符合城邦的目的。城邦的目的是服务于人的德性的发展和实现，而不是相反。因而在财产问题的态度上，亚里士多德支持私人所有而公共分享，即对公共利益的保证并不是依靠一种制度设计，而是依靠着个人的慷慨的德性。

亚里士多德对于柏拉图的批判是具有代表意义的。在亚里士多德看来，政治生活本身是复杂的、多元化的，与理性所要求的整齐划一和简单明了可能天然就存在着矛盾。一些本来出于良好意愿的制度设计在实际实施之后，反而会得到完全相反的负面结果，而这种结果在设计之时完全是无法预料到的。这也就是亚里士多德具有保守主义倾向的政治观的根本所在。在批判希波达莫斯时，亚里士多德这一观点表现得更为突出。希波达莫斯的三分法的划分表明他对于理性的追求已经达到偏执的程度，而亚里士多德接下来通过分析指出这种三分法在实际生活中则会导致无数的问题和麻烦。此外，希波达莫斯将政治与其他技艺混淆，认为政治像其他技艺一样需要不断的革新、完善自身。而在亚里士多德看来，政治生活必须建立在稳定基础上，法律需要被人们习惯性地服从，而习惯本身只能通过长时间的积累才有可能，不断的变革会破坏人们对于习惯的服从，从而根本上破坏城邦生活的稳定性。这种理性化的错误某种意义上是由于忽视了人性的复杂性，费勒亚斯以为只要保证财产的平均分配，就能够保证城邦的稳定，但亚里士多德随后指出需要平均的并不是财产而是人类的欲望，正是因为人类欲望的复杂性，使得简简单单的财产平均分配不可能解决全部问题。^[1]

接下来，亚里士多德开始对实际存在的城邦进行分析，分别以克里特、斯巴达和迦太基为分析的对象。随后又谈到了梭伦的立法。亚里士多德所有的分析都暗含了同样的观点，即城邦原本的政制的最初宗旨往往会在漫长的实践中产生变化，导致一些不好的负面影响出现。如斯巴达人忽视了对妇女德性的培养，斯巴达、克里特的长老制可能会随着长老年龄的增大而产生弊端，迦太基原本贵族制的宗旨可能反而会鼓励人们沉溺于贪财享乐，梭伦设立的平民陪审法庭可能会沦为暴民政体。

所有这些都反映出了政治的复杂性、城邦生活的易变性和不可预测性。正是对这一点的清醒的认识，才决定了亚里士多德对于政治的小心审慎，以及对于在将理性用于城邦规划中的节制的态度。

Part I

Our purpose is to consider what form of political community is best of all for those who are most able to realize their ideal of life. We must therefore examine not only this but other constitutions, both such as actually exist in well-governed states, and any theoretical forms which are held in esteem; that what is good and useful may be brought to light. And let no one suppose that in seeking for something beyond them we are anxious to make a sophistical display at any cost; we only undertake this inquiry because all the constitutions with which we are acquainted are faulty.

We will begin with the natural beginning of the subject. Three alternatives are conceivable: The members of a state must either have (1) all things or (2) nothing in common, or (3) some things in common and some not. That they should have nothing in common is clearly impossible, for the constitution is a community, and must at any rate have a common place—one city will be in one place, and the citizens are those who share in that one city. But should a well ordered state have all things, as far as may be, in common, or some only and not others? For the citizens might conceivably have wives and children and property in common, as Socrates proposes in the *Republic*^[2] of Plato. Which is better, our present condition, or the proposed new order of society.

Part II

There are many difficulties in the community of women. And the principle on which Socrates rests the necessity of such an institution evidently is not established by his arguments. Further, as a means to the end which he ascribes to the state, the scheme, taken literally is impracticable, and how we are to interpret it is nowhere precisely stated. I am speaking of the premise from which the argument of Socrates proceeds, "that the greater the unity of the state the better." Is it not obvious that a state may at length attain such a degree of unity as to be no longer a state? since the nature of a state is to be a plurality, and in tending to greater unity, from being a state, it becomes a family, and from being a family, an individual; for the family may be said to be more than the state, and the individual than the family. So that we ought not to attain this greatest unity even if we could, for it would be the destruction of the state. Again, a state is not made up only of so many men, but of different kinds of men; for similars do not constitute a state. It is not like a military alliance The usefulness of the latter depends upon its quantity even where there is no difference in quality (for mutual protection is the end aimed at), just as a greater weight of anything is more useful than a less (in like manner, a state differs from a nation, when the nation has not its population organized in villages, but lives an Arcadian sort of life); but the elements out of which a unity is to be formed differ in kind. Wherefore the principle of compensation, as I have already remarked in the *Ethics*, is the salvation of states. Even among freemen and equals this is a principle which must be maintained, for they cannot an rule together, but must change at the end of a year or some other period of time or in some order of succession. The result is that upon this plan they all govern; just as if shoemakers and carpenters were to exchange their occupations, and the same persons did not always continue shoemakers and carpenters. And since it is better that this

should be so in politics as well, it is clear that while there should be continuance of the same persons in power where this is possible, yet where this is not possible by reason of the natural equality of the citizens, and at the same time it is just that all should share in the government (whether to govern be a good thing or a bad), an approximation to this is that equals should in turn retire from office and should, apart from official position, be treated alike. Thus the one party rule and the others are ruled in turn, as if they were no longer the same persons. In like manner when they hold office there is a variety in the offices held. Hence it is evident that a city is not by nature one in that sense which some persons affirm; and that what is said to be the greatest good of cities is in reality their destruction; but surely the good of things must be that which preserves them. Again, in another point of view, this extreme unification of the state is clearly not good; for a family is more self-sufficing than an individual, and a city than a family, and a city only comes into being when the community is large enough to be self-sufficing. If then self-sufficiency is to be desired, the lesser degree of unity is more desirable than the greater.

Part III

But, even supposing that it were best for the community to have the greatest degree of unity, this unity is by no means proved to follow from the fact “of all men saying ‘mine’ and ‘not mine’ at the same instant of time,” which, according to Socrates, is the sign of perfect unity in a state. For the word “all” is ambiguous. If the meaning be that every individual says “mine” and “not mine” at the same time, then perhaps the result at which Socrates aims may be in some degree accomplished; each man will call the same person his own son and the same person his wife, and so of his property and of all that falls to his lot. This, however, is not the way in which people would speak who had their wives and children in common; they would say “all” but not “each.” In like manner their property would be described as belonging to them, not severally but collectively. There is an obvious fallacy in the term “all”: like some other words, “both,” “odd,” “even,” it is ambiguous, and even in abstract argument becomes a source of logical puzzles. That all persons call the same thing mine in the sense in which each does so may be a fine thing, but it is impracticable; or if the words are taken in the other sense, such a unity in no way conduces to harmony. And there is another objection to the proposal. For that which is common to the greatest number has the least care bestowed upon it. Every one thinks chiefly of his own, hardly at all of the common interest; and only when he is himself concerned as an individual. For besides other considerations, everybody is more inclined to neglect the duty which he expects another to fulfill; as in families many attendants are often less useful than a few. Each citizen will have a thousand sons who will not be his sons individually but anybody will be equally the son of anybody, and will therefore be neglected by all alike. Further, upon this principle, everyone will use the word “mine” of one who is prospering or the reverse, however small a fraction he may himself be of the whole

number; the same boy will be “so and so's son,” the son of each of the thousand, or whatever be the number of the citizens; and even about this he will not be positive; for it is impossible to know who chanced to have a child, or whether, if one came into existence, it has survived. But which is better—for each to say “mine” in this way, making a man the same relation to two thousand or ten thousand citizens, or to use the word “mine” in the ordinary and more restricted sense? For usually the same person is called by one man his own son whom another calls his own brother or cousin or kinsman—blood relation or connection by marriage either of himself or of some relation of his, and yet another his clansman or tribesman; and how much better is it to be the real cousin of somebody than to be a son after Plato's fashion! Nor is there any way of preventing brothers and children and fathers and mothers from sometimes recognizing one another; for children are born like their parents, and they will necessarily be finding indications of their relationship to one another. Geographers declare such to be the fact; they say that in part of Upper Libya, where the women are common, nevertheless the children who are born are assigned to their respective fathers on the ground of their likeness. And some women, like the females of other animals—for example, mares and cows—have a strong tendency to produce offspring resembling their parents, as was the case with the Pharsalian mare called Honest.

苏格拉底（公元前469年—公元前399年），古希腊著名的思想家、哲学家、教育家。他和他的学生柏拉图以及柏拉图的学生亚里士多德被并称为“古希腊三贤”。

Part IV

Other evils, against which it is not easy for the authors of such a community to guard, will be assaults and homicides, voluntary as well as involuntary, quarrels and slanders, all which are most unholy acts when committed against fathers and mothers and near relations, but not equally unholy when there is no relationship. Moreover, they are much more likely to occur if the relationship is unknown, and, when they have occurred, the customary expiations of them cannot be made. Again, how strange it is that Socrates, after having made the children common, should hinder lovers from carnal intercourse only, but should permit love and familiarities between father and son or between brother and brother, than which nothing can be more unseemly, since even without them love of this sort is improper. How strange, too, to forbid intercourse for no other reason than the violence of the pleasure, as though the relationship of father and son or of brothers with one another made no difference.

This community of wives and children seems better suited to the husbandmen than to the guardians, for if they have wives and children in common, they will be bound to one another by weaker ties, as a subject class should be, and they will remain obedient and not rebel. In a word, the result of such a law would be just the opposite of which good laws ought to have, and the intention of Socrates in making these regulations about women and children would defeat itself. For friendship we believe to be the greatest good of states and the preservative of them against revolutions; neither is there anything which Socrates so greatly lauds as the unity of the state which he and all the world declare to be created by friendship. But the unity which he commends would be like that of the lovers in the *Symposium*, who, as Aristophanes says, desire to grow together in the excess of their affection, and from being two to become one, in which

case one or both would certainly perish. Whereas in a state having women and children common, love will be watery; and the father will certainly not say “my son,” or the son “my father.” As a little sweet wine mingled with a great deal of water is imperceptible in the mixture, so, in this sort of community, the idea of relationship which is based upon these names will be lost; there is no reason why the so-called father should care about the son, or the son about the father, or brothers about one another. Of the two qualities which chiefly inspire regard and affection—that a thing is your own and that it is your only one—neither can exist in such a state as this.

Again, the transfer of children as soon as they are born from the rank of husbandmen or of artisans to that of guardians, and from the rank of guardians into a lower rank, will be very difficult to arrange; the givers or transferrers cannot but know whom they are giving and transferring, and to whom. And the previously mentioned evils, such as assaults, unlawful loves, homicides, will happen more often amongst those who are transferred to the lower classes, or who have a place assigned to them among the guardians; for they will no longer call the members of the class they have left brothers, and children, and fathers, and mothers, and will not, therefore, be afraid of committing any crimes by reason of consanguinity. Touching the community of wives and children, let this be our conclusion.

Part V

Next let us consider what should be our arrangements about property: should the citizens of the perfect state have their possessions in common or not? This question may be discussed separately from the enactments about women and children. Even supposing that the women and children belong to individuals, according to the custom which is at present universal, may there not be an advantage in having and using possessions in common? Three cases are possible: (1) the soil may be appropriated, but the produce may be thrown for consumption into the common stock; and this is the practice of some nations. Or (2), the soil may be common, and may be cultivated in common, but the produce divided among individuals for their private use; this is a form of common property which is said to exist among certain barbarians. Or (3), the soil and the produce may be alike common.

When the husbandmen are not the owners, the case will be different and easier to deal with; but when they till the ground for themselves the question of ownership will give a world of trouble. If they do not share equally enjoyments and toils, those who labor much and get little will necessarily complain of those who labor little and receive or consume much. But indeed there is always a difficulty in men living together and having all human relations in common, but especially in their having common property. The partnerships of fellow-travelers are an example to the point; for they generally fall out over everyday matters and quarrel about any trifle which turns up. So with servants: we are most able to take offense at those with whom we most frequently come into contact in daily life.

These are only some of the disadvantages which attend the community of property; the present arrangement, if improved as it

might be by good customs and laws, would be far better, and would have the advantages of both systems. Property should be in a certain sense common, but, as a general rule, private; for, when everyone has a distinct interest, men will not complain of one another, and they will make more progress, because everyone will be attending to his own business. And yet by reason of goodness, and in respect of use, "Friends," as the proverb says, "will have all things common." Even now there are traces of such a principle, showing that it is not impracticable, but, in well-ordered states, exists already to a certain extent and may be carried further. For, although every man has his own property, some things he will place at the disposal of his friends, while of others he shares the use with them. The Lacedaemonians, for example, use one another's slaves, and horses, and dogs, as if they were their own; and when they lack provisions on a journey, they appropriate what they find in the fields throughout the country. It is clearly better that property should be private, but the use of it common; and the special business of the legislator is to create in men this benevolent disposition. Again, how immeasurably greater is the pleasure, when a man feels a thing to be his own; for surely the love of self is a feeling implanted by nature and not given in vain, although selfishness is rightly censured; this, however, is not the mere love of self, but the love of self in excess, like the miser's love of money; for all, or almost all, men love money and other such objects in a measure. And further, there is the greatest pleasure in doing a kindness or service to friends or guests or companions, which can only be rendered when a man has private property. These advantages are lost by excessive unification of the state. The exhibition of two virtues, besides, is visibly annihilated in such a state: first, temperance towards women (for it is an honorable action to abstain from another's wife for temperance sake); secondly, liberality in the matter of property. No one, when men have all things in common, will any longer set an example of liberality or do any liberal action; for liberality consists in the use which is made of property.

Such legislation may have a specious appearance of benevolence; men readily listen to it, and are easily induced to believe that in some wonderful manner everybody will become everybody's friend, especially when someone is heard denouncing the evils now existing in states, suits about contracts, convictions for perjury, flatteries of rich men and the like, which are said to arise out of the possession of private property. These evils, however, are due to a very different cause—the wickedness of human nature. Indeed, we see that there is much more quarrelling among those who have all things in common, though there are not many of them when compared with the vast numbers who have private property.

Again, we ought to reckon, not only the evils from which the citizens will be saved, but also the advantages which they will lose. The life which they are to lead appears to be quite impracticable. The error of Socrates must be attributed to the false notion of unity from which he starts. Unity there should be, both of the family and of the state, but in some respects only. For there is a point at which a state may attain such a degree of unity as to be no longer a state, or at which, without actually ceasing to exist, it will become an inferior state, like harmony passing into unison, or rhythm which has been reduced to a single foot. The state, as I was saying, is a plurality which should be united and made into a community by education; and it is strange that the author of a system of education which he thinks will make the state virtuous, should expect to improve his citizens by regulations of this sort, and not by philosophy or by customs and laws, like those which prevail at Sparta and Crete respecting common meals, whereby the legislator has made property common. Let us remember that we should not disregard the experience of ages; in the multitude of years these things, if they were good, would certainly not have been unknown; for almost everything has been found out, although sometimes they are not put together; in other cases men do not use the knowledge which they have. Great light would be thrown

on this subject if we could see such a form of government in the actual process of construction; for the legislator could not form a state at all without distributing and dividing its constituents into associations for common meals, and into phratries and tribes. But all this legislation ends only in forbidding agriculture to the guardians, a prohibition which the Lacedaemonians try to enforce already.

But, indeed, Socrates has not said, nor is it easy to decide, what in such a community will be the general form of the state. The citizens who are not guardians are the majority, and about them nothing has been determined: are the husbandmen, too, to have their property in common? Or is each individual to have his own? And are the wives and children to be individual or common. If, like the guardians, they are to have all things in common, what do they differ from them, or what will they gain by submitting to their government? Or, upon what principle would they submit, unless indeed the governing class adopt the ingenious policy of the Cretans, who give their slaves the same institutions as their own, but forbid them gymnastic exercises and the possession of arms. If, on the other hand, the inferior classes are to be like other cities in respect of marriage and property, what will be the form of the community? Must it not contain two states in one, each hostile to the other? He makes the guardians into a mere occupying garrison, while the husbandmen and artisans and the rest are the real citizens. But if so the suits and quarrels, and all the evils which Socrates affirms to exist in other states, will exist equally among them. He says indeed that, having so good an education, the citizens will not need many laws, for example laws about the city or about the markets; but then he confines his education to the guardians. Again, he makes the husbandmen owners of the property upon condition of their paying a tribute. But in that case they are likely to be much more unmanageable and conceited than the Helots, or Penestae, or slaves in general. And whether community of wives and property be necessary for the lower equally with the higher class or not, and the questions

akin to this, what will be the education, form of government, laws of the lower class, Socrates has nowhere determined: neither is it easy to discover this, nor is their character of small importance if the common life of the guardians is to be maintained.

Again, if Socrates makes the women common, and retains private property, the men will see to the fields, but who will see to the house? And who will do so if the agricultural class have both their property and their wives in common? Once more: it is absurd to argue, from the analogy of the animals, that men and women should follow the same pursuits, for animals have not to manage a household. The government, too, as constituted by Socrates, contains elements of danger; for he makes the same persons always rule. And if this is often a cause of disturbance among the meaner sort, how much more among high-spirited warriors? But that the persons whom he makes rulers must be the same is evident; for the gold which the God mingles in the souls of men is not at one time given to one, at another time to another, but always to the same: as he says, "God mingles gold in some, and silver in others, from their very birth; but brass and iron in those who are meant to be artisans and husbandmen." Again, he deprives the guardians even of happiness, and says that the legislator ought to make the whole state happy. But the whole cannot be happy unless most, or all, or some of its parts enjoy happiness. In this respect happiness is not like the even principle in numbers, which may exist only in the whole, but in neither of the parts; not so happiness. And if the guardians are not happy, who are? Surely not the artisans, or the common people. The Republic of which Socrates discourses has all these difficulties, and others quite as great.

克里特岛位于地中海北部，是希腊的第一大岛，它是诸多希腊神话的源地，过去是希腊文化、西洋文明的摇篮，现在则是美景难以形容的度假地。

Part VI

The same, or nearly the same, objections apply to Plato's later work, the *Laws*, and therefore we had better examine briefly the constitution which is therein described. In the *Republic*, Socrates has definitely settled in all a few questions only; such as the community of women and children, the community of property, and the constitution of the state. The population is divided into two classes—one of husbandmen, and the other of warriors; from this latter is taken a third class of counselors and rulers of the state. But Socrates has not determined whether the husbandmen and artisans are to have a share in the government, and whether they, too, are to carry arms and share in military service, or not. He certainly thinks that the women ought to share in the education of the guardians, and to fight by their side. The remainder of the work is filled up with digressions foreign to the main subject, and with discussions about the education of the guardians. In the *Laws* there is hardly anything but laws; not much is said about the constitution. This, which he had intended to make more of the ordinary type, he gradually brings round to the other or ideal form. For with the exception of the community of women and property, he supposes everything to be the same in both states; there is to be the same education; the citizens of both are to live free from servile occupations, and there are to be common meals in both. The only difference is that in the *Laws*, the common meals are extended to women, and the warriors number 5,000, but in the *Republic* only 1,000.

The discourses of Socrates are never commonplace; they always exhibit grace and originality and thought; but perfection in everything can hardly be expected. We must not overlook the fact that the number of 5,000 citizens, just now mentioned, will require a territory as large as Babylon, or some other huge site, if so many persons are to

be supported in idleness, together with their women and attendants, who will be a multitude many times as great. In framing an ideal we may assume what we wish, but should avoid impossibilities.

It is said that the legislator ought to have his eye directed to two points—the people and the country. But neighboring countries also must not be forgotten by him, firstly because the state for which he legislates is to have a political and not an isolated life. For a state must have such a military force as will be serviceable against her neighbors, and not merely useful at home. Even if the life of action is not admitted to be the best, either for individuals or states, still a city should be formidable to enemies, whether invading or retreating.

There is another point: Should not the amount of property be defined in some way which differs from this by being clearer? For Socrates says that a man should have so much property as will enable him to live temperately, which is only a way of saying “to live well”; this is too general a conception. Further, a man may live temperately and yet miserably. A better definition would be that a man must have so much property as will enable him to live not only temperately but liberally; if the two are parted, liberally will combine with luxury; temperance will be associated with toil. For liberality and temperance are the only eligible qualities which have to do with the use of property. A man cannot use property with mildness or courage, but temperately and liberally he may; and therefore the practice of these virtues is inseparable from property. There is an inconsistency, too, in equalizing the property and not regulating the number of the citizens; the population is to remain unlimited, and he thinks that it will be sufficiently equalized by a certain number of marriages being unfruitful, however many are born to others, because he finds this to be the case in existing states. But greater care will be required than now; for among ourselves, whatever may be the number of citizens, the property is always distributed among them, and therefore no one

is in want; but, if the property were incapable of division as in the *Laws*, the supernumeraries, whether few or many, would get nothing. One would have thought that it was even more necessary to limit population than property; and that the limit should be fixed by calculating the chances of mortality in the children, and of sterility in married persons. The neglect of this subject, which in existing states is so common, is a never-failing cause of poverty among the citizens; and poverty is the parent of revolution and crime. Pheidon the Corinthian, who was one of the most ardent legislators, thought that the families and the number of citizens ought to remain the same, although originally all the lots may have been of different sizes: but in the *Laws* the opposite principle is maintained. What in our opinion is the right arrangement will have to be explained hereafter.

There is another omission in the *Laws*: Socrates does not tell us how the rulers differ from their subjects; he only says that they should be related as the warp and the woof, which are made out of different wools. He allows that a man's whole property may be increased five-fold, but why should not his land also increase to a certain extent? Again, will the good management of a household be promoted by his arrangement of homesteads? For he assigns to each individual two homesteads in separate places, and it is difficult to live in two houses.

The whole system of government tends to be neither democracy nor oligarchy, but something in a mean between them, which is usually called a polity, and is composed of the heavy-armed soldiers. Now, if he intended to frame a constitution which would suit the greatest number of states, he was very likely right, but not if he meant to say that this constitutional form came nearest to his first or ideal state; for many would prefer the Lacedaemonian, or, possibly, some other more aristocratic government. Some, indeed, say that the best constitution is a combination of all existing forms, and they praise the Lacedaemonian because it is made up of oligarchy, monarchy, and

democracy, the king forming the monarchy, and the council of elders the oligarchy while the democratic element is represented by the Ephors; for the Ephors are selected from the people. Others, however, declare the Ephoralty to be a tyranny, and find the element of democracy in the common meals and in the habits of daily life. In the *Laws* it is maintained that the best constitution is made up of democracy and tyranny, which are either not constitutions at all, or are the worst of all. But they are nearer the truth who combine many forms; for the constitution is better which is made up of more numerous elements. The constitution proposed in the *Laws* has no element of monarchy at all; it is nothing but oligarchy and democracy, leaning rather to oligarchy. This is seen in the mode of appointing magistrates; for although the appointment of them by lot from among those who have been already selected combines both elements, the way in which the rich are compelled by law to attend the assembly and vote for magistrates or discharge other political duties, while the rest may do as they like, and the endeavor to have the greater number of the magistrates appointed out of the richer classes and the highest officers selected from those who have the greatest incomes, both these are oligarchical features. The oligarchical principle prevails also in the choice of the council, for all are compelled to choose, but the compulsion extends only to the choice out of the first class, and of an equal number out of the second class and out of the third class, but not in this latter case to all the voters but to those of the first three classes; and the selection of candidates out of the fourth class is only compulsory on the first and second. Then, from the persons so chosen, he says that there ought to be an equal number of each class selected. Thus a preponderance will be given to the better sort of people, who have the larger incomes, because many of the lower classes, not being compelled will not vote. These considerations, and others which will be adduced when the time comes for examining similar polities, tend to show that states like Plato's should not be composed of democracy and monarchy. There is also a danger in electing the magistrates out

of a body who are themselves elected; for, if but a small number choose to combine, the elections will always go as they desire. Such is the constitution which is described in the *Laws*.

Part VII

Other constitutions have been proposed; some by private persons, others by philosophers and statesmen, which all come nearer to established or existing ones than either of Plato's. No one else has introduced such novelties as the community of women and children, or public tables for women: other legislators begin with what is necessary. In the opinion of some, the regulation of property is the chief point of all, that being the question upon which all revolutions turn. This danger was recognized by Phaleas of Chalcedon^[3], who was the first to affirm that the citizens of a state ought to have equal possessions. He thought that in a new colony the equalization might be accomplished without difficulty, not so easily when a state was already established; and that then the shortest way of compassing the desired end would be for the rich to give and not to receive marriage portions, and for the poor not to give but to receive them.

Plato in the *Laws* was of opinion that, to a certain extent, accumulation should be allowed, forbidding, as I have already observed, any citizen to possess more than five times the minimum qualification. But those who make such laws should remember what they are apt to forget—that the legislator who fixes the amount of property should also fix the number of children; for, if the children are too many for the property, the law must be broken. And, besides the violation of the law, it is a bad thing that many from being rich should become poor; for men of ruined fortunes are sure to stir up revolutions. That the equalization of property exercises an influence on political society was clearly understood even by some of the old legislators. Laws were made by Solon and others prohibiting an individual from possessing as much land as he pleased; and there are other laws in states which forbid the sale of property: among the Locrians, for example, there is a law that a man is not to sell his

property unless he can prove unmistakably that some misfortune has befallen him. Again, there have been laws which enjoin the preservation of the original lots. Such a law existed in the island of Leucas, and the abrogation of it made the constitution too democratic, for the rulers no longer had the prescribed qualification. Again, where there is equality of property, the amount may be either too large or too small, and the possessor may be living either in luxury or penury. Clearly, then, the legislator ought not only to aim at the equalization of properties, but at moderation in their amount. Further, if he prescribe this moderate amount equally to all, he will be no nearer the mark; for it is not the possessions but the desires of mankind which require to be equalized, and this is impossible, unless a sufficient education is provided by the laws. But Phaleas will probably reply that this is precisely what he means; and that, in his opinion, there ought to be in states, not only equal property, but equal education. Still he should tell us what will be the character of his education; there is no use in having one and the same for all, if it is of a sort that predisposes men to avarice, or ambition, or both. Moreover, civil troubles arise, not only out of the inequality of property, but out of the inequality of honor, though in opposite ways. For the common people quarrel about the inequality of property, the higher class about the equality of honor; as the poet says,

“The bad and good alike in honor share.”

There are crimes of which the motive is want; and for these Phaleas expects to find a cure in the equalization of property, which will take away from a man the temptation to be a highwayman, because he is hungry or cold. But want is not the sole incentive to crime; men also wish to enjoy themselves and not to be in a state of desire—they wish to cure some desire, going beyond the necessities of life, which preys upon them; nay, this is not the only reason—they may desire superfluities in order to enjoy pleasures unaccompanied

with pain, and therefore they commit crimes.

Now what is the cure of these three disorders? Of the first, moderate possessions and occupation; of the second, habits of temperance; as to the third, if any desire pleasures which depend on themselves, they will find the satisfaction of their desires nowhere but in philosophy; for all other pleasures we are dependent on others. The fact is that the greatest crimes are caused by excess and not by necessity. Men do not become tyrants in order that they may not suffer cold; and hence great is the honor bestowed, not on him who kills a thief, but on him who kills a tyrant. Thus we see that the institutions of Phaleas avail only against petty crimes.

There is another objection to them. They are chiefly designed to promote the internal welfare of the state. But the legislator should consider also its relation to neighboring nations, and to all who are outside of it. The government must be organized with a view to military strength; and of this he has said not a word. And so with respect to property: there should not only be enough to supply the internal wants of the state, but also to meet dangers coming from without. The property of the state should not be so large that more powerful neighbors may be tempted by it, while the owners are unable to repel the invaders; nor yet so small that the state is unable to maintain a war even against states of equal power, and of the same character. Phaleas has not laid down any rule; but we should bear in mind that abundance of wealth is an advantage. The best limit will probably be, that a more powerful neighbor must have no inducement to go to war with you by reason of the excess of your wealth, but only such as he would have had if you had possessed less. There is a story that Eubulus, when Autophradates was going to besiege Atarneus, told him to consider how long the operation would take, and then reckon up the cost which would be incurred in the time.

“For,” said he, “I am willing for a smaller sum than that to leave

Atarneus at once." These words of Eubulus made an impression on Autophradates, and he desisted from the siege.

The equalization of property is one of the things that tend to prevent the citizens from quarrelling. Not that the gain in this direction is very great. For the nobles will be dissatisfied because they think themselves worthy of more than an equal share of honors; and this is often found to be a cause of sedition and revolution. And the avarice of mankind is insatiable; at one time two obols was pay enough; but now, when this sum has become customary, men always want more and more without end; for it is of the nature of desire not to be satisfied, and most men live only for the gratification of it. The beginning of reform is not so much to equalize property as to train the nobler sort of natures not to desire more, and to prevent the lower from getting more; that is to say, they must be kept down, but not ill-treated. Besides, the equalization proposed by Phaleas is imperfect; for he only equalizes land, whereas a man may be rich also in slaves, and cattle, and money, and in the abundance of what are called his movables. Now either all these things must be equalized, or some limit must be imposed on them, or they must an be let alone. It would appear that Phaleas is legislating for a small city only, if, as he supposes, all the artisans are to be public slaves and not to form a supplementary part of the body of citizens. But if there is a law that artisans are to be public slaves, it should only apply to those engaged on public works, as at Epidamnus, or at Athens on the plan which Diophantus once introduced.

From these observations any one may judge how far Phaleas was wrong or right in his ideas.

Part VIII

Hippodamus^[4], the son of Euryphon, a native of Miletus, the same who invented the art of planning cities, and who also laid out the Piraeus—a strange man, whose fondness for distinction led him into a general eccentricity of life, which made some think him affected (for he would wear flowing hair and expensive ornaments; but these were worn on a cheap but warm garment both in winter and summer); he, besides aspiring to be an adept in the knowledge of nature, was the first person not a statesman who made inquiries about the best form of government.

The city of Hippodamus was composed of 10,000 citizens divided into three parts—one of artisans, one of husbandmen, and a third of armed defenders of the state. He also divided the land into three parts, one sacred, one public, the third private: the first was set apart to maintain the customary worship of the Gods, the second was to support the warriors, the third was the property of the husbandmen. He also divided laws into three classes, and no more, for he maintained that there are three subjects of lawsuits—insult, injury, and homicide. He likewise instituted a single final court of appeal, to which all causes seeming to have been improperly decided might be referred; this court he formed of elders chosen for the purpose. He was further of opinion that the decisions of the courts ought not to be given by the use of a voting pebble, but that everyone should have a tablet on which he might not only write a simple condemnation, or leave the tablet blank for a simple acquittal; but, if he partly acquitted and partly condemned, he was to distinguish accordingly. To the existing law he objected that it obliged the judges to be guilty of perjury, whichever way they voted. He also enacted that those who discovered anything for the good of the state should be honored; and he provided that the children of citizens who died in battle should be

maintained at the public expense, as if such an enactment had never been heard of before, yet it actually exists at Athens and in other places. As to the magistrates, he would have them all elected by the people, that is, by the three classes already mentioned, and those who were elected were to watch over the interests of the public, of strangers, and of orphans. These are the most striking points in the constitution of Hippodamus. There is not much else.

The first of these proposals to which objection may be taken is the threefold division of the citizens. The artisans, and the husbandmen, and the warriors, all have a share in the government. But the husbandmen have no arms, and the artisans neither arms nor land, and therefore they become all but slaves of the warrior class. That they should share in all the offices is an impossibility; for generals and guardians of the citizens, and nearly all the principal magistrates, must be taken from the class of those who carry arms. Yet, if the two other classes have no share in the government, how can they be loyal citizens? It may be said that those who have arms must necessarily be masters of both the other classes, but this is not so easily accomplished unless they are numerous; and if they are, why should the other classes share in the government at all, or have power to appoint magistrates? Further, what use are farmers to the city? Artisans there must be, for these are wanted in every city, and they can live by their craft, as elsewhere; and the husbandmen too, if they really provided the warriors with food, might fairly have a share in the government. But in the republic of Hippodamus they are supposed to have land of their own, which they cultivate for their private benefit. Again, as to this common land out of which the soldiers are maintained, if they are themselves to be the cultivators of it, the warrior class will be identical with the husbandmen, although the legislator intended to make a distinction between them. If, again, there are to be other cultivators distinct both from the husbandmen, who have land of their own, and from the warriors, they will make a

fourth class, which has no place in the state and no share in anything. Or, if the same persons are to cultivate their own lands, and those of the public as well, they will have difficulty in supplying the quantity of produce which will maintain two households: and why, in this case, should there be any division, for they might find food themselves and give to the warriors from the same land and the same lots? There is surely a great confusion in all this.

Neither is the law to be commended which says that the judges, when a simple issue is laid before them, should distinguish in their judgement; for the judge is thus converted into an arbitrator. Now, in an arbitration, although the arbitrators are many, they confer with one another about the decision, and therefore they can distinguish; but in courts of law this is impossible, and, indeed, most legislators take pains to prevent the judges from holding any communication with one another. Again, will there not be confusion if the judge thinks that damages should be given, but not so much as the suitor demands? He asks, say, for twenty minae, and the judge allows him ten minae (or in general the suitor asks for more and the judge allows less), while another judge allows five, another four minae. In this way they will go on splitting up the damages, and some will grant the whole and others nothing: how is the final reckoning to be taken? Again, no one contends that he who votes for a simple acquittal or condemnation perjures himself, if the indictment has been laid in an unqualified form; and this is just, for the judge who acquits does not decide that the defendant owes nothing, but that he does not owe the twenty minae. He only is guilty of perjury who thinks that the defendant ought not to pay twenty minae, and yet condemns him.

To honor those who discover anything which is useful to the state is a proposal which has a specious sound, but cannot safely be enacted by law, for it may encourage informers, and perhaps even lead to political commotions. This question involves another. It has been

doubted whether it is or is not expedient to make any changes in the laws of a country, even if another law be better. Now, if an changes are inexpedient, we can hardly assent to the proposal of Hippodamus; for, under pretense of doing a public service, a man may introduce measures which are really destructive to the laws or to the constitution. But, since we have touched upon this subject, perhaps we had better go a little into detail, for, as I was saying, there is a difference of opinion, and it may sometimes seem desirable to make changes. Such changes in the other arts and sciences have certainly been beneficial; medicine, for example, and gymnastic, and every other art and craft have departed from traditional usage. And, if politics be an art, change must be necessary in this as in any other art. That improvement has occurred is shown by the fact that old customs are exceedingly simple and barbarous. For the ancient Hellenes went about armed and bought their brides of each other. The remains of ancient laws which have come down to us are quite absurd; for example, at Cumae there is a law about murder, to the effect that if the accuser produce a certain number of witnesses from among his own kinsmen, the accused shall be held guilty. Again, men in general desire the good, and not merely what their fathers had. But the primeval inhabitants, whether they were born of the earth or were the survivors of some destruction, may be supposed to have been no better than ordinary or even foolish people among ourselves (such is certainly the tradition concerning the earthborn men); and it would be ridiculous to rest contented with their notions. Even when laws have been written down, they ought not always to remain unaltered. As in other sciences, so in politics, it is impossible that all things should be precisely set down in writing; for enactments must be universal, but actions are concerned with particulars. Hence we infer that sometimes and in certain cases laws may be changed; but when we look at the matter from another point of view, great caution would seem to be required. For the habit of lightly changing the laws is an evil, and, when the advantage is small, some errors both of lawgivers and rulers

had better be left; the citizen will not gain so much by making the change as he will lose by the habit of disobedience. The analogy of the arts is false; a change in a law is a very different thing from a change in an art. For the law has no power to command obedience except that of habit, which can only be given by time, so that a readiness to change from old to new laws enfeebles the power of the law. Even if we admit that the laws are to be changed, are they all to be changed, and in every state? And are they to be changed by anybody who likes, or only by certain persons? These are very important questions; and therefore we had better reserve the discussion of them to a more suitable occasion.

Part IX

In the governments of Lacedaemon and Crete, and indeed in all governments, two points have to be considered: first, whether any particular law is good or bad, when compared with the perfect state; secondly, whether it is or is not consistent with the idea and character which the lawgiver has set before his citizens. That in a well-ordered state the citizens should have leisure^[5] and not have to provide for their daily wants is generally acknowledged, but there is a difficulty in seeing how this leisure is to be attained. The Thessalian Penestae have often risen against their masters, and the Helots in like manner against the Lacedaemonians, for whose misfortunes they are always lying in wait. Nothing, however, of this kind has as yet happened to the Cretans; the reason probably is that the neighboring cities, even when at war with one another, never form an alliance with rebellious serfs, rebellions not being for their interest, since they themselves have a dependent population. Whereas all the neighbors of the Lacedaemonians, whether Argives, Messenians, or Arcadians, were their enemies. In Thessaly, again, the original revolt of the slaves occurred because the Thessalians were still at war with the neighboring Achaeans, Perrhaebians, and Magnesians. Besides, if there were no other difficulty, the treatment or management of slaves is a troublesome affair; for, if not kept in hand, they are insolent, and think that they are as good as their masters, and, if harshly treated, they hate and conspire against them. Now it is clear that when these are the results the citizens of a state have not found out the secret of managing their subject population.

Again, the license of the Lacedaemonian women defeats the intention of the Spartan constitution, and is adverse to the happiness of the state. For, a husband and wife being each a part of every family, the state may be considered as about equally divided into men

and women; and, therefore, in those states in which the condition of the women is bad, half the city may be regarded as having no laws. And this is what has actually happened at Sparta; the legislator wanted to make the whole state hardy and temperate, and he has carried out his intention in the case of the men, but he has neglected the women, who live in every sort of intemperance and luxury. The consequence is that in such a state wealth is too highly valued, especially if the citizen fall under the dominion of their wives, after the manner of most warlike races, except the Celts and a few others who openly approve of male loves. The old mythologer would seem to have been right in uniting Ares and Aphrodite, for all warlike races are prone to the love either of men or of women. This was exemplified among the Spartans in the days of their greatness; many things were managed by their women. But what difference does it make whether women rule, or the rulers are ruled by women? The result is the same. Even in regard to courage, which is of no use in daily life, and is needed only in war, the influence of the Lacedaemonian women has been most mischievous. The evil showed itself in the Theban invasion, when, unlike the women other cities, they were utterly useless and caused more confusion than the enemy. This license of the Lacedaemonian women existed from the earliest times, and was only what might be expected. For, during the wars of the Lacedaemonians, first against the Argives, and afterwards against the Arcadians and Messenians, the men were long away from home, and, on the return of peace, they gave themselves into the legislator's hand, already prepared by the discipline of a soldier's life (in which there are many elements of virtue), to receive his enactments. But, when Lycurgus, as tradition says, wanted to bring the women under his laws, they resisted, and he gave up the attempt. These then are the causes of what then happened, and this defect in the constitution is clearly to be attributed to them. We are not, however, considering what is or is not to be excused, but what is right or wrong, and the disorder of the women, as I have already said, not only gives an air of indecorum to

the constitution considered in itself, but tends in a measure to foster avarice.

The mention of avarice naturally suggests a criticism on the inequality of property. While some of the Spartan citizen have quite small properties, others have very large ones; hence the land has passed into the hands of a few. And this is due also to faulty laws; for, although the legislator rightly holds up to shame the sale or purchase of an inheritance, he allows anybody who likes to give or bequeath it. Yet both practices lead to the same result. And nearly two-fifths of the whole country are held by women; this is owing to the number of heiresses and to the large dowries which are customary. It would surely have been better to have given no dowries at all, or, if any, but small or moderate ones. As the law now stands, a man may bestow his heiress on anyone whom he pleases, and, if he die intestate, the privilege of giving her away descends to his heir. Hence, although the country is able to maintain 1,500 cavalry and 30,000 hoplites, the whole number of Spartan citizens fell below 1,000. The result proves the faulty nature of their laws respecting property; for the city sank under a single defeat; the want of men was their ruin. There is a tradition that, in the days of their ancient kings, they were in the habit of giving the rights of citizenship to strangers, and therefore, in spite of their long wars, no lack of population was experienced by them; indeed, at one time Sparta is said to have numbered not less than 10,000 citizens. Whether this statement is true or not, it would certainly have been better to have maintained their numbers by the equalization of property. Again, the law which relates to the procreation of children is adverse to the correction of this inequality. For the legislator, wanting to have as many Spartans as he could, encouraged the citizens to have large families; and there is a law at Sparta that the father of three sons shall be exempt from military service, and he who has four from all the burdens of the state. Yet it is obvious that, if there were many children, the land being distributed

as it is, many of them must necessarily fall into poverty.

The Lacedaemonian constitution is defective in another point; I mean the Ephoralty. This magistracy has authority in the highest matters, but the Ephors are chosen from the whole people, and so the office is apt to fall into the hands of very poor men, who, being badly off, are open to bribes. There have been many examples at Sparta of this evil in former times; and quite recently, in the matter of the Andrians, certain of the Ephors who were bribed did their best to ruin the state. And so great and tyrannical is their power, that even the kings have been compelled to court them, so that, in this way as well together with the royal office, the whole constitution has deteriorated, and from being an aristocracy has turned into a democracy. The Ephoralty certainly does keep the state together; for the people are contented when they have a share in the highest office, and the result, whether due to the legislator or to chance, has been advantageous. For if a constitution is to be permanent, all the parts of the state must wish that it should exist and the same arrangements be maintained. This is the case at Sparta, where the kings desire its permanence because they have due honor in their own persons; the nobles because they are represented in the council of elders (for the office of elder is a reward of virtue); and the people, because all are eligible to the Ephoralty. The election of Ephors out of the whole people is perfectly right, but ought not to be carried on in the present fashion, which is too childish. Again, they have the decision of great causes, although they are quite ordinary men, and therefore they should not determine them merely on their own judgment, but according to written rules, and to the laws. Their way of life, too, is not in accordance with the spirit of the constitution—they have a deal too much license; whereas, in the case of the other citizens, the excess of strictness is so intolerable that they run away from the law into the secret indulgence of sensual pleasures.

Again, the council of elders is not free from defects. It may be said that the elders are good men and well trained in manly virtue; and that, therefore, there is an advantage to the state in having them. But that judges of important causes should hold office for life is a disputable thing, for the mind grows old as well as the body. And when men have been educated in such a manner that even the legislator himself cannot trust them, there is real danger. Many of the elders are well known to have taken bribes and to have been guilty of partiality in public affairs. And therefore they ought not to be irresponsible; yet at Sparta they are so. But (it may be replied), "All magistracies are accountable to the Ephors." Yes, but this prerogative is too great for them, and we maintain that the control should be exercised in some other manner. Further, the mode in which the Spartans elect their elders is childish; and it is improper that the person to be elected should canvass for the office; the worthiest should be appointed, whether he chooses or not. And here the legislator clearly indicates the same intention which appears in other parts of his constitution; he would have his citizens ambitious, and he has reckoned upon this quality in the election of the elders; for no one would ask to be elected if he were not. Yet ambition and avarice, almost more than any other passions, are the motives of crime.

Whether kings are or are not an advantage to states, I will consider at another time; they should at any rate be chosen, not as they are now, but with regard to their personal life and conduct. The legislator himself obviously did not suppose that he could make them really good men; at least he shows a great distrust of their virtue. For this reason the Spartans used to join enemies with them in the same embassy, and the quarrels between the kings were held to be conservative of the state.

Neither did the first introducer of the common meals, called "phiditia," regulate them well. The entertainment ought to have been

provided at the public cost, as in Crete; but among the Lacedaemonians every one is expected to contribute, and some of them are too poor to afford the expense; thus the intention of the legislator is frustrated. The common meals were meant to be a popular institution, but the existing manner of regulating them is the reverse of popular. For the very poor can scarcely take part in them; and, according to ancient custom, those who cannot contribute are not allowed to retain their rights of citizenship.

柏拉图（约公元前427年—公元前347年），古希腊伟大的哲学家，也是全部西方哲学乃至整个西方文化史上最伟大的哲学家和思想家之一。

The law about the Spartan admirals has often been censured, and with justice; it is a source of dissension, for the kings are perpetual generals, and this office of admiral is but the setting up of another king.

The charge which Plato brings, in the *Laws*, against the intention of the legislator, is likewise justified; the whole constitution has regard to one part of virtue only—the virtue of the soldier, which gives victory in war. So long as they were at war, therefore, their power was preserved, but when they had attained empire they fell for of the arts of peace they knew nothing, and had never engaged in any employment higher than war. There is another error, equally great, into which they have fallen. Although they truly think that the goods for which men contend are to be acquired by virtue rather than by vice, they err in supposing that these goods are to be preferred to the virtue which gains them.

Once more: the revenues of the state are ill-managed; there is no money in the treasury, although they are obliged to carry on great wars, and they are unwilling to pay taxes. The greater part of the land being in the hands of the Spartans, they do not look closely into one another's contributions. The result which the legislator has produced is the reverse of beneficial; for he has made his city poor, and his citizens greedy.

Enough respecting the Spartan constitution, of which these are the principal defects.

Part X

The Cretan constitution nearly resembles the Spartan, and in some few points is quite as good; but for the most part less perfect in form. The older constitutions are generally less elaborate than the later, and the Lacedaemonian is said to be, and probably is, in a very great measure, a copy of the Cretan. According to tradition, Lycurgus, when he ceased to be the guardian of King Charillus, went abroad and spent most of his time in Crete. For the two countries are nearly connected; the Lycians are a colony of the Lacedaemonians, and the colonists, when they came to Crete, adopted the constitution which they found existing among the inhabitants. Even to this day the Perioeci, or subject population of Crete, are governed by the original laws which Minos is supposed to have enacted. The island seems to be intended by nature for dominion in Hellas, and to be well situated; it extends right across the sea, around which nearly all the Hellenes are settled; and while one end is not far from the Peloponnese, the other almost reaches to the region of Asia about Triopium and Rhodes. Hence Minos acquired the empire of the sea, subduing some of the islands and colonizing others; at last he invaded Sicily, where he died near Camicus.

The Cretan institutions resemble the Lacedaemonian. The Helots are the husbandmen of the one, the Perioeci of the other, and both Cretans and Lacedaemonians have common meals, which were anciently called by the Lacedaemonians not “phiditia” but “andria”; and the Cretans have the same word, the use of which proves that the common meals originally came from Crete. Further, the two constitutions are similar; for the office of the Ephors is the same as that of the Cretan Cosmi, the only difference being that whereas the Ephors are five, the Cosmi are ten in number. The elders, too, answer to the elders in Crete, who are termed by the Cretans the council. And

the kingly office once existed in Crete, but was abolished, and the Cosmi have now the duty of leading them in war. All classes share in the ecclesia, but it can only ratify the decrees of the elders and the Cosmi.

The common meals of Crete are certainly better managed than the Lacedaemonian; for in Lacedaemon everyone pays so much per head, or, if he fails, the law, as I have already explained, forbids him to exercise the rights of citizenship. But in Crete they are of a more popular character. There, of all the fruits of the earth and cattle raised on the public lands, and of the tribute which is paid by the Perioeci, one portion is assigned to the Gods and to the service of the state, and another to the common meals, so that men, women, and children are all supported out of a common stock. The legislator has many ingenious ways of securing moderation in eating, which he conceives to be a gain; he likewise encourages the separation of men from women, lest they should have too many children, and the companionship of men with one another—whether this is a good or bad thing I shall have an opportunity of considering at another time. But that the Cretan common meals are better ordered than the Lacedaemonian there can be no doubt.

On the other hand, the Cosmi are even a worse institution than the Ephors, of which they have all the evils without the good. Like the Ephors, they are any chance persons, but in Crete this is not counterbalanced by a corresponding political advantage. At Sparta every one is eligible, and the body of the people, having a share in the highest office, want the constitution to be permanent. But in Crete the Cosmi are elected out of certain families, and not out of the whole people, and the elders out of those who have been Cosmi.

The same criticism may be made about the Cretan, which has been already made about the Lacedaemonian elders. Their irresponsibility and life tenure is too great a privilege, and their

arbitrary power of acting upon their own judgment, and dispensing with written law, is dangerous. It is no proof of the goodness of the institution that the people are not discontented at being excluded from it. For there is no profit to be made out of the office as out of the Ephoralty, since, unlike the Ephors, the Cosmi, being in an island, are removed from temptation.

The remedy by which they correct the evil of this institution is an extraordinary one, suited rather to a close oligarchy than to a constitutional state. For the Cosmi are often expelled by a conspiracy of their own colleagues, or of private individuals; and they are allowed also to resign before their term of office has expired. Surely all matters of this kind are better regulated by law than by the will of man, which is a very unsafe rule. Worst of all is the suspension of the office of Cosmi, a device to which the nobles often have recourse when they will not submit to justice. This shows that the Cretan government, although possessing some of the characteristics of a constitutional state, is really a close oligarchy.

The nobles have a habit, too, of setting up a chief; they get together a party among the common people and their own friends and then quarrel and fight with one another. What is this but the temporary destruction of the state and dissolution of society? A city is in a dangerous condition when those who are willing are also able to attack her. But, as I have already said, the island of Crete is saved by her situation; distance has the same effect as the Lacedaemonian prohibition of strangers; and the Cretans have no foreign dominions. This is the reason why the Perioeci are contented in Crete, whereas the Helots are perpetually revolting. But when lately foreign invaders found their way into the island, the weakness of the Cretan constitution was revealed. Enough of the government of Crete.

Part XI

The Carthaginians are also considered to have an excellent form of government, which differs from that of any other state in several respects, though it is in some very like the Lacedaemonian. Indeed, all three states—the Lacedaemonian, the Cretan, and the Carthaginian—nearly resemble one another, and are very different from any others. Many of the Carthaginian institutions are excellent. The superiority of their constitution is proved by the fact that the common people remain loyal to the constitution the Carthaginians have never had any rebellion worth speaking of, and have never been under the rule of a tyrant.

Among the points in which the Carthaginian constitution resembles the Lacedaemonian are the following: The common tables of the clubs answer to the Spartan phiditia, and their magistracy of the 104 to the Ephors; but, whereas the Ephors are any chance persons, the magistrates of the Carthaginians are elected according to merit—this is an improvement. They have also their kings and their gerusia, or council of elders, who correspond to the kings and elders of Sparta. Their kings, unlike the Spartan, are not always of the same family, nor that an ordinary one, but if there is some distinguished family they are selected out of it and not appointed by seniority—this is far better. Such officers have great power, and therefore, if they are persons of little worth, do a great deal of harm, and they have already done harm at Lacedaemon.

Most of the defects or deviations from the perfect state, for which the Carthaginian constitution would be censured, apply equally to all the forms of government which we have mentioned. But of the deflections from aristocracy and constitutional government, some incline more to democracy and some to oligarchy. The kings and

elders, if unanimous, may determine whether they will or will not bring a matter before the people, but when they are not unanimous, the people decide on such matters as well. And whatever the kings and elders bring before the people is not only heard but also determined by them, and any one who likes may oppose it; now this is not permitted in Sparta and Crete. That the magistrates of five who have under them many important matters should be co-opted, that they should choose the supreme council of 100, and should hold office longer than other magistrates (for they are virtually rulers both before and after they hold office)—these are oligarchical features; their being without salary and not elected by lot, and any similar points, such as the practice of having all suits tried by the magistrates, and not some by one class of judges or jurors and some by another, as at Lacedaemon, are characteristic of aristocracy. The Carthaginian constitution deviates from aristocracy and inclines to oligarchy, chiefly on a point where popular opinion is on their side. For men in general think that magistrates should be chosen not only for their merit, but for their wealth: a man, they say, who is poor cannot rule well—he has not the leisure. If, then, election of magistrates for their wealth be characteristic of oligarchy, and election for merit of aristocracy, there will be a third form under which the constitution of Carthage is comprehended; for the Carthaginians choose their magistrates, and particularly the highest of them—their kings and generals—with an eye both to merit and to wealth.

But we must acknowledge that, in thus deviating from aristocracy, the legislator has committed an error. Nothing is more absolutely necessary than to provide that the highest class, not only when in office, but when out of office, should have leisure and not disgrace themselves in any way; and to this his attention should be first directed. Even if you must have regard to wealth, in order to secure leisure, yet it is surely a bad thing that the greatest offices, such as those of kings and generals, should be bought. The law which

allows this abuse makes wealth of more account than virtue, and the whole state becomes avaricious. For, whenever the chiefs of the state deem anything honorable, the other citizens are sure to follow their example; and, where virtue has not the first place, their aristocracy cannot be firmly established. Those who have been at the expense of purchasing their places will be in the habit of repaying themselves; and it is absurd to suppose that a poor and honest man will be wanting to make gains, and that a lower stamp of man who has incurred a great expense will not. Wherefore they should rule who are able to rule best. And even if the legislator does not care to protect the good from poverty, he should at any rate secure leisure for them when in office.

It would seem also to be a bad principle that the same person should hold many offices, which is a favorite practice among the Carthaginians, for one business is better done by one man. The legislator should see to this and should not appoint the same person to be a flute-player and a shoemaker. Hence, where the state is large, it is more in accordance both with constitutional and with democratic principles that the offices of state should be distributed among many persons. For, as I said, this arrangement is fairer to all, and any action familiarized by repetition is better and sooner performed. We have a proof in military and naval matters; the duties of command and of obedience in both these services extend to all.

The government of the Carthaginians is oligarchical, but they successfully escape the evils of oligarchy by enriching one portion of the people after another by sending them to their colonies. This is their panacea and the means by which they give stability to the state. Accident favors them, but the legislator should be able to provide against revolution without trusting to accidents. As things are, if any misfortune occurred, and the bulk of the subjects revolted, there would be no way of restoring peace by legal methods.

Such is the character of the Lacedaemonian, Cretan, and Carthaginian constitutions, which are justly celebrated.

Part XII

Of those who have treated of governments, some have never taken any part at all in public affairs, but have passed their lives in a private station; about most of them, what was worth telling has been already told. Others have been lawgivers, either in their own or in foreign cities, whose affairs they have administered; and of these some have only made laws, others have framed constitutions; for example, Lycurgus and Solon did both. Of the Lacedaemonian constitution I have already spoken. As to Solon, he is thought by some to have been a good legislator, who put an end to the exclusiveness of the oligarchy, emancipated the people, established the ancient Athenian democracy, and harmonized the different elements of the state. According to their view, the council of Areopagus was an oligarchical element, the elected magistracy, aristocratical, and the courts of law, democratical. The truth seems to be that the council and the elected magistracy existed before the time of Solon, and were retained by him, but that he formed the courts of law out of an the citizens, thus creating the democracy, which is the very reason why he is sometimes blamed. For in giving the supreme power to the law courts, which are elected by lot, he is thought to have destroyed the non-democratic element. When the law courts grew powerful, to please the people who were now playing the tyrant the old constitution was changed into the existing democracy. Ephialtes and Pericles curtailed the power of the Areopagus; Pericles also instituted the payment of the juries, and thus every demagogue in turn increased the power of the democracy until it became what we now see. All this is true; it seems, however, to be the result of circumstances, and not to have been intended by Solon. For the people, having been instrumental in gaining the empire of the sea in the Persian War, began to get a notion of itself, and followed worthless demagogues, whom the better class opposed. Solon, himself, appears to have given the Athenians only

that power of electing to offices and calling to account the magistrates which was absolutely necessary; for without it they would have been in a state of slavery and enmity to the government. All the magistrates he appointed from the notables and the men of wealth, that is to say, from the pentacosio-medimni, or from the class called zeugitae, or from a third class of so-called knights or cavalry. The fourth class were laborers who had no share in any magistracy.

Mere legislators were Zaleucus, who gave laws to the Epizephyrian Locrians, and Charondas, who legislated for his own city of Catana, and for the other Chalcidian cities in Italy and Sicily. Some people attempt to make out that Onomacritus was the first person who had any special skill in legislation, and that he, although a Locrian by birth, was trained in Crete, where he lived in the exercise of his prophetic art; that Thales was his companion, and that Lycurgus and Zaleucus were disciples of Thales, as Charondas was of Zaleucus. But their account is quite inconsistent with chronology.

There was also Philolaus, the Corinthian, who gave laws to the Thebans. This Philolaus was one of the family of the Bacchiadae, and a lover of Diocles, the Olympic victor, who left Corinth in horror of the incestuous passion which his mother Halcyone had conceived for him, and retired to Thebes, where the two friends together ended their days. The inhabitants still point out their tombs, which are in full view of one another, but one is visible from the Corinthian territory, the other not. Tradition says the two friends arranged them thus, Diocles out of horror at his misfortunes, so that the land of Corinth might not be visible from his tomb; Philolaus that it might. This is the reason why they settled at Thebes, and so Philolaus legislated for the Thebans, and, besides some other enactments, gave them laws about the procreation of children, which they call the "Laws of Adoption." These laws were peculiar to him, and were intended to preserve the number of the lots.

In the legislation of Charondas there is nothing remarkable, except the suits against false witnesses. He is the first who instituted denunciation for perjury. His laws are more exact and more precisely expressed than even those of our modern legislators.

(Characteristic of Phaleas is the equalization of property; of Plato, the community of women, children, and property, the common meals of women, and the law about drinking, that the sober shall be masters of the feast; also the training of soldiers to acquire by practice equal skill with both hands, so that one should be as useful as the other.)

Draco has left laws, but he adapted them to a constitution which already existed, and there is no peculiarity in them which is worth mentioning, except the greatness and severity of the punishments.

Pittacus, too, was only a lawgiver, and not the author of a constitution; he has a law which is peculiar to him, that, if a drunken man do something wrong, he shall be more heavily punished than if he were sober; he looked not to the excuse which might be offered for the drunkard, but only to expediency, for drunken more often than sober people commit acts of violence.

Androdamas of Rhegium gave laws to the Chalcidians of Thrace. Some of them relate to homicide, and to heiresses; but there is nothing remarkable in them.

And here let us conclude our inquiry into the various constitutions which either actually exist, or have been devised by theorists.

[1] 参见[美]戴维斯：《哲学的政治》，24—38页，北京，华夏出版社，2012。

[2] 英文为Republic，拉丁拼写的希腊文为Politeia，国内通常译为《理想国》，

此名称为意译，原意就是“政体”的意思。又因为希腊语中Politeia是一个双关语，既有“政体”的意思，也有“共和国”的意思。所以中文也可以译为《共和国》。现在也有一些国内学者根据此书内容又翻译为《王制》。

[3] Phaleas of Chalcedon：卡耳克东的费勒亚斯，卡耳克东为古希腊海运城市，在小亚细亚地区。费勒亚斯是古希腊的政治家，生活在大约公元前4世纪，唯一提到他的名字的古代文献就是亚里士多德的《政治学》。

[4] 希波达莫斯，公元前5世纪左右出生于米利都。根据亚里士多德介绍，他是城市规划学的发明者，同时还是建筑学家、医药学家、数学家、气象学家。亚里士多德特意描述了他的一些奇闻异事，而且强调他是第一个研究最佳政体问题的非政治家，带有嘲讽的意思，是想说明如希波达莫斯这样没有真正的政治学学者所要求的审慎、明智的实践理性，而是在设计政体上过于追求大胆创新，因而往往与城邦的传统、习俗冲突。他们不能理解政治的保守本性。把政治的技艺与其他技艺混淆。

[5] Leisure：闲暇，在亚里士多德乃至整个古希腊哲学家看来都是一种极为重要的价值。在柏拉图和亚里士多德看来，只有哲学家的沉思的生活才是最高贵的生活方式，而这种生活方式要求具有充足的闲暇，而不至于为生计而忙碌。从词源上来看，英文的学校school一词，就是从希腊文“闲暇”即skholee一词得来的。可见在古希腊人看来，学习、思辨的生活只有建立在充分的闲暇上才有可能。在亚里士多德的思想里，闲暇甚至是幸福、德性的来源，只有处于闲暇之中，人们才有充分的时间来培育各种美德。

BOOK THREE

导 读

在第三卷的前半部分，亚里士多德分析了城邦、政体、公民各自的概念以及相互之间的关系，在后半部分中则列举了各种不同的政体以及点评了其各自的优劣。

城邦是由参与政体的公民组成的，公民参与政体意味着他们担任着城邦中无定期的官职，也就是说，公民就是在城邦中有权进行自我统治的人。而谁有权进行统治的问题则决定了一个城邦属于何种政体。因而城邦、公民、政体这三者是紧密联系在一起的。

某种意义上，城邦的同一可以归结为政体的同一。而政体则基于公民对于“谁有权进行统治”这一问题的理解。政体其实就是城邦对于官职尤其是最高官职的安排。谁应当统治，谁应当被统治，实际上是一个平等的问题。不同的政体有着对于平等的不同的理解和标准。一个城邦也就是一群对平等有着共同理解的人、公民所组成的共同体。人是政治的动物实际上也就是指人是一种天生就愿意对平等问题进行思考、讨论的动物。又由于对于平等的理解可能有对有错、有好有坏，所以亚里士多德又提醒我们注意一个好公民并不见得等同于一个好人。因为公民的好坏要由其所在的政体决定，而政体本身也有可能是坏的。只有在最好的政体中，好公民才会等同于好人。^[1]

然后，亚里士多德对于政体的类型进行了划分。按照人数多少的标准以及是出于公共利益还是私人利益进行统治的标准，政体可划分为君主政体、贵族政体、共和政体、僭主政体、寡头政体、平民政体。前三者是正当的政体，这三种政体都是以追求公共利益为目的的。而后三种政体则分别是前三者各自的堕落形式，是一种出于私人利益的统治。君主政体和僭主政体都是一人的统治，贵族政体和寡头政体是少数人的统治，共和政体和平民政体则是多数人的统治。这里有两点值得注意。首先，寡头政体与平民政体划分的标准，实际上是富人统治还是穷人统治，只不过是因为大部分城邦中富人都只是少数，而穷人是大多数，所

以才显现得像是以统治人数的多少划分寡头政体和平民政体。因而在亚里士多德看来，富与贫，才是划分政体的最主要标准，而这里的富与贫实际上不仅可以理解为财产上的多少，也可以理解为任意一种资质上（如德性）的充足与缺乏。其次，共和政体（politeia）与政体（politeia）实际上是共用的一个单词。Politeia是一个双关语。共和政体某种意义上才是最典型的政体所是的样子。因为既然政体的本来就是取决于公民们对于平等的共同理解，那么不论是任何一种类型的政体，只要是包含了公民的认同，那么不管统治人数的多寡还是富贫，都可以称之为共和政体，也就是政体（politeia）。^[2]如果这种公民的共同理解可以被称作为一种政治之善的话，那么城邦的目的也自然就是追求这种政治之善。

接下来，亚里士多德自然而然地就开始讨论这种政治之善、平等的含义。平等意味着给予与自己平等地位的人以平等对待，给予与自己不平等地位的人以不平等对待。这样的一种状态也就是公平。但是，由于平等具有不同的标准以及人们总是在自己事务上的糟糕判断者，这两个因素决定了人们总是过高地估计自己的地位，人们都想根据对于自己有利的标准来决定什么是平等。比如说富人想以财富的多少来作为平等的标准，而穷人则想以出身自由来作为平等的标准。

这样一来，平等这个标准实际上就是模糊的。任何一种平等的具体标准都有其有道理之处，但也有不合理之处。以富与穷这个根本标准为例，各自都有其问题。穷人的统治，由于其贫穷而缺乏教育与闲暇，可能成为暴民的统治。而富人的统治关键的问题是这种“富”的标准只是一种数量上相对的，少数的富裕者在总量上可能比不上大多数贫穷者的总和。不论是财产、德性还是荣誉上都是如此。事实上，这种富与贫的政体划分的根本标准，是建立在一种对于平等地位、政治资格的斤斤计较、计算之上的，而这种计算会毁灭任何一个政体的稳定性。因为城邦中的任何一拨人都可以组合起来成为一个集团，形成一种相对于其他人的“富”，从而要求本集团的统治权力。而这样的集团可以有数十上百个。

如此看来，最好的政体就是由一个各种资质上都远超于其余人总和的几乎是半神的人的君主统治。他不需要和任何人组成集团来形成相对

优势，其余的人无论组成如何的集团也威胁不到他的地位。但是这种近乎于神的人的统治，似乎只存在于想象中。政治如果被定义为自由人之间的统治的话，那么这种人的出现实际上就是破坏了政治的根本基础。于是人们为了城邦集体的利益会流放这种人，亚里士多德在某种程度上甚至是支持这种做法的。

最后，亚里士多德分析起了君主制。他认为君主制相对于法治来说有其不可克服的缺陷，君主无法像法律那样摆脱激情对自己的统治。法律最重要的意义是它是一种远离激情的理性，它尤其可以克服那种政治上的激情。城邦源自于人们对于公正的探索，但是这种探索也应该受到节制，不可被激情引向极端，不然的话城邦总是会被不断的冲突与内乱所困扰。

Part I

He who would inquire into the essence and attributes of various kinds of governments must first of all determine "What is a state?" At present this is a disputed question. Some say that the state has done a certain act; others, no, not the state, but the oligarchy or the tyrant. And the legislator or statesman is concerned entirely with the state; a constitution or government being an arrangement of the inhabitants of a state.

But a state is composite, like any other whole made up of many parts; these are the citizens, who compose it. It is evident, therefore, that we must begin by asking, Who is the citizen, and what is the meaning of the term? For here again there may be a difference of opinion. He who is a citizen in a democracy will often not be a citizen in an oligarchy. Leaving out of consideration those who have been made citizens, or who have obtained the name of citizen any other accidental manner, we may say, first, that a citizen is not a citizen because he lives in a certain place, for resident aliens and slaves share in the place; nor is he a citizen who has no legal right except that of suing and being sued; for this right may be enjoyed under the provisions of a treaty. Nay, resident aliens in many places do not possess even such rights completely, for they are obliged to have a patron, so that they do but imperfectly participate in citizenship, and we call them citizens only in a qualified sense, as we might apply the term to children who are too young to be on the register, or to old men who have been relieved from state duties. Of these we do not say quite simply that they are citizens, but add in the one case that they are not of age, and in the other, that they are past the age, or something of that sort; the precise expression is immaterial, for our meaning is clear. Similar difficulties to those which I have mentioned may be raised and answered about deprived citizens and about exiles.

But the citizen whom we are seeking to define is a citizen in the strictest sense, against whom no such exception can be taken, and his special characteristic is that he shares in the administration of justice, and in offices. Now of offices some are discontinuous, and the same persons are not allowed to hold them twice, or can only hold them after a fixed interval; others have no limit of time—for example, the office of a dicast or ecclesiast. It may, indeed, be argued that these are not magistrates at all, and that their functions give them no share in the government. But surely it is ridiculous to say that those who have the power do not govern. Let us not dwell further upon this, which is a purely verbal question; what we want is a common term including both dicast and ecclesiast. Let us, for the sake of distinction, call it “indefinite office,” and we will assume that those who share in such office are citizens. This is the most comprehensive definition of a citizen, and best suits all those who are generally so called.

But we must not forget that things of which the underlying principles differ in kind, one of them being first, another second, another third, have, when regarded in this relation, nothing, or hardly anything, worth mentioning in common. Now we see that governments differ in kind, and that some of them are prior and that others are posterior; those which are faulty or perverted are necessarily posterior to those which are perfect. (What we mean by perversion will be hereafter explained.) The citizen then of necessity differs under each form of government; and our definition is best adapted to the citizen of a democracy; but not necessarily to other states. For in some states the people are not acknowledged, nor have they any regular assembly, but only extraordinary ones; and suits are distributed by sections among the magistrates. At Lacedaemon, for instance, the Ephors determine suits about contracts, which they distribute among themselves, while the elders are judges of homicide, and other causes are decided by other magistrates. A similar principle prevails at Carthage; there certain magistrates decide all causes. We

may, indeed, modify our definition of the citizen so as to include these states. In them it is the holder of a definite, not of an indefinite office, who legislates and judges, and to some or all such holders of definite offices is reserved the right of deliberating or judging about some things or about all things. The conception of the citizen now begins to clear up.

He who has the power to take part in the deliberative or judicial administration of any state is said by us to be a citizens of that state; and, speaking generally, a state is a body of citizens sufficing for the purposes of life.

Part II

But in practice a citizen is defined to be one of whom both the parents are citizens; others insist on going further back; say to two or three or more ancestors. This is a short and practical definition but there are some who raise the further question: How this third or fourth ancestor came to be a citizen? Gorgias of Leontini, partly because he was in a difficulty, partly in irony, said—"Mortars are what is made by the mortar-makers, and the citizens of Larissa are those who are made by the magistrates; for it is their trade to make Larissaeans." Yet the question is really simple, for, if according to the definition just given they shared in the government, they were citizens. This is a better definition than the other. For the words, "born of a father or mother who is a citizen," cannot possibly apply to the first inhabitants or founders of a state.

There is a greater difficulty in the case of those who have been made citizens after a revolution, as by Cleisthenes at Athens after the expulsion of the tyrants, for he enrolled in tribes many metics, both strangers and slaves. The doubt in these cases is, not who is, but whether he who is ought to be a citizen; and there will still be a further doubt, whether he who ought not to be a citizen, is one in fact, for what ought not to be is what is false. Now, there are some who hold office, and yet ought not to hold office, whom we describe as ruling, but ruling unjustly. And the citizen was defined by the fact of his holding some kind of rule or office—he who holds a judicial or legislative office fulfills our definition of a citizen. It is evident, therefore, that the citizens about whom the doubt has arisen must be called citizens.

Part III

Whether they ought to be so or not is a question which is bound up with the previous inquiry. For a parallel question is raised respecting the state, whether a certain act is or is not an act of the state; for example, in the transition from an oligarchy or a tyranny to a democracy. In such cases persons refuse to fulfill their contracts or any other obligations, on the ground that the tyrant, and not the state, contracted them; they argue that some constitutions are established by force, and not for the sake of the common good. But this would apply equally to democracies, for they too may be founded on violence, and then the acts of the democracy will be neither more nor less acts of the state in question than those of an oligarchy or of a tyranny. This question runs up into another: on what principle shall we ever say that the state is the same, or different? It would be a very superficial view which considered only the place and the inhabitants (for the soil and the population may be separated, and some of the inhabitants may live in one place and some in another). This, however, is not a very serious difficulty; we need only remark that the word “state” is ambiguous.

It is further asked: When are men, living in the same place, to be regarded as a single city—what is the limit? Certainly not the wall of the city, for you might surround all Peloponnesus with a wall. Like this, we may say, is Babylon, and every city that has the compass of a nation rather than a city; Babylon, they say, had been taken for three days before some part of the inhabitants became aware of the fact. This difficulty may, however, with advantage be deferred to another occasion; the statesman has to consider the size of the state, and whether it should consist of more than one nation or not.

Again, shall we say that while the race of inhabitants, as well as

their place of abode, remain the same, the city is also the same, although the citizens are always dying and being born, as we call rivers and fountains the same, although the water is always flowing away and coming again? Or shall we say that the generations of men, like the rivers, are the same, but that the state changes? For, since the state is a partnership, and is a partnership of citizens in a constitution, when the form of government changes, and becomes different, then it may be supposed that the state is no longer the same, just as a tragic differs from a comic chorus, although the members of both may be identical. And in this manner we speak of every union or composition of elements as different when the form of their composition alters; for example, a scale containing the same sounds is said to be different, accordingly as the Dorian or the Phrygian mode is employed. And if this is true it is evident that the sameness of the state consists chiefly in the sameness of the constitution, and it may be called or not called by the same name, whether the inhabitants are the same or entirely different. It is quite another question, whether a state ought or ought not to fulfill engagements when the form of government changes.

Part IV

There is a point nearly allied to the preceding: Whether the virtue of a good man and a good citizen is the same or not. But, before entering on this discussion, we must certainly first obtain some general notion of the virtue of the citizen. Like the sailor, the citizen is a member of a community. Now, sailors have different functions, for one of them is a rower, another a pilot, and a third a lookout man, a fourth is described by some similar term; and while the precise definition of each individual's virtue applies exclusively to him, there is, at the same time, a common definition applicable to them all. For they have all of them a common object, which is safety in navigation. Similarly, one citizen differs from another, but the salvation of the community is the common business of them all. This community is the constitution; the virtue of the citizen must therefore be relative to the constitution of which he is a member. If, then, there are many forms of government, it is evident that there is not one single virtue of the good citizen which is perfect virtue. But we say that the good man is he who has one single virtue which is perfect virtue. Hence it is evident that the good citizen need not of necessity possess the virtue which makes a good man.

The same question may also be approached by another road, from a consideration of the best constitution. If the state cannot be entirely composed of good men, and yet each citizen is expected to do his own business well, and must therefore have virtue, still inasmuch as all the citizens cannot be alike, the virtue of the citizen and of the good man cannot coincide. All must have the virtue of the good citizen—thus, and thus only, can the state be perfect; but they will not have the virtue of a good man, unless we assume that in the good state all the citizens must be good.

古城迦太基（该词源于腓尼基语，意为“新的城市”）坐落于非洲北海岸（今突尼斯），与罗马隔海相望。它濒临地中海，是奴隶制国家迦太基的首都。最后因为在三次布匿战争（Punic Wars）中均被罗马打败而灭亡。

Again, the state, as composed of unlikes, may be compared to the living being: as the first elements into which a living being is resolved are soul and body, as soul is made up of rational principle and appetite, the family of husband and wife, property of master and slave, so of all these, as well as other dissimilar elements, the state is composed; and, therefore, the virtue of all the citizens cannot possibly be the same, any more than the excellence of the leader of a chorus is the same as that of the performer who stands by his side. I have said enough to show why the two kinds of virtue cannot be absolutely and always the same.

But will there then be no case in which the virtue of the good citizen and the virtue of the good man coincide? To this we answer that the good ruler is a good and wise man, and that he who would be a statesman must be a wise man. And some persons say that even the education of the ruler should be of a special kind; for are not the children of kings instructed in riding and military exercises? As Euripides says:

“No subtle arts for me, but what the state requires.”

As though there were a special education needed by a ruler. If then the virtue of a good ruler is the same as that of a good man, and we assume further that the subject is a citizen as well as the ruler, the virtue of the good citizen and the virtue of the good man cannot be absolutely the same, although in some cases they may; for the virtue of a ruler differs from that of a citizen. It was the sense of this difference which made Jason say that “he felt hungry when he was not a tyrant,” meaning that he could not endure to live in a private station. But, on the other hand, it may be argued that men are praised for knowing both how to rule and how to obey, and he is said to be a citizen of approved virtue who is able to do both. Now if we suppose the virtue of a good man to be that which rules, and the virtue of the

citizen to include ruling and obeying, it cannot be said that they are equally worthy of praise. Since, then, it is sometimes thought that the ruler and the ruled must learn different things and not the same, but that the citizen must know and share in them both, the inference is obvious. There is, indeed, the rule of a master, which is concerned with menial offices—the master need not know how to perform these, but may employ others in the execution of them: the other would be degrading; and by the other I mean the power actually to do menial duties, which vary much in character and are executed by various classes of slaves, such, for example, as handicraftsmen, who, as their name signifies, live by the labor of their hands: under these the mechanic is included. Hence in ancient times, and among some nations, the working classes had no share in the government—a privilege which they only acquired under the extreme democracy. Certainly the good man and the statesman and the good citizen ought not to learn the crafts of inferiors except for their own occasional use; if they habitually practice them, there will cease to be a distinction between master and slave.

This is not the rule of which we are speaking; but there is a rule of another kind, which is exercised over freemen and equals by birth—a constitutional rule, which the ruler must learn by obeying, as he would learn the duties of a general of cavalry by being under the orders of a general of cavalry, or the duties of a general of infantry by being under the orders of a general of infantry, and by having had the command of a regiment and of a company. It has been well said that “he who has never learned to obey cannot be a good commander.” The two are not the same, but the good citizen ought to be capable of both; he should know how to govern like a freeman, and how to obey like a freeman—these are the virtues of a citizen. And, although the temperance and justice of a ruler are distinct from those of a subject, the virtue of a good man will include both; for the virtue of the good man who is free and also a subject, e.g., his justice, will not be one but

will comprise distinct kinds, the one qualifying him to rule, the other to obey, and differing as the temperance and courage of men and women differ. For a man would be thought a coward if he had no more courage than a courageous woman, and a woman would be thought loquacious if she imposed no more restraint on her conversation than the good man; and indeed their part in the management of the household is different, for the duty of the one is to acquire, and of the other to preserve. Practical wisdom only is characteristic of the ruler: it would seem that all other virtues must equally belong to ruler and subject. The virtue of the subject is certainly not wisdom, but only true opinion; he may be compared to the maker of the flute, while his master is like the flute-player or user of the flute.

From these considerations may be gathered the answer to the question, whether the virtue of the good man is the same as that of the good citizen, or different, and how far the same, and how far different.

Part V

There still remains one more question about the citizen: Is he only a true citizen who has a share of office, or is the mechanic to be included? If they who hold no office are to be deemed citizens, not every citizen can have this virtue of ruling and obeying; for this man is a citizen. And if none of the lower class are citizens, in which part of the state are they to be placed? For they are not resident aliens, and they are not foreigners. May we not reply, that as far as this objection goes there is no more absurdity in excluding them than in excluding slaves and freedmen from any of the above-mentioned classes? It must be admitted that we cannot consider all those to be citizens who are necessary to the existence of the state; for example, children are not citizen equally with grown-up men, who are citizens absolutely, but children, not being grown up, are only citizens on a certain assumption. Nay, in ancient times, and among some nations the artisan class were slaves or foreigners, and therefore the majority of them are so now. The best form of state will not admit them to citizenship; but if they are admitted, then our definition of the virtue of a citizen will not apply to every citizen nor to every free man as such, but only to those who are freed from necessary services. The necessary people are either slaves who minister to the wants of individuals, or mechanics and laborers who are the servants of the community. These reflections carried a little further will explain their position; and indeed what has been said already is of itself, when understood, explanation enough.

Since there are many forms of government there must be many varieties of citizen and especially of citizens who are subjects; so that under some governments the mechanic and the laborer will be citizens, but not in others, as, for example, in aristocracy or the so-called government of the best (if there be such an one), in which

honors are given according to virtue and merit; for no man can practice virtue who is living the life of a mechanic or laborer. In oligarchies the qualification for office is high, and therefore no laborer can ever be a citizen; but a mechanic may, for an actual majority of them are rich. At Thebes there was a law that no man could hold office who had not retired from business for ten years. But in many states the law goes to the length of admitting aliens; for in some democracies a man is a citizen though his mother only be a citizen; and a similar principle is applied to illegitimate children; the law is relaxed when there is a dearth of population. But when the number of citizens increases, first the children of a male or a female slave are excluded; then those whose mothers only are citizens; and at last the right of citizenship is confined to those whose fathers and mothers are both citizens.

Hence, as is evident, there are different kinds of citizens; and he is a citizen in the highest sense who shares in the honors of the state. Compare Homer's words, "like some dishonored stranger"; he who is excluded from the honors of the state is no better than an alien. But when his exclusion is concealed, then the object is that the privileged class may deceive their fellow inhabitants.

As to the question whether the virtue of the good man is the same as that of the good citizen, the considerations already adduced prove that in some states the good man and the good citizen are the same, and in others different. When they are the same it is not every citizen who is a good man, but only the statesman and those who have or may have, alone or in conjunction with others, the conduct of public affairs.

Part VI

Having determined these questions, we have next to consider whether there is only one form of government or many, and if many, what they are, and how many, and what are the differences between them.

A constitution is the arrangement of magistracies in a state, especially of the highest of all. The government is everywhere sovereign in the state, and the constitution is in fact the government. For example, in democracies the people are supreme, but in oligarchies, the few; and, therefore, we say that these two forms of government also are different: and so in other cases.

First, let us consider what is the purpose of a state, and how many forms of government there are by which human society is regulated. We have already said, in the first part of this treatise, when discussing household management and the rule of a master, that man is by nature a political animal. And therefore, men, even when they do not require one another's help, desire to live together; not but that they are also brought together by their common interests in proportion as they severally attain to any measure of well-being. This is certainly the chief end, both of individuals and of states. And also for the sake of mere life (in which there is possibly some noble element so long as the evils of existence do not greatly overbalance the good) mankind meet together and maintain the political community. And we all see that men cling to life even at the cost of enduring great misfortune, seeming to find in life a natural sweetness and happiness.

There is no difficulty in distinguishing the various kinds of authority; they have been often defined already in discussions outside the school. The rule of a master, although the slave by nature and the master by nature have in reality the same interests, is nevertheless

exercised primarily with a view to the interest of the master, but accidentally considers the slave, since, if the slave perish, the rule of the master perishes with him. On the other hand, the government of a wife and children and of a household, which we have called household management, is exercised in the first instance for the good of the governed or for the common good of both parties, but essentially for the good of the governed, as we see to be the case in medicine, gymnastic, and the arts in general, which are only accidentally concerned with the good of the artists themselves. For there is no reason why the trainer may not sometimes practice gymnastics, and the helmsman is always one of the crew. The trainer or the helmsman considers the good of those committed to his care. But, when he is one of the persons taken care of, he accidentally participates in the advantage, for the helmsman is also a sailor, and the trainer becomes one of those in training. And so in politics: when the state is framed upon the principle of equality and likeness, the citizens think that they ought to hold office by turns. Formerly, as is natural, every one would take his turn of service; and then again, somebody else would look after his interest, just as he, while in office, had looked after theirs. But nowadays, for the sake of the advantage which is to be gained from the public revenues and from office, men want to be always in office. One might imagine that the rulers, being sickly, were only kept in health while they continued in office; in that case we may be sure that they would be hunting after places. The conclusion is evident: that governments which have a regard to the common interest are constituted in accordance with strict principles of justice, and are therefore true forms; but those which regard only the interest of the rulers are all defective and perverted forms, for they are despotic, whereas a state is a community of freemen.

Part VII

Having determined these points, we have next to consider how many forms of government there are, and what they are; and in the first place what are the true forms, for when they are determined the perversions of them will at once be apparent. The words constitution and government have the same meaning, and the government, which is the supreme authority in states, must be in the hands of one, or of a few, or of the many. The true forms of government, therefore, are those in which the one, or the few, or the many, govern with a view to the common interest; but governments which rule with a view to the private interest, whether of the one or of the few, or of the many, are perversions. For the members of a state, if they are truly citizens, ought to participate in its advantages. Of forms of government in which one rules, we call that which regards the common interests, kingship or royalty; that in which more than one, but not many, rule, aristocracy; and it is so called, either because the rulers are the best men, or because they have at heart the best interests of the state and of the citizens. But when the citizens at large administer the state for the common interest, the government is called by the generic name—a constitution. And there is a reason for this use of language. One man or a few may excel in virtue; but as the number increases it becomes more difficult for them to attain perfection in every kind of virtue, though they may in military virtue, for this is found in the masses. Hence in a constitutional government the fighting-men have the supreme power, and those who possess arms are the citizens.

Of the above-mentioned forms, the perversions are as follows: of royalty, tyranny; of aristocracy, oligarchy; of constitutional government, democracy. For tyranny is a kind of monarchy which has in view the interest of the monarch only; oligarchy has in view the interest of the wealthy; democracy, of the needy: none of them the

common good of all.

Part VIII

But there are difficulties about these forms of government, and it will therefore be necessary to state a little more at length the nature of each of them. For he who would make a philosophical study of the various sciences, and does not regard practice only, ought not to overlook or omit anything, but to set forth the truth in every particular. Tyranny, as I was saying, is monarchy exercising the rule of a master over the political society; oligarchy is when men of property have the government in their hands; democracy, the opposite, when the indigent, and not the men of property, are the rulers. And here arises the first of our difficulties, and it relates to the distinction drawn. For democracy is said to be the government of the many. But what if the many are men of property and have the power in their hands? In like manner oligarchy is said to be the government of the few; but what if the poor are fewer than the rich, and have the power in their hands because they are stronger? In these cases the distinction which we have drawn between these different forms of government would no longer hold good.

Suppose, once more, that we add wealth to the few and poverty to the many, and name the governments accordingly—an oligarchy is said to be that in which the few and the wealthy, and a democracy that in which the many and the poor are the rulers—there will still be a difficulty. For, if the only forms of government are the ones already mentioned, how shall we describe those other governments also just mentioned by us, in which the rich are the more numerous and the poor are the fewer, and both govern in their respective states?

The argument seems to show that, whether in oligarchies or in democracies, the number of the governing body, whether the greater number, as in a democracy, or the smaller number, as in an oligarchy,

is an accident due to the fact that the rich everywhere are few, and the poor numerous. But if so, there is a misapprehension of the causes of the difference between them. For the real difference between democracy and oligarchy is poverty and wealth. Wherever men rule by reason of their wealth, whether they be few or many, that is an oligarchy, and where the poor rule, that is a democracy. But as a fact the rich are few and the poor many; for few are well-to-do, whereas freedom is enjoyed by all, and wealth and freedom are the grounds on which the oligarchical and democratical parties respectively claim power in the state.

Part IX

Let us begin by considering the common definitions of oligarchy and democracy, and what is justice oligarchical and democratical. For all men cling to justice of some kind, but their conceptions are imperfect and they do not express the whole idea. For example, justice is thought by them to be, and is, equality, not, however, for all, but only for equals. And inequality is thought to be, and is, justice; neither is this for all, but only for unequals. When the persons are omitted, then men judge erroneously. The reason is that they are passing judgment on themselves, and most people are bad judges in their own case. And whereas justice implies a relation to persons as well as to things, and a just distribution, as I have already said in the *Ethics*, implies the same ratio between the persons and between the things, they agree about the equality of the things, but dispute about the equality of the persons, chiefly for the reason which I have just given—because they are bad judges in their own affairs; and secondly, because both the parties to the argument are speaking of a limited and partial justice, but imagine themselves to be speaking of absolute justice. For the one party, if they are unequal in one respect, for example wealth, consider themselves to be unequal in all; and the other party, if they are equal in one respect, for example free birth, consider themselves to be equal in all. But they leave out the capital point. For if men met and associated out of regard to wealth only, their share in the state would be proportioned to their property, and the oligarchical doctrine would then seem to carry the day. It would not be just that he who paid one mina should have the same share of a hundred minae, whether of the principal or of the profits, as he who paid the remaining ninety-nine. But a state exists for the sake of a good life, and not for the sake of life only: if life only were the object, slaves and brute animals might form a state, but they cannot, for they have no share in happiness or in a life of free choice. Nor does a state

exist for the sake of alliance and security from injustice, nor yet for the sake of exchange and mutual intercourse; for then the Tyrrhenians and the Carthaginians, and all who have commercial treaties with one another, would be the citizens of one state. True, they have agreements about imports, and engagements that they will do no wrong to one another, and written articles of alliance. But there are no magistrates common to the contracting parties who will enforce their engagements; different states have each their own magistracies. Nor does one state take care that the citizens of the other are such as they ought to be, nor see that those who come under the terms of the treaty do no wrong or wickedness at all, but only that they do no injustice to one another. Whereas, those who care for good government take into consideration virtue and vice in states. Whence it may be further inferred that virtue must be the care of a state which is truly so called, and not merely enjoys the name: for without this end the community becomes a mere alliance which differs only in place from alliances of which the members live apart; and law is only a convention, “a surety to one another of justice,” as the sophist Lycophron says, and has no real power to make the citizens good and just.

This is obvious; for suppose distinct places, such as Corinth and Megara, to be brought together so that their walls touched, still they would not be one city, not even if the citizens had the right to intermarry, which is one of the rights peculiarly characteristic of states. Again, if men dwelt at a distance from one another, but not so far off as to have no intercourse, and there were laws among them that they should not wrong each other in their exchanges, neither would this be a state. Let us suppose that one man is a carpenter, another a husbandman, another a shoemaker, and so on, and that their number is ten thousand: nevertheless, if they have nothing in common but exchange, alliance, and the like, that would not constitute a state. Why is this? Surely not because they are at a distance from one another: for even supposing that such a community

were to meet in one place, but that each man had a house of his own, which was in a manner his state, and that they made alliance with one another, but only against evil-doers; still an accurate thinker would not deem this to be a state, if their intercourse with one another was of the same character after as before their union. It is clear then that a state is not a mere society, having a common place, established for the prevention of mutual crime and for the sake of exchange. These are conditions without which a state cannot exist; but all of them together do not constitute a state, which is a community of families and aggregations of families in well-being, for the sake of a perfect and self-sufficing life. Such a community can only be established among those who live in the same place and intermarry. Hence arise in cities family connections, brotherhoods, common sacrifices, amusements which draw men together. But these are created by friendship, for the will to live together is friendship^[3]. The end of the state is the good life, and these are the means towards it. And the state is the union of families and villages in a perfect and self-sufficing life, by which we mean a happy and honorable life.

Our conclusion, then, is that political society exists for the sake of noble actions, and not of mere companionship. Hence they who contribute most to such a society have a greater share in it than those who have the same or a greater freedom or nobility of birth but are inferior to them in political virtue; or than those who exceed them in wealth but are surpassed by them in virtue.

From what has been said it will be clearly seen that all the partisans of different forms of government speak of a part of justice only.

Part X

There is also a doubt as to what is to be the supreme power in the state: Is it the multitude? Or the wealthy? Or the good? Or the one best man? Or a tyrant? Any of these alternatives seems to involve disagreeable consequences. If the poor, for example, because they are more in number, divide among themselves the property of the rich—is not this unjust? No, by heaven (will be the reply), for the supreme authority justly willed it. But if this is not injustice, pray what is? Again, when in the first division all has been taken, and the majority divide anew the property of the minority, is it not evident, if this goes on, that they will ruin the state? Yet surely, virtue is not the ruin of those who possess her, nor is justice destructive of a state; and therefore this law of confiscation clearly cannot be just. If it were, all the acts of a tyrant must of necessity be just; for he only coerces other men by superior power, just as the multitude coerce the rich. But is it just then that the few and the wealthy should be the rulers? And what if they, in like manner, rob and plunder the people—is this just? if so, the other case will likewise be just. But there can be no doubt that all these things are wrong and unjust.

Then ought the good to rule and have supreme power? But in that case everybody else, being excluded from power, will be dishonored. For the offices of a state are posts of honor; and if one set of men always holds them, the rest must be deprived of them. Then will it be well that the one best man should rule? Nay, that is still more oligarchical, for the number of those who are dishonored is thereby increased. Someone may say that it is bad in any case for a man, subject as he is to all the accidents of human passion, to have the supreme power, rather than the law. But what if the law itself be democratical or oligarchical, how will that help us out of our difficulties? Not at all; the same consequences will follow.

Part XI

Most of these questions may be reserved for another occasion. The principle that the multitude ought to be supreme rather than the few best is one that is maintained, and, though not free from difficulty, yet seems to contain an element of truth. For the many, of whom each individual is but an ordinary person, when they meet together may very likely be better than the few good, if regarded not individually but collectively, just as a feast to which many contribute is better than a dinner provided out of a single purse. For each individual among the many has a share of virtue and prudence, and when they meet together, they become in a manner one man, who has many feet, and hands, and senses; that is a figure of their mind and disposition. Hence the many are better judges than a single man of music and poetry; for some understand one part, and some another, and among them they understand the whole. There is a similar combination of qualities in good men, who differ from any individual of the many, as the beautiful are said to differ from those who are not beautiful, and works of art from realities, because in them the scattered elements are combined, although, if taken separately, the eye of one person or some other feature in another person would be fairer than in the picture. Whether this principle can apply to every democracy, and to all bodies of men, is not clear. Or rather, by heaven, in some cases it is impossible of application; for the argument would equally hold about brutes; and wherein, it will be asked, do some men differ from brutes? But there may be bodies of men about whom our statement is nevertheless true. And if so, the difficulty which has been already raised, and also another which is akin to it—viz., what power should be assigned to the mass of freemen and citizens, who are not rich and have no personal merit—are both solved. There is still a danger in allowing them to share the great offices of state, for their folly will lead them into error, and their

dishonesty into crime. But there is a danger also in not letting them share, for a state in which many poor men are excluded from office will necessarily be full of enemies. The only way of escape is to assign to them some deliberative and judicial functions. For this reason Solon and certain other legislators give them the power of electing to offices, and of calling the magistrates to account, but they do not allow them to hold office singly. When they meet together their perceptions are quite good enough, and combined with the better class they are useful to the state (just as impure food when mixed with what is pure sometimes makes the entire mass more wholesome than a small quantity of the pure would be), but each individual, left to himself, forms an imperfect judgment. On the other hand, the popular form of government involves certain difficulties. In the first place, it might be objected that he who can judge of the healing of a sick man would be one who could himself heal his disease, and make him whole—that is, in other words, the physician; and so in all professions and arts. As, then, the physician ought to be called to account by physicians, so ought men in general to be called to account by their peers. But physicians are of three kinds: there is the ordinary practitioner, and there is the physician of the higher class, and thirdly the intelligent man who has studied the art: in all arts there is such a class; and we attribute the power of judging to them quite as much as to professors of the art. Secondly, does not the same principle apply to elections? For a right election can only be made by those who have knowledge; those who know geometry, for example, will choose a geometrician rightly, and those who know how to steer, a pilot; and, even if there be some occupations and arts in which private persons share in the ability to choose, they certainly cannot choose better than those who know. So that, according to this argument, neither the election of magistrates, nor the calling of them to account, should be entrusted to the many. Yet possibly these objections are to a great extent met by our old answer, that if the people are not utterly degraded, although individually they may be worse judges than those who have special

knowledge—as a body they are as good or better. Moreover, there are some arts whose products are not judged of solely, or best, by the artists themselves, namely those arts whose products are recognized even by those who do not possess the art; for example, the knowledge of the house is not limited to the builder only; the user, or, in other words, the master, of the house will be even a better judge than the builder, just as the pilot will judge better of a rudder than the carpenter, and the guest will judge better of a feast than the cook.

This difficulty seems now to be sufficiently answered, but there is another akin to it. That inferior persons should have authority in greater matters than the good would appear to be a strange thing, yet the election and calling to account of the magistrates is the greatest of all. And these, as I was saying, are functions which in some states are assigned to the people, for the assembly is supreme in all such matters. Yet persons of any age, and having but a small property qualification, sit in the assembly and deliberate and judge, although for the great officers of state, such as treasurers and generals, a high qualification is required. This difficulty may be solved in the same manner as the preceding, and the present practice of democracies may be really defensible. For the power does not reside in the dicast, or senator, or ecclesiast, but in the court, and the senate, and the assembly, of which individual senators, or ecclesiasts, or dicasts, are only parts or members. And for this reason the many may claim to have a higher authority than the few; for the people, and the senate, and the courts consist of many persons, and their property collectively is greater than the property of one or of a few individuals holding great offices. But enough of this.

The discussion of the first question shows nothing so clearly as that laws, when good, should be supreme; and that the magistrate or magistrates should regulate those matters only on which the laws are unable to speak with precision owing to the difficulty of any general

principle embracing all particulars. But what are good laws has not yet been clearly explained; the old difficulty remains. The goodness or badness, justice or injustice, of laws varies of necessity with the constitutions of states. This, however, is clear, that the laws must be adapted to the constitutions. But if so, true forms of government will of necessity have just laws, and perverted forms of government will have unjust laws.

Part XII

In all sciences and arts the end is a good, and the greatest good and in the highest degree a good in the most authoritative of all—this is the political science of which the good is justice^[4], in other words, the common interest. All men think justice to be a sort of equality; and to a certain extent they agree in the philosophical distinctions which have been laid down by us about Ethics. For they admit that justice is a thing and has a relation to persons, and that equals ought to have equality. But there still remains a question: equality or inequality of what? Here is a difficulty which calls for political speculation. For very likely some persons will say that offices of state ought to be unequally distributed according to superior excellence, in whatever respect, of the citizen, although there is no other difference between him and the rest of the community; for that those who differ in any one respect have different rights and claims. But, surely, if this is true, the complexion or height of a man, or any other advantage, will be a reason for his obtaining a greater share of political rights. The error here lies upon the surface, and may be illustrated from the other arts and sciences. When a number of flute-players are equal in their art, there is no reason why those of them who are better born should have better flutes given to them; for they will not play any better on the flute, and the superior instrument should be reserved for him who is the superior artist. If what I am saying is still obscure, it will be made clearer as we proceed. For if there were a superior flute-player who was far inferior in birth and beauty, although either of these may be a greater good than the art of flute-playing, and may excel flute-playing in a greater ratio than he excels the others in his art, still he ought to have the best flutes given to him, unless the advantages of wealth and birth contribute to excellence in flute-playing, which they do not. Moreover, upon this principle any good may be compared with any other. For if a given height may be

measured against wealth and against freedom, height in general may be so measured. Thus if A excels in height more than B in virtue, even if virtue in general excels height still more, all goods will be commensurable; for if a certain amount is better than some other, it is clear that some other will be equal. But since no such comparison can be made, it is evident that there is good reason why in politics men do not ground their claim to office on every sort of inequality any more than in the arts. For if some be slow, and others swift, that is no reason why the one should have little and the others much; it is in gymnastics contests that such excellence is rewarded. Whereas the rival claims of candidates for office can only be based on the possession of elements which enter into the composition of a state. And therefore the noble, or freeborn, or rich, may with good reason claim office; for holders of offices must be freemen and taxpayers: a state can be no more composed entirely of poor men than entirely of slaves. But if wealth and freedom are necessary elements, justice and valor are equally so; for without the former qualities a state cannot exist at all, without the latter not well.

Part XIII

If the existence of the state is alone to be considered, then it would seem that all, or some at least, of these claims are just; but, if we take into account a good life, then, as I have already said, education and virtue have superior claims. As, however, those who are equal in one thing ought not to have an equal share in all, nor those who are unequal in one thing to have an unequal share in all, it is certain that all forms of government which rest on either of these principles are perversions. All men have a claim in a certain sense, as I have already admitted, but all have not an absolute claim. The rich claim because they have a greater share in the land, and land is the common element of the state; also they are generally more trustworthy in contracts. The free claim under the same tide as the noble; for they are nearly akin. For the noble are citizens in a truer sense than the ignoble, and good birth is always valued in a man's own home and country. Another reason is, that those who are sprung from better ancestors are likely to be better men, for nobility is excellence of race. Virtue, too, may be truly said to have a claim, for justice has been acknowledged by us to be a social virtue, and it implies all others. Again, the many may urge their claim against the few; for, when taken collectively, and compared with the few, they are stronger and richer and better. But, what if the good, the rich, the noble, and the other classes who make up a state, are all living together in the same city, will there, or will there not, be any doubt who shall rule? No doubt at all in determining who ought to rule in each of the above-mentioned forms of government. For states are characterized by differences in their governing bodies—one of them has a government of the rich, another of the virtuous, and so on. But a difficulty arises when all these elements coexist. How are we to decide? Suppose the virtuous to be very few in number: may we consider their numbers in relation to their duties, and ask whether

they are enough to administer the state, or so many as will make up a state? Objections may be urged against all the aspirants to political power. For those who found their claims on wealth or family might be thought to have no basis of justice; on this principle, if any one person were richer than all the rest, it is clear that he ought to be ruler of them. In like manner he who is very distinguished by his birth ought to have the superiority over all those who claim on the ground that they are freeborn. In an aristocracy, or government of the best, a like difficulty occurs about virtue; for if one citizen be better than the other members of the government, however good they may be, he too, upon the same principle of justice, should rule over them. And if the people are to be supreme because they are stronger than the few, then if one man, or more than one, but not a majority, is stronger than the many, they ought to rule, and not the many.

All these considerations appear to show that none of the principles on which men claim to rule and to hold all other men in subjection to them are strictly right. To those who claim to be masters of the government on the ground of their virtue or their wealth, the many might fairly answer that they themselves are often better and richer than the few—I do not say individually, but collectively. And another ingenious objection which is sometimes put forward may be met in a similar manner. Some persons doubt whether the legislator who desires to make the justest laws ought to legislate with a view to the good of the higher classes or of the many, when the case which we have mentioned occurs. Now what is just or right is to be interpreted in the sense of “what is equal”; and that which is right in the sense of being equal is to be considered with reference to the advantage of the state, and the common good of the citizens. And a citizen is one who shares in governing and being governed. He differs under different forms of government, but in the best state he is one who is able and willing to be governed and to govern with a view to the life of virtue.

If, however, there be some one person, or more than one, although not enough to make up the full complement of a state, whose virtue is so preeminent that the virtues or the political capacity of all the rest admit of no comparison with his or theirs, he or they can be no longer regarded as part of a state; for justice will not be done to the superior, if he is reckoned only as the equal of those who are so far inferior to him in virtue and in political capacity. Such an one may truly be deemed a God among men. Hence we see that legislation is necessarily concerned only with those who are equal in birth and in capacity; and that for men of preeminent virtue there is no law—they are themselves a law. Any one would be ridiculous who attempted to make laws for them: they would probably retort what, in the fable of Antisthenes, the lions said to the hares, when in the council of the beasts the latter began haranguing and claiming equality for all. And for this reason democratic states have instituted ostracism; equality is above all things their aim, and therefore they ostracized and banished from the city for a time those who seemed to predominate too much through their wealth, or the number of their friends, or through any other political influence. Mythology tells us that the Argonauts left Heracles behind for a similar reason; the ship Argo would not take him because she feared that he would have been too much for the rest of the crew. Wherefore those who denounce tyranny and blame the counsel which Periander gave to Thrasybulus cannot be held altogether just in their censure. The story is that Periander, when the herald was sent to ask counsel of him, said nothing, but only cut off the tallest ears of corn till he had brought the field to a level. The herald did not know the meaning of the action, but came and reported what he had seen to Thrasybulus, who understood that he was to cut off the principal men in the state; and this is a policy not only expedient for tyrants or in practice confined to them, but equally necessary in oligarchies and democracies. Ostracism is a measure of the same kind, which acts by disabling and banishing the most prominent citizens. Great powers do the same to whole cities and

nations, as the Athenians did to the Samians, Chians, and Lesbians; no sooner had they obtained a firm grasp of the empire, than they humbled their allies contrary to treaty; and the Persian king has repeatedly crushed the Medes, Babylonians, and other nations, when their spirit has been stirred by the recollection of their former greatness.

The problem is a universal one, and equally concerns all forms of government, true as well as false; for, although perverted forms with a view to their own interests may adopt this policy, those which seek the common interest do so likewise. The same thing may be observed in the arts and sciences; for the painter will not allow the figure to have a foot which, however beautiful, is not in proportion, nor will the ship-builder allow the stem or any other part of the vessel to be unduly large, any more than the chorus-master will allow anyone who sings louder or better than all the rest to sing in the choir. Monarchs, too, may practice compulsion and still live in harmony with their cities, if their own government is for the interest of the state. Hence where there is an acknowledged superiority the argument in favor of ostracism is based upon a kind of political justice. It would certainly be better that the legislator should from the first so order his state as to have no need of such a remedy. But if the need arises, the next best thing is that he should endeavor to correct the evil by this or some similar measure. The principle, however, has not been fairly applied in states; for, instead of looking to the good of their own constitution, they have used ostracism for factious purposes. It is true that under perverted forms of government, and from their special point of view, such a measure is just and expedient, but it is also clear that it is not absolutely just. In the perfect state there would be great doubts about the use of it, not when applied to excess in strength, wealth, popularity, or the like, but when used against someone who is preeminent in virtue—what is to be done with him? Mankind will not say that such an one is to be expelled and exiled; on the other hand,

he ought not to be a subject—that would be as if mankind should claim to rule over Zeus, dividing his offices among them. The only alternative is that all should joyfully obey such a ruler, according to what seems to be the order of nature, and that men like him should be kings in their state for life.

Part XIV

The preceding discussion, by a natural transition, leads to the consideration of royalty, which we admit to be one of the true forms of government. Let us see whether in order to be well governed a state or country should be under the rule of a king or under some other form of government; and whether monarchy, although good for some, may not be bad for others. But first we must determine whether there is one species of royalty or many. It is easy to see that there are many, and that the manner of government is not the same in all of them.

Of royalties according to law, (1) the Lacedaemonian is thought to answer best to the true pattern; but there the royal power is not absolute, except when the kings go on an expedition, and then they take the command. Matters of religion are likewise committed to them. The kingly office is in truth a kind of generalship, irresponsible and perpetual. The king has not the power of life and death, except in a specified case, as for instance, in ancient times, he had it when upon a campaign, by right of force. This custom is described in Homer. For Agamemnon is patient when he is attacked in the assembly, but when the army goes out to battle he has the power even of life and death. Does he not say—"When I find a man skulking apart from the battle, nothing shall save him from the dogs and vultures, for in my hands is death"?

This, then, is one form of royalty—a generalship for life: and of such royalties some are hereditary and others elective.

(2) There is another sort of monarchy not uncommon among the barbarians, which nearly resembles tyranny. But this is both legal and hereditary. For barbarians, being more servile in character than Hellenes, and Asiatics than Europeans, do not rebel against a despotic government. Such royalties have the nature of tyrannies because the

people are by nature slaves; but there is no danger of their being overthrown, for they are hereditary and legal. Wherefore also their guards are such as a king and not such as a tyrant would employ, that is to say, they are composed of citizens, whereas the guards of tyrants are mercenaries. For kings rule according to law over voluntary subjects, but tyrants over involuntary; and the one are guarded by their fellowcitizens the others are guarded against them.

These are two forms of monarchy, and there was a third (3) which existed in ancient Hellas, called an Aesymnetia or dictatorship. This may be defined generally as an elective tyranny, which, like the barbarian monarchy, is legal, but differs from it in not being hereditary. Sometimes the office was held for life, sometimes for a term of years, or until certain duties had been performed. For example, the Mytilenaeans elected Pittacus leader against the exiles, who were headed by Antimenides and Alcaeus the poet. And Alcaeus himself shows in one of his banquet odes that they chose Pittacus tyrant, for he reproaches his fellow-citizens for “having made the low-born Pittacus tyrant of the spiritless and ill-fated city, with one voice shouting his praises.”

These forms of government have always had the character of tyrannies, because they possess despotic power; but inasmuch as they are elective and acquiesced in by their subjects, they are kingly.

(4) There is a fourth species of kingly rule—that of the heroic times—which was hereditary and legal, and was exercised over willing subjects. For the first chiefs were benefactors of the people in arts or arms; they either gathered them into a community, or procured land for them; and thus they became kings of voluntary subjects, and their power was inherited by their descendants. They took the command in war and presided over the sacrifices, except those which required a priest. They also decided causes either with or without an oath; and when they swore, the form of the oath was the stretching

out of their sceptre. In ancient times their power extended continuously to all things whatsoever, in city and country, as well as in foreign parts; but at a later date they relinquished several of these privileges, and others the people took from them, until in some states nothing was left to them but the sacrifices; and where they retained more of the reality they had only the right of leadership in war beyond the border.

These, then, are the four kinds of royalty. First the monarchy of the heroic ages; this was exercised over voluntary subjects, but limited to certain functions; the king was a general and a judge, and had the control of religion. The second is that of the barbarians, which is a hereditary despotic government in accordance with law. A third is the power of the so-called Aesynmete or Dictator; this is an elective tyranny. The fourth is the Lacedaemonian, which is in fact a generalship, hereditary and perpetual. These four forms differ from one another in the manner which I have described.

(5) There is a fifth form of kingly rule in which one has the disposal of all, just as each nation or each state has the disposal of public matters; this form corresponds to the control of a household. For as household management is the kingly rule of a house, so kingly rule is the household management of a city, or of a nation, or of many nations.

Part XV

Of these forms we need only consider two, the Lacedaemonian and the absolute royalty; for most of the others lie in a region between them, having less power than the last, and more than the first. Thus the inquiry is reduced to two points: first, is it advantageous to the state that there should be a perpetual general, and if so, should the office be confined to one family, or open to the citizens in turn? Secondly, is it well that a single man should have the supreme power in all things? The first question falls under the head of laws rather than of constitutions; for perpetual generalship might equally exist under any form of government, so that this matter may be dismissed for the present. The other kind of royalty is a sort of constitution; this we have now to consider, and briefly to run over the difficulties involved in it. We will begin by inquiring whether it is more advantageous to be ruled by the best man or by the best laws.

The advocates of royalty maintain that the laws speak only in general terms, and cannot provide for circumstances; and that for any science to abide by written rules is absurd. In Egypt the physician is allowed to alter his treatment after the fourth day, but if sooner, he takes the risk. Hence it is clear that a government acting according to written laws is plainly not the best. Yet surely the ruler cannot dispense with the general principle which exists in law; and this is a better ruler which is free from passion than that in which it is innate. Whereas the law is passionless, passion must ever sway the heart of man. Yes, it may be replied, but then on the other hand an individual will be better able to deliberate in particular cases.

The best man, then, must legislate, and laws must be passed, but these laws will have no authority when they miss the mark, though in all other cases retaining their authority. But when the law cannot

determine a point at all, or not well, should the one best man or should all decide? According to our present practice assemblies meet, sit in judgment, deliberate, and decide, and their judgments are related to individual cases. Now any member of the assembly, taken separately, is certainly inferior to the wise man. But the state is made up of many individuals. And as a feast to which all the guests contribute is better than a banquet furnished by a single man, so a multitude is a better judge of many things than any individual.

Again, the many are more incorruptible than the few; they are like the greater quantity of water which is less easily corrupted than a little. The individual is liable to be overcome by anger or by some other passion, and then his judgment is necessarily perverted; but it is hardly to be supposed that a great number of persons would all get into a passion and go wrong at the same moment. Let us assume that they are the freemen, and that they never act in violation of the law, but fill up the gaps which the law is obliged to leave. Or, if such virtue is scarcely attainable by the multitude, we need only suppose that the majority are good men and good citizens, and ask which will be the more incorruptible, the one good ruler, or the many who are all good? Will not the many? But, you will say, there may be parties among them, whereas the one man is not divided against himself. To which we may answer that their character is as good as his. If we call the rule of many men, who are all of them good, aristocracy, and the rule of one man royalty, then aristocracy will be better for states than royalty, whether the government is supported by force or not, provided only that a number of men equal in virtue can be found.

The first governments were kingships, probably for this reason, because of old, when cities were small, men of eminent virtue were few. Further, they were made kings because they were benefactors, and benefits can only be bestowed by good men. But when many persons equal in merit arose, no longer enduring the preeminence of

one, they desired to have a commonwealth, and set up a constitution. The ruling class soon deteriorated and enriched themselves out of the public treasury; riches became the path to honor, and so oligarchies naturally grew up. These passed into tyrannies and tyrannies into democracies; for love of gain in the ruling classes was always tending to diminish their number, and so to strengthen the masses, who in the end set upon their masters and established democracies. Since cities have increased in size, no other form of government appears to be any longer even easy to establish.

Even supposing the principle to be maintained that kingly power is the best thing for states, how about the family of the king? Are his children to succeed him? If they are no better than anybody else, that will be mischievous. But, says the lover of royalty, the king, though he might, will not hand on his power to his children. That, however, is hardly to be expected, and is too much to ask of human nature. There is also a difficulty about the force which he is to employ; should a king have guards about him by whose aid he may be able to coerce the refractory? If not, how will he administer his kingdom? Even if he be the lawful sovereign who does nothing arbitrarily or contrary to law, still he must have some force wherewith to maintain the law. In the case of a limited monarchy there is not much difficulty in answering this question; the king must have such force as will be more than a match for one or more individuals, but not so great as that of the people. The ancients observe this principle when they have guards to anyone whom they appointed dictator or tyrant. Thus, when Dionysius asked the Syracusans to allow him guards, somebody advised that they should give him only such a number.

Part XVI

At this place in the discussion there impends the inquiry respecting the king who acts solely according to his own will; he has now to be considered. The so-called limited monarchy, or kingship according to law, as I have already remarked, is not a distinct form of government, for under all governments, as, for example, in a democracy or aristocracy, there may be a general holding office for life, and one person is often made supreme over the administration of a state. A magistracy of this kind exists at Epidamnus, and also at Opus, but in the latter city has a more limited power. Now, absolute monarchy, or the arbitrary rule of a sovereign over the citizens, in a city which consists of equals, is thought by some to be quite contrary to nature; it is argued that those who are by nature equals must have the same natural right and worth, and that for unequals to have an equal share, or for equals to have an uneven share, in the offices of state, is as bad as for different bodily constitutions to have the same food and clothing. Wherefore it is thought to be just that among equals everyone be ruled as well as rule, and therefore that an should have their turn. We thus arrive at law; for an order of succession implies law. And the rule of the law, it is argued, is preferable to that of any individual. On the same principle, even if it be better for certain individuals to govern, they should be made only guardians and ministers of the law. For magistrates there must be—this is admitted; but then men say that to give authority to any one man when all are equal is unjust. Nay, there may indeed be cases which the law seems unable to determine, but in such cases can a man? Nay, it will be replied, the law trains officers for this express purpose, and appoints them to determine matters which are left undecided by it, to the best of their judgment. Further, it permits them to make any amendment of the existing laws which experience suggests. Therefore he who bids the law rule may be deemed to bid

God and Reason alone rule, but he who bids man rule adds an element of the beast; for desire is a wild beast, and passion^[5] perverts the minds of rulers, even when they are the best of men. The law is reason unaffected by desire. We are told that a patient should call in a physician; he will not get better if he is doctored out of a book. But the parallel of the arts is clearly not in point; for the physician does nothing contrary to rule from motives of friendship; he only cures a patient and takes a fee; whereas magistrates do many things from spite and partiality. And, indeed, if a man suspected the physician of being in league with his enemies to destroy him for a bribe, he would rather have recourse to the book. But certainly physicians, when they are sick, call in other physicians, and training-masters, when they are in training, other training-masters, as if they could not judge truly about their own case and might be influenced by their feelings. Hence it is evident that in seeking for justice men seek for the mean or neutral, for the law is the mean. Again, customary laws have more weight, and relate to more important matters, than written laws, and a man may be a safer ruler than the written law, but not safer than the customary law.

Again, it is by no means easy for one man to superintend many things; he will have to appoint a number of subordinates, and what difference does it make whether these subordinates always existed or were appointed by him because he needed them? If, as I said before, the good man has a right to rule because he is better, still two good men are better than one: this is the old saying, two going together, and the prayer of Agamemnon,

“Would that I had ten such councillors!”

And at this day there are magistrates, for example judges, who have authority to decide some matters which the law is unable to determine, since no one doubts that the law would command and decide in the best manner whatever it could. But some things can, and

other things cannot, be comprehended under the law, and this is the origin of the nexted question whether the best law or the best man should rule. For matters of detail about which men deliberate cannot be included in legislation. Nor does any one deny that the decision of such matters must be left to man, but it is argued that there should be many judges, and not one only. For every ruler who has been trained by the law judges well; and it would surely seem strange that a person should see better with two eyes, or hear better with two ears, or act better with two hands or feet, than many with many; indeed, it is already the practice of kings to make to themselves many eyes and ears and hands and feet. For they make colleagues of those who are the friends of themselves and their governments. They must be friends of the monarch and of his government; if not his friends, they will not do what he wants; but friendship implies likeness and equality; and, therefore, if he thinks that his friends ought to rule, he must think that those who are equal to himself and like himself ought to rule equally with himself. These are the principal controversies relating to monarchy.

Part XVII

But may not all this be true in some cases and not in others? For there is by nature both a justice and an advantage appropriate to the rule of a master, another to kingly rule, another to constitutional rule; but there is none naturally appropriate to tyranny, or to any other perverted form of government; for these come into being contrary to nature. Now, to judge at least from what has been said, it is manifest that, where men are alike and equal, it is neither expedient nor just that one man should be lord of all, whether there are laws, or whether there are no laws, but he himself is in the place of law. Neither should a good man be lord over good men, nor a bad man over bad; nor, even if he excels in virtue, should he have a right to rule, unless in a particular case, at which I have already hinted, and to which I will once more recur. But first of all, I must determine what natures are suited for government by a king, and what for an aristocracy, and what for a constitutional government.

A people who are by nature capable of producing a race superior in the virtue needed for political rule are fitted for kingly government; and a people submitting to be ruled as freemen by men whose virtue renders them capable of political command are adapted for an aristocracy; while the people who are suited for constitutional freedom are those among whom there naturally exists a warlike multitude able to rule and to obey in turn by a law which gives office to the well-to-do according to their desert. But when a whole family or some individual, happens to be so preeminent in virtue as to surpass all others, then it is just that they should be the royal family and supreme over all, or that this one citizen should be king of the whole nation. For, as I said before, to give them authority is not only agreeable to that ground of right which the founders of all states, whether aristocratical, or oligarchical, or again democratical, are

accustomed to put forward (for these all recognize the claim of excellence, although not the same excellence), but accords with the principle already laid down. For surely it would not be right to kill, or ostracize, or exile such a person, or require that he should take his turn in being governed. The whole is naturally superior to the part, and he who has this preeminence is in the relation of a whole to a part. But if so, the only alternative is that he should have the supreme power, and that mankind should obey him, not in turn, but always. These are the conclusions at which we arrive respecting royalty and its various forms, and this is the answer to the question, whether it is or is not advantageous to states, and to which, and how.

Part XVIII

We maintain that the true forms of government are three, and that the best must be that which is administered by the best, and in which there is one man, or a whole family, or many persons, excelling all the others together in virtue, and both rulers and subjects are fitted, the one to rule, the others to be ruled, in such a manner as to attain the most eligible life. We showed at the commencement of our inquiry that the virtue of the good man is necessarily the same as the virtue of the citizen of the perfect state. Clearly then in the same manner, and by the same means through which a man becomes truly good, he will frame a state that is to be ruled by an aristocracy or by a king, and the same education and the same habits will be found to make a good man and a man fit to be a statesman or a king.

Having arrived at these conclusions, we must proceed to speak of the perfect state, and describe how it comes into being and is established.

[3] Friendship：友爱，在亚里士多德那里是一个重要概念，在《尼各马可伦理学》中亚里士多德花了两卷的篇幅讨论了这个概念。友爱在亚里士多德看来是人生活中必需的东西，一个人无论拥有多大的财富、权力与荣誉，如果没有朋友与之分享，那也称不上幸福。友爱不仅是必要的，同时还是高贵的。尤其是对于城邦共同体来说，友爱更是联结公民之间的纽带，城邦的团结就在于友爱。如果公民之间都是朋友，那么他们甚至就不需要公正了，而一个公正的城邦依然需要友爱。亚里士多德还认为相应于三种政体形式，也有对应的三种类型的友爱。君主制中君主为公民谋利，有点儿类似于父亲对儿女的友爱，父权似的政体，这种友爱是不平等的。贵族制类似于夫妻之间的友爱，相应于男女各自的德性，较好得多。而共和制类似于兄弟间的友爱，相互之间是彻底平等的。

[4] Justice：公正，亚里士多德认为一个公正的人不仅仅对自己运用德性，还总是对他人运用德性。所以公正由于其总是能促进他人的利益，因而是一种与他人相关的德性。在这个意义上，公正是对另一个人关系上的德性的总体。亚里士多德把公正分为分配公正与矫正公正。前者遵循的是一种几何上的比例平等，即要根据对象的具体情况给予差别对待，也就是说给平等者以平等的对待，给不平等的人以不平等的对待，城邦中在公共财富分配时要遵循这个原则。而矫正公正则适用于私人交易与司法审判的领域，遵循的是算数的比例平等，给一个人的所得要与其所失严格相等。

[5] Passion：激情，血气。柏拉图将灵魂分为三个部分，理性、激情与欲望。理性与欲望在某种程度上是相互冲突的，从相反的方向控制着人类行为的动机。而激情本身则是保持中立的，其既可以站在理性一边，也可以站在欲望一边。激情从原本的意义上讲，是一种因某种不正确的东西而使人们产生愤慨的能力。这种愤慨能驱使人们有极大的动机和力量去捍卫正确的东西。一旦人们相信何为正确，那么当这种正确被违反，由不正义引发的愤慨、激情就驱使人们为了纠正这种不正义而抗争，甚至是献身、牺牲。但问题是，激情本身并没有区分对与错、善与恶的能力，而只是愿意为任何一种显得是、似乎是正确的东西献身、牺牲。激情是人们投入政治生活的前提条件，因为只有人类具备有关正义的激情，人类才会积极投入到公共生活。但是激情本身也需要被节制，因为即使是对一种正确价值的坚守捍卫，如果没有保持适度，也会是极为危险的，比如说过于偏执于追求平等而导致多数人的暴政。即便是对正义的追求的激情，也应时刻受到理性的约束。

BOOK FOUR

导 读

在第三卷的结尾，亚里士多德提出要开始探讨最优良的政体，但是在第四卷的开头，亚里士多德将问题转换了。从探讨最优良的政体改为探讨切合实际的最优良政体是什么。最优良的政体的实现需要很多难得的条件，这样的政体为数不多。因而最紧要的是研究对一切城邦都切实可行的好的政体，以及如何通过改革将存在弊端的政体转变为好的政体。

想要做到上述这点，就必须清楚知道各种政体的类型，以及存在多种类型政体的原因。因为当我们明白了政体多样化类型的原因，我们也就明白了政体本身的本质。政体的多样化是因为每一个城邦都由各种部分组成。各个部分的相对实力对比、相互关系的排列组合，决定了政体具有多种类型。

每一个城邦内部都需要有各种职业、阶层来维持其存在，亚里士多德说一共有7类职业，这7类中有一部分，如农民、工匠，主要是为了维持城邦的基本生存，这部分人并不自然地参与城邦管理，因为他们自己的生活并不等同于公共生活。还有一部分阶层，如战士、司法、议事阶层，如同城邦的灵魂一样，更像是城邦的一部分，因为这种职业本身就等同于参与公共生活。除了各个职业的各个阶层划分之外，所有城邦都具有富人阶层与穷人阶层。富与穷这两个部分对于政体的种类划分来说更具有决定意义，以至于通常人都认为最主要的两种政体类型就是寡头制与平民制。

由此看来，城邦本身就是由利益多元乃至相互冲突的各个部分组成的。这种多元化不仅仅导致了寡头制与平民制的区分，还导致平民制、寡头制本身也存在多种类型。有的平民制中平民权力相对较大，有的平民制中平民权力相对较小。在有的平民权力过大以至于彻底将法律弃之一旁而不顾的地方，这样的平民制根本无法称为一个政体了，因为在失去法律的地方，政体也将不再存在。

这里重要的一点是，亚里士多德将政体的存在与法律相连。在接下来的对平民政体的各种形式的讨论中，亚里士多德突出地将闲暇与法律进行了一种相关性的分析。当一个城邦中的公民大多都忙于生计的时候，他们顾不上参与公共生活，无法经常开议事大会来决定各种事项，因而只能通过法律来进行统治。但是随着城邦的富裕，担任官职得到工资、穷人得到了津贴的情况下，不必着急忙于生计有着充裕闲暇的人们，往往会通过自己的统治来取代法律的统治。这里亚里士多德一改对于闲暇一直以来的正面态度，点出了闲暇可能造成的负面影响。闲暇使得人们充分发展了参与政治的能力、给予了人们参与政治的动机。但对于参与政治的过度的激情，使得人们抛弃了法治。亚里士多德在这里暗示着，对于政治的过分关注、对于公平的过度热衷，很可能导致城邦的覆灭。法律最大的功能就是克制人类不可避免的激情影响，同时法律也可以克制人们的政治激情。因而人们需要法律的统治来代替直接的政治统治。法治本身就意味着人们对于制定的优良的法律的自愿的服从，政治的激情在法治下自然就得到了驯化。
